**Über dieses Buch**

Dies ist ein digitales Exemplar eines Buches, das seit Generationen in den Regalen der Bibliotheken aufbewahrt wurde, bevor es von Google im Rahmen eines Projekts, mit dem die Bücher dieser Welt online verfügbar gemacht werden sollen, sorgfältig gescannt wurde.

Das Buch hat das Urheberrecht überdauert und kann nun öffentlich zugänglich gemacht werden. Ein öffentlich zugängliches Buch ist ein Buch, das niemals Urheberrechten unterlag oder bei dem die Schutzfrist des Urheberrechts abgelaufen ist. Ob ein Buch öffentlich zugänglich ist, kann von Land zu Land unterschiedlich sein. Öffentlich zugängliche Bücher sind unser Tor zur Vergangenheit und stellen ein geschichtliches, kulturelles und wissenschaftliches Vermögen dar, das häufig nur schwierig zu entdecken ist.

Gebrauchsspuren, Anmerkungen und andere Randbemerkungen, die im Originalband enthalten sind, finden sich auch in dieser Datei – eine Erinnerung an die lange Reise, die das Buch vom Verleger zu einer Bibliothek und weiter zu Ihnen hinter sich gebracht hat.

**Nutzungsrichtlinien**

Google ist stolz, mit Bibliotheken in partnerschaftlicher Zusammenarbeit öffentlich zugängliches Material zu digitalisieren und einer breiten Masse zugänglich zu machen. Öffentlich zugängliche Bücher gehören der Öffentlichkeit, und wir sind nur ihre Hüter. Nichtsdestotrotz ist diese Arbeit kostspielig. Um diese Ressource weiterhin zur Verfügung stellen zu können, haben wir Schritte unternommen, um den Missbrauch durch kommerzielle Parteien zu verhindern. Dazu gehören technische Einschränkungen für automatisierte Abfragen.

Wir bitten Sie um Einhaltung folgender Richtlinien:

+ *Nutzung der Dateien zu nichtkommerziellen Zwecken* Wir haben Google Buchsuche für Endanwender konzipiert und möchten, dass Sie diese Dateien nur für persönliche, nichtkommerzielle Zwecke verwenden.

+ *Keine automatisierten Abfragen* Senden Sie keine automatisierten Abfragen irgendwelcher Art an das Google-System. Wenn Sie Recherchen über maschinelle Übersetzung, optische Zeichenerkennung oder andere Bereiche durchführen, in denen der Zugang zu Text in großen Mengen nützlich ist, wenden Sie sich bitte an uns. Wir fördern die Nutzung des öffentlich zugänglichen Materials für diese Zwecke und können Ihnen unter Umständen helfen.

+ *Beibehaltung von Google-Markenelementen* Das "Wasserzeichen" von Google, das Sie in jeder Datei finden, ist wichtig zur Information über dieses Projekt und hilft den Anwendern weiteres Material über Google Buchsuche zu finden. Bitte entfernen Sie das Wasserzeichen nicht.

+ *Bewegen Sie sich innerhalb der Legalität* Unabhängig von Ihrem Verwendungszweck müssen Sie sich Ihrer Verantwortung bewusst sein, sicherzustellen, dass Ihre Nutzung legal ist. Gehen Sie nicht davon aus, dass ein Buch, das nach unserem Dafürhalten für Nutzer in den USA öffentlich zugänglich ist, auch für Nutzer in anderen Ländern öffentlich zugänglich ist. Ob ein Buch noch dem Urheberrecht unterliegt, ist von Land zu Land verschieden. Wir können keine Beratung leisten, ob eine bestimmte Nutzung eines bestimmten Buches gesetzlich zulässig ist. Gehen Sie nicht davon aus, dass das Erscheinen eines Buchs in Google Buchsuche bedeutet, dass es in jeder Form und überall auf der Welt verwendet werden kann. Eine Urheberrechtsverletzung kann schwerwiegende Folgen haben.

**Über Google Buchsuche**

Das Ziel von Google besteht darin, die weltweiten Informationen zu organisieren und allgemein nutzbar und zugänglich zu machen. Google Buchsuche hilft Lesern dabei, die Bücher dieser Welt zu entdecken, und unterstützt Autoren und Verleger dabei, neue Zielgruppen zu erreichen. Den gesamten Buchtext können Sie im Internet unter `http://books.google.com` durchsuchen.

This is a reproduction of a library book that was digitized by Google as part of an ongoing effort to preserve the information in books and make it universally accessible.

THE

# Tramway & Railway World

Vol. XXXIV. No. 1. LONDON, SATURDAY, JULY 5, 1913. [Established in 1892.

ANNUAL SUBSCRIPTION (Postage Prepaid)—in the United Kingdom, 25s.; for all places abroad, 30s.

Including sixty-four issues, of which twelve are large illustrated numbers, printed on fine art paper.

## NOTICES.

**All Communications and Advertisements for next Saturday's issue should be received not later than 3 p.m. on Friday.**

**Advertisements for the next issue of which proof is desired should reach us by the second post on Wednesday.**

**The Editorial and Publishing Offices of "The Tramway and Railway World" are at Amberley House, Norfolk Street, London, W.C.**

**Telegrams: "TRAMIGRO, LONDON."**
**Telephone: No. 2948 GERRARD.**

## WEEKLY LIST OF TENDERS INVITED.

### COMMONWEALTH OF AUSTRALIA.

TENDERS FOR STEEL RAILS, ETC.

Tenders will be received until 11 a.m. on Tuesday, August 19, for the manufacture and delivery of Steel Rails, etc., for the Pine Creek to Katherine River Railway.

Forms of tender, specifications, etc., may be purchased at the office of the High Commissioner for Australia, 72, Victoria Street, S.W. The charge for specifications will be one guinea and for each copy of plans 5s., which must be paid at the Commonwealth Offices before the documents can be handed over.

Tenders must be endorsed "Tenders for Material for Pine Creek to Katherine River Railway," and be addressed to the Secretary, Department of Home Affairs, Melbourne. They must be accompanied by the deposit mentioned in the form of tender.

(Sgd.) JOSEPH COOK,
Minister of State for Home Affairs.

### CITY AND COUNTY BOROUGH OF BELFAST.

TRAMWAYS AND ELECTRICITY DEPARTMENT.

The Tramways and Electricity Committee of the Belfast Corporation are prepared to receive tenders for the supply of a

3,500 Ampere Traction Switchboard Panel.

Specification with form of contract may be obtained from Mr. T. W. Bloxam, City Electrical Engineer, East Bridge Street, Belfast, on deposit of one guinea for each specification. This deposit will be refunded, provided a *bonâ-fide* tender has been sent in, and not withdrawn.

Extra copies may be obtained at 10s. each which sum will not be returnable.

Sealed tenders, endorsed "Tender for Switchboard Panel," to be lodged in my office not later than 10 a.m. on Monday, July 21, 1913.

The lowest or any tender not necessarily accepted.

A tender, if sent by post, must be registered; if delivered by hand an official receipt must be obtained for it, otherwise the undersigned will not be responsible.

R. MEYER,
Town Clerk.

Belfast.

### CORPORATION OF NUNEATON.

The Electricity Committee is prepared to receive tenders for the supply, delivery, and erection of

One Line Booster.

Specification, form of tender, and full particulars may be obtained on application to the undersigned.

Sealed tenders, endorsed "Tender for Booster," and addressed to "The Chairman of the Electricity Committee," Electricity Works, Coton Road, Nuneaton, must be delivered not later than 9 a.m. on Tuesday, July 15, 1913.

The Committee does not bind itself to accept the lowest or any tender.

S. CAMERON GIBSON,
Borough Electrical Engineer.

Electricity Works, Nuneaton.

### COUNTY OF LONDON.

The London County Council invites tenders for the purchase of Two 3,500 kw. Steam Generators, 6,600 volts, 25 periods per second, each set consisting of two Engines, one on each side of the Alternator, complete with Condenser and Air Pump.

Particulars and forms of tender for the purchase of all or any of the machinery may be obtained upon application, personally or by letter, to the Chief Officer, London County Council Tramways, 62, Finsbury Pavement, E.C.

Tenders must be upon the official forms, and the instructions therein must be strictly complied with. No tender received after 11 a.m. on Tuesday, July 15, 1913, will be considered.

The Council does not bind itself to accept the highest or any tender, and it will not accept the tender of any person or firm who has withdrawn a tender after the same had been opened, unless the reasons for withdrawal were satisfactory to the Council.

JAMES BIRD,
Deputy Clerk of the London County Council.

County Hall, Spring Gardens, S.W.,
June 28, 1913.

### COUNTY OF LONDON.

The London County Council invites tenders for the supply of 5 miles of 4/0 Grooved Trolley Wire.

Full particulars of the material required, form of tender, and conditions of contract, etc., may be obtained from the Chief Officer, London County Council Tramways, 62, Finsbury Pavement, E.C.

The contractor will be bound to pay to all workmen employed by him in and about the execution of the contract, or any part thereof, wages at rates not less, and to observe hours of labour not greater, than the rates and hours set out in the Council's list, and such rates of wages and hours of labour will be inserted in and form part of the contract by way of schedule. Full particulars of the Council's Standing Orders on these matters are given in the *London County Council Gazette*. Tenders must be upon the official forms and the instructions therein must be strictly complied with. No tender received after 11 a.m. on Tuesday, July 15, 1913, will be considered.

The Council does not bind itself to accept the lowest or any tender, and it will not accept the tender of any person or firm who has withdrawn a tender after the same had been opened, unless the reasons for withdrawal were satisfactory to the Council.

JAMES BIRD,
Deputy Clerk of the London County Council.

County Hall, Spring Gardens, S.W.,
July 2, 1913.

### COUNTY BOROUGH OF NEWPORT.

ELECTRICITY DEPARTMENT.

The Newport Corporation invite tenders for Additional Extra High Tension Switchgear.

Specifications, schedules, drawings, and form of tender, together with any further information that may be required, can be obtained from Mr. A. Nichols Moore, M.I.E.E., Borough Electrical Engineer, Town Hall, Newport, Mon., on and after Saturday, July 5, upon production of the receipt of the Borough Treasurer for the sum of 10s. 6d., which sum will be returned on receipt of a *bonâ-fide* tender.

Sealed tenders, endorsed "Additional E.H.T. Switchgear," addressed to the undersigned, are to be delivered either by hand or through the post not later than 10 a.m. on Saturday, July 19, 1913.

The Corporation do not bind themselves to accept the lowest or any tender.

Contractors will be required to pay the recognised rates of wages and observe the recognised hours and rules of labour in the district.

ALBERT A NEWMAN,
Town Clerk.

Town Hall, Newport, Mon.,
July 1, 1913

Digitized by Google

### LONDON—INDIA OFFICE.

The Secretary of State for India in Council is prepared to receive tenders from such persons as may be willing to supply :—

1. Switches and Crossings.
2. Railway Wagons.
3. Wheels and Axles.

The conditions of contract may be obtained on application to the Director-General of Stores, India Office, Whitehall, S.W., and tenders are to be delivered at that Office by 2 o'clock p.m. on Thursday, July 17, 1913, for No. 1, and on Tuesday, July 22, 1913, for Nos. 2 and 3, after which times respectively no tender will be received.

H. J. W. Fry,
Director-General of Stores.

India Office, Whitehall,
July 2, 1913.

### COUNTY BOROUGH OF SUNDERLAND.

OILSKINS.

The Corporation of Sunderland are prepared to receive tenders for and samples of Oilskins for Motormen.

Further particulars may be obtained on application to the General Manager, Tramways Offices, Monkwearmouth, Sunderland.

Tenders, in sealed envelopes, endorsed "Tender for Oilskins," addressed to the Chairman of the Tramways Committee, Town Hall, Sunderland, together with samples, must be delivered at my office not later than 12 o'clock noon on Thursday, the 31st day of July next.

The Corporation do not bind themselves to accept the lowest or any tender.

H. Craven,
Town Clerk.

Town Hall, Sunderland,
June 30, 1913.

### COUNTY BOROUGH OF WEST HARTLEPOOL.

TRAMWAYS DEPARTMENT.

Tenders are invited for the supply and laying of :—

A. Single Low Tension Paper Lead Cables.
B. Pilot and Telephone Cables.

Specification and form of tender can be obtained from the undersigned after Tuesday, July 8, 1913.

Sealed tenders, endorsed "Tramway Feeder Cables," must be delivered to Higson Simpson, Esq., Town Clerk, Church Street, West Hartlepool, not later than noon on Monday, July 21.

The Corporation do not bind themselves to accept the lowest or any tender.

Chas. Burgess,
General Manager.

Tramway Depôt,
Greenland, West Hartlepool,
July 3, 1913.

## SPLIT-SHIFT ABOLITION SCHEME.

While it is correct that the general manager of the Hull Corporation tramways has drawn up a plan, outlined in our last issue, for abolishing in that city split turns of duty, a published summary of Mr. McCombe's report which reached us led to a misunderstanding regarding his view of the men's suggestion that the hours of labour be reduced from 54 to 51 per week. Mr. McCombe did not recommend so sweeping a concession as that would prove to be from the aspect of its financial effect on the undertaking and the position in which the employees stand when compared to those of many other tramways. Indeed the Hull men are in danger of being surfeited. Their conditions are already exceptionally favourable, but they are even yet unsatisfied and, prior to this concession, proposed to keep up an unceasing agitation. The request for a 51-hour week is in pursuance of this policy, and because the Committee offered them 53½ hours instead of 54, and an interval of two hours for tea, they not only objected to the proposal but indulged in talk concerning "strong measures." Nearly five months have elapsed since that midnight assembly, and the grumblers have no doubt come to the conclusion that they are too well off to risk the loss of their situations, for there are many applicants for vacancies. Only last year they received concessions involving an outlay of £1,250 per annum, and the Committee are thoroughly justified in refusing to incur the further expenditure of £2,000 required to give a 51-hour week. Apparently Glasgow is the only place where those hours prevail, but the Hull men's labours are certainly not so exacting as is the case in the Scottish city, and according to the deputy chairman of the Hull Tramways Committee the minimum and maximum wages are higher in Hull. Moreover, there are over fifty municipalities where the employees work from 54 to 65 hours a week. As recently as December last Alderman Jackson, of Salford, general secretary of the union, wrote:—"I should only be too delighted if we could establish a general 54-hours' week, as you have, throughout the whole country for the time being; but with so many towns working 60 hours, it would be almost impossible to make out a case for an eight-hour day that would carry the support of the Council and the public of Hull." The present proposal for the abolition of the split shift offered to the men is a great step in advance of the men's proposals, and Mr. McCombe deserves credit for the ingenuity with which he seeks to achieve the desirable purpose of giving a shorter spread over of time, thus allowing them more leisure. It is satisfactory to learn that they have thanked the Committee for the consideration given to their case, and have expressed high appreciation of the manager's scheme. Under its operation they will as far as possible be given an early week and a late week alternately. Whether the plan of combining the duties of motorman and car washer and conductor and car washer works successfully will depend upon how new applicants for employment regard the joint task at a higher rate of pay. The thanks now expressed by the old hands would be regarded as being more sincere if these men had offered to take service under the new conditions.

## RAILLESS TRACTION AND ROAD MAINTENANCE.

The question whether the promoters of railless traction schemes should be called upon to contribute to the cost of maintaining the roads over which the trackless cars run has been debated on several Bills before Select Committees during this session of Parliament. Various agreements by no means uniform in character have been reached. In some cases promoters are to pay three-eighths of a penny per mile run, and in others any special wear caused by the cars is to be assessed by arbitration. The most recent case to be settled, however, raised the point in a specially direct form, and no agreement was reached beween the promoters and the road authorities. The Western Valleys (Monmouth) Railless Traction Bill was the measure in question, and a Committee of the House of Commons decided that the company promoting the Bill should pay three-eighths of a penny per mile run, but this is not to apply to workmen's cars, on which specially low fares are charged. By giving this direct decision the Committee have carried the practice of Parliament a step further, because previous Committees, recognising the necessity for general legislation on the subject, had succeeded in getting the parties to come to agreements and thus the Committees avoided giving direct decisions. The effect of the finding in the Western Valleys case on the proposed undertaking is hard to forecast. There will be some eight miles of route connecting various towns and villages with a total population of about 60,000. The company are going to provide their own generating station, and this explains the fact that the capital expenditure on the whole undertaking is estimated at some £70,000. It has been proposed that there should be a 7½-minute service for 16 hours a day. That would mean a very considerable mileage run per annum, and a correspondingly large payment to the road authorities. As the whole question is only in the early experimental stage, it is possible for a wide variety of opinions to be held on the subject. In that connection it may be noted that the promoters offered to pay one-farthing per mile run, while some of the local authorities wanted five-eighths of a penny.

Digitized by Google

What is certain, in a matter of so much uncertainty, is that the contribution payable by the company, if fixed at all, should have been fixed for only a limited period—say two or three years—and that then the matter should be open for a fresh settlement in the light of experience. Even when experience has been got in one place, that will not be a guide for others, because roads in some localities are much more solidly constructed or laid with better materials than in others. That will affect the question of how much wear is caused by trackless cars. Beyond all this, there is the question of the automobile omnibus which may be run by companies anywhere free from any contribution to road maintenance. It is perfectly clear that Parliament cannot go on placing burdens on the trackless trolley system and leaving the omnibus to go free. The whole subject merits careful and general consideration, first by experts and then by Parliament.

## THE COMMERCIAL MOTOR VEHICLE EXHIBITION.

In connection with the above, which opens at Olympia on July 18, a dinner was given at the Grand Hotel, Charing Cross, on Thursday last by the Society of Motor Manufacturers and Traders, with Mr. S. F. Edge, the president of the Society, in the chair. A company of over 100 guests assembled, and these included among others Lieut.-Colonel A. F. Mulliner, E. M. C. Inston (Daimler Company), vice-president, F. W. Shorland (Clement Talbot), S. Straker (Sidney Straker and Squire, Limited), chairman of Commercial Vehicle Committee, Raymond Dennis (Dennis Bros., Limited), R. Barry Cole (Commercial Cars, Limited), F. Churchill (J. and E. Hall, Limited), W. Dewiss (Milnes-Daimler), J. Maughfling (Thornycroft and Co., Limited), A. Spurrier (Leyland Motors, Limited), Chas. Jarrott (Jarrott and Letts, Limited), A. S. Mays-Smith (Delaunay Belleville, Limited), P. Liversidge (Liversidge Bros., Limited), H. Smith (Rover Company, Limited), J. D. Siddeley (Deasy Motor Car Company, Limited), D. Citroen (Minerva Motors, Limited), A. Brown (Brown Bros.), H. A. Blackie (Exhibition manager), C. D. Clayton (Press manager), and T. F. Woodfine (secretary of the S.M.M. and T.).

In proposing the toast, "The Exhibition," Mr. Shrapnell Smith referred to the great progress mechanical road traction had made during the past five years, and said he felt confident that the display that would be made at Olympia in two weeks' time, coupled with the fact that the railway companies had raised their transport rates some 4 per cent., would result in a very large increase in the number of motor vehicle users in all parts of the country.

Responding to this toast, Mr. Straker said that everything possible had been done to make the forthcoming show a success, and they had every reason to hope that it would prove to be the finest exhibition of industrial motor vehicles that had ever been held. In response to the society's invitations, municipal authorities from all parts of the world had arranged to visit the exhibition.

The Chairman proposed the toast of "Our Guests," and reminded the company that the use of motor vehicles not only economically replaced horses, but meant increased trade. In London alone £35,000,000 was paid annually for haulage, and although a considerable portion of this was now earned by horses, in the comparatively near future there could be no question but that the bulk of it would pass to the motor vehicle.

## TROLLEY WIRE COPYRIGHT ACTION.

At the Lancashire Chancery Court, Liverpool, on June 24-26, the British Insulated and Helsby Cables, Limited, claimed damages against the London Electric Wire Company and Smiths, Limited, of Anaconda Works, Salford, for an alleged infringement of their registered designs for overhead trolley wire for electric tramways, and they asked for an injunction to restrain the defendants from further infringements of their copyright.

Evidence was called for the plaintiffs to the effect that the defendants sold, or offered for sale, trolley wire to the Corporations of Halifax and Wallasey which had been made in accordance with, or was an alleged obvious or fraudulent imitation of, the plaintiffs' designs.

One of the representatives of the plaintiff company stated that 35 corporations in this country had been supplied with plaintiffs' wires, and that they had also supplied South Africa and Australia in large quantities.

Mr. W. M. Mordey, electrical engineer, Westminster, said in his opinion the wires supplied by the defendant company were an infringement on the plaintiffs' designs. The wires of the plaintiff company surmounted in the fullest degree the difficulties previously experienced in relation to the attachment of the trolley wires to their overhead support.

Witnesses were called for the defendants, who contended that the designs which the plaintiffs claim as their copyright were anticipated, and that they were neither novel nor original. Judgment was reserved.

## BIRMINGHAM AND THROUGH ROUTES.

Consideration was given on July 1 by Birmingham Corporation to the Tramways Committee's scheme for the linking up of the various tramway routes by means of lines through the central area of the city. The scheme was divided into thirteen sections. Two parts met with the disapproval of the majority of the members, the proposal to link up Broad Street with Colmore Row *viâ* Victoria Square being referred back to the Tramways Committee to prepare a scheme that will avoid Victoria Square, and the suggestion to connect Navigation Street with Corporation Street *viâ* Stephenson Street being rejected by a large majority. All the other proposals, including that for a double line of tramways along Broad Street, were approved. Councillor Harrison Barrow, chairman of the committee, emphasised the dislike the public had to being taken round back-street routes. A minute or two, he said, made a great deal of difference to people travelling on the cars, and as they had found in the case of the Ladywood terminus, often turned profit into loss. Councillors Neville Chamberlain and Cowbridge, the chief opponents, urged that the tramways could only go on making money whilst they had a monopoly of the routes. Their only security was whether the Watch Committee would or would not give competitors powers to run along the streets. Councillor Harrison Barrow declined to enter into a discussion on the merits of motor 'buses and tramways, but pointed out that the returns of the London General Omnibus Company for the six months ended December 31 showed that their expenses ratio had gone up from 81 per cent. to 92 per cent., so that the motor omnibuses were not having it all their own way in London.

## L.C.C. TRAMWAY MATTERS.

SPECIAL CARS FOR SPECIAL PURPOSES.

At last Tuesday's meeting of the London County Council the Highways Committee in their report referred to the subject of by-laws made by the Board of Trade early last year relating to the use of special cars for special purposes. These by-laws contained no provision for the imposition of a penalty for their contravention, and powers to enable this to be done were accordingly obtained in the Council's Tramways Act, 1912. The by-laws had been amended to provide for the imposition of a penalty, and the Committee now presented them in the form in which they understood that the Board of Trade would be prepared to make them. The Committee accordingly recommended that the Board of Trade be asked to make by-laws providing among other things that no male person shall, unless duly authorised by the Council, mount any tramcar which is run and reserved for female persons only; that in any case in which the car is reserved for any special purpose, which shall be indicated by a conspicuous notice, no person other than a person for whose convenience such tramcar is reserved shall mount such tramcar; and that any person offending against these by-laws shall be liable to a penalty not exceeding 40s.

TENDERS FOR CABLES.

The Committee had considered the following tenders for the supply of high and low tension electric cables required in connection with the construction of further portions of the tramways, and also for maintenance purposes during the current year :—

| | £ s. d. |
|---|---|
| Western Electric Co. ... ... ... ... ... | 25,409 16 8 |
| Johnson and Phillips ... ... ... ... ... | 26,018 3 5 |
| Siemens Bros. and Co. ... ... ... ... | 26,169 0 11 |
| W. T. Henley's Telegraph Works Co. ... ... | 26,187 10 3 |
| Callender's Cable and Construction Co. ... | 26,941 18 2 |
| W. T. Glover and Co. ... ... ... ... | 27,201 5 4 |
| British Insulated and Helsby Cables ... ... | 27,837 11 9 |

The estimate of the chief officer was £24,000. That estimate was prepared from the details contained in recent tenders, but it appeared that the market price of cables had risen somewhat since. In all the circumstances the Committee were of opinion that the tender of the Western Electric Company was a favourable one, and they recommended its acceptance.

CONDITIONS OF EMPLOYMENT.

The Rolling Stock Sectional Conciliation Board had considered an application by armature winders that their pay should be increased from 9½d. to 10½d. an hour, and had agreed to a settlement on the basis of 10d. an hour. The Committee recommended that this agreement should be accepted. The cost would amount to about £101 10s. for the remainder of the current financial year, and to £185 during the year 1914-15.

Under the terms of an agreement arrived at on May 31, 1911, by the Central Conciliation Board, and approved by the Council on July 4 following, shunters and traversemen were allowed a uniform consisting of a jacket and cap annually. The employees' representatives at a meeting of the Sectional Board on June 5 proposed that these men should be supplied with additional uniform. The Committee had now arranged for them to be furnished with an overcoat once in every two years. The number of men affected was 52, and the cost would amount to about £60 every two years.

ARRANGEMENTS FOR THROUGH RUNNING.

The Committee were advised that owing to the large number of cars now being fitted with trolleys and plough collector gear for through running and other purposes, it would be necessary to obtain 1,000 ordinary leads and 3,500 sliding contact leads. It was proposed that tenders should be invited from selected firms.

The various proposals were adopted.

## MISCELLANEOUS NEWS AND NOTES.

**Cost of the Brighton Railless Traction Bill.**—The sum of £3,000 was expended in obtaining the Brighton Corporation Act which gives powers to operate railless trolley cars and motor omnibuses.

**Extension of Halfpenny Fares at Leeds.**—On the recommendation of the Tramways Committee the Corporation on July 2 agreed to the introduction of halfpenny fares on routes where they are not at present in force.

**L.C.C. Tramways and Traffic Inducement.**—On the occasion of the London Fire Brigade review at Peckham Rye, the County Council's tramway department issued 20,000 special circulars calling attention to the tramway facilities.

**Success of P.A.Y.E. Cars.**—Aberdeen tramway traffic returns for the week ended June 25 show an increase in the revenue on the new P.A.Y.E. cars on the Woodside route of £11 10s. 2½d., and for the past eight weeks since the introduction of the new vehicles £226 10s. 1d.

**Tramways Exhibit for Lyons Exhibition.**—Glasgow Tramways Committee have instructed the general manager to arrange for a model of a car and diagrams describing the work of the department being prepared for the International Exhibition to be held at Lyons next year.

**Running Powers for a Company in Sunderland.**—Provided they have power to do so the Tramways Committee have agreed to grant the request of the Sunderland District Tramways Company for running powers over the Corporation's line from Grangetown to the centre of the town.

**Two Women Saved by a Lifeguard.**—Three women who were walking arm-in-arm stepped off an island footpath on Blackpool Promenade on June 30th in front of a tramcar. They were knocked down, but two were picked up by the lifeguard of the car. All three were taken to the hospital.

**Biograph Illustrations of Street Car Accidents.**—The Chicago Railways Co. have obtained a reel of 1,000ft. of film showing 40 scenes of different types of street car accidents. This film will be exhibited before the employees of the company, also before school children and the public generally, at schools and on street screens.

**Self-Propelled Cars for an Edinburgh Line.**—While declining the terms offered by the Colinton Tramways Company for the sale of their tramway to the city, the Edinburgh Corporation have directed the Tramways Committee to report upon any other offer that may be made by the company or the War Office. The latter desire the line to be extended to Redford Barracks, and the company had agreed to run self-propelled cars from Tollcross to Colinton.

**Light Railways Order.**—The Board of Trade have confirmed the under-mentioned Order made by the Light Railway Commissioners:—Glamorgan County Council (Morriston to Pontardawe) Light Railways (Revival as to part) Order, 1913, reviving the powers granted by the Glamorgan County Council (Morriston to Pontardawe) Light Railways Order, 1903, in relation to part of the railway and works thereby authorised, and for other purposes.

**Tramways to be Let on Lease.**—It is reported that the Barking Urban Council Tramways produced a loss of £7,200 for the year ended March 31st, following a loss of £5,000 for the preceding year. The chairman of the Council attributes the loss to the competition of the motor-omnibuses, competition with the municipal tramways in West Ham, East Ham, and Ilford, and the absence of inter-running with Ilford owing to the high terms demanded by Ilford Council. "Our only hope," he says, "is to let the tramways on lease to someone." For the electricity undertaking he states there is some hope.

**The Difficulty at Oxford.**—As the result of an interview with Mr. Cownie, of the National Electric Construction Company, the Tramways Committee have decided to recommend the acceptance of a scheme for running petrol-electric tramcars in High Street, Cornmarket Street and Queen Street, overhead trolley tramcars in the outskirts of the city, and motor-omnibuses on the routes now served by horse 'buses, with the exception of the Iffley Road route, on which it is proposed to have the overhead system. The scheme also includes the substitution of motor-omnibuses for tramways down St. Aldates.

**Effect of Turbine Machinery at Rotherham.**—Mr. E. Cross, the electrical engineer, in his report for the year ended March 31, draws attention to the reduction in the cost of operation, as against any figure that had hitherto obtained, particularly when the high cost of fuel and the increased cost of materials generally are taken into consideration. The cost of generation, .541d. per unit, he considers as distinctly good when compared with the results obtained by towns of a similar character to Rotherham. The reduction in costs is due to the increasing power load, and the adoption of turbine machinery instead of continuing with reciprocating plant.

**Croydon Corporation and Motor-Omnibuses.**—At a meeting of the Croydon Council held on June 30th, on the recommendation of the Tramways Committee the following resolution was unanimously adopted: "With reference to the motor-omnibus traffic in the borough, the Committee recommend that the Government be urged to pass such legislation as will place the motor-omnibus companies on terms of equality with regard to public obligations with the municipal tramways authorities in the Metropolitan area, and that a communication be addressed to he Prime Minister, the President of the Board of Trade, and the Member for the borough, upon the subject."

**Economy Effected by Modern Plant.**—In a report presented to the Tramways Committee, the manager of the Reading tramways says:—"The automatic reversible booster and battery were put into operation on April 25, and have worked daily and a distinct saving in coal has resulted. With the reduced number of engines running per day, and the shorter period of running, two engine drivers are able to do the work for which three men were previously needed, resulting in a saving of £83 4s. per annum. The first chain grate stoker was put to work on May 21, and the boiler equipped with it is generating the total steam required in the power station, and so far the smokeless working guaranteed by the contractors has been attained."

**Interference with a Manager Deprecated.**—Several members of Belfast Corporation on June 30 raised questions concerning the tramway service on several routes, and an amendment instructing the Committee to provide for six months a reasonable service on the Glengormley section was lost by 19 votes to 18. Mr. Nance, the general manager, had stated that there had been a former service on this route, and that the proposal would mean a loss of 7d. per car mile. In regard to another route, Alderman Doran deprecated interference with the management which on a previous occasion had almost ruined the undertaking. They should let the manager alone. Alderman Sir Robert Anderson said that the manager had informed him that he would look into the matter.

**Bristol Tramways Company's New Motor Works.**—On July 1 and 2 large parties of shareholders inspected the new Brislington motor works. Sir George White, Bart. (chairman), Mr. Samuel White (managing director), Mr. Hugh G. Doggett and Mr. G. Stanley White (directors), Mr. H. F. Cooper (secretary), Mr. C. Challenger (manager), Mr. S. E. Smith (assistant manager), and Mr. G. T. Edwards (engineer) were present to receive the guests, who were shown over the extensive works, which cover an area of 4½ acres. The visitors, on leaving, expressed great satisfaction at the development of the latest department of the company's business, and were pleased with the manner in which the building operations had been carried out, under the supervision of the company's engineer (Mr. G. T. C. Edwards), and the planning of the various shops by Mr. Scrise, consulting engineer.

**Visit to Hadfield's Steel Foundry.**—In connection with the International Road Congress, a large party paid a visit on June 30th to Hadfield's Steel Works at Sheffield, and were received by Sir Robert Hadfield, Mr. A. M. Jack, J.P., the managing director, and other members of the board. The production at the works has grown to such an extent during the past few years that the total workshop area now covers some 25 acres, the total area of the works being about 100 acres, round which some 25 miles of rail track is laid. The employees number some 6,000. Various stone-crushing machines were inspected, and the track-work department proved of considerable interest. It embraces both simple and complicated junctions, crossovers and layouts for railway and tramway work. Several acres of flooring are reserved for putting component sections together, and to ensure exact assembling on the site. Other departments inspected were those devoted to the machine shop, foundry, wagon, laboratories, and armour-piercing projectiles.

## PERSONAL.

**Mr. I. Bulfin,** general manager of Bournemouth Corporation tramways, has been granted an advance in his salary to £700.

**Mr. H. H. Couzens,** late of Hampstead electricity works, took over the charge of the new hydro-electric installation at Toronto on July 1.

**Mr. W. M. Nelson** has resigned his appointment as engineer to the Christchurch (N.Z.) tramways, and rejoined the Brisbane Tramways Company.

**Lieut.-Colonel F. G. Von Donop,** R.E., has been appointed Chief Inspecting Officer of Railways, in succession to Colonel Sir Arthur Yorke, R.E., C.B., who has retired under the age limit.

**Captain T. C. FitzHugh,** M.V.O., the Chief Commissioner in the Far East, recently appointed by the British Engineers' Association, has left London for Peking accompanied by his technical secretary, Mr. L. B. Stevens.

**Mr. A. Murdock,** electrical and tramways engineer to the Melbourne City tramways, has returned to England on leave and is staying at Blackpool, where he was formerly on the staff of the Corporation electricity works.

**Mr. W. Wyld** has been presented with a silver salver from the chief officers of Birkenhead Corporation on resigning his appointment as tramways manager and electrical engineer to become electrical engineer to Hampstead Council.

**A Southampton Vacancy.**—The Corporation have decided to appoint a general manager to take the entire control of the tramways undertaking, at an initial salary of £400 per annum, in order to enable Mr. H. F. Street to devote his whole attention to the electricity department.

**Mr. P. H. Marco,** general manager, Barnsley and District Tramways Company, presided at the annual dinner given by the company to the employees. Alderman Rose, who proposed the toast of the Tramway Company, said it was to the untiring efforts of Mr. Marco that the present position of the company was due. He had grappled with a very difficult period and brought about great improvements. Mr Marco, in response, expressed the regret of his chairman (Mr. E. Garcke), and directors (Colonel Sir Thos. Pilkington, Bart., and Mr. E. A. Paris) at their inability to attend. Although nearly twenty million passengers had been carried, and about two million miles had been run, they had not had a fatal accident, and he gave the staff the whole of the credit for doing their work so thoroughly and so well. He fully appreciated the fine work of his departmental officers—viz., Mr. A. Wood, traffic superintendent; Mr. A. Kenworthy, department superintendent; Mr. J. Cocking, chief clerk; and Mr. McFayden, permanent way superintendent. Mr. Marco also expressed his gratification at the

Digitized by Google

employees having won the Lansdowne "Devonshire Challenge Cup" for the best health record amongst the thirty or forty associated companies of the Federation, three times in four years.

**West Ham Tramways Managership.**—The appointment of manager of the Corporation tramways will be made on Tuesday next, when Messrs. A. Coveney (Erith), J. S. Moffet (Rochdale), and R. S. Pilcher (Aberdeen) will be interviewed. These selections were made by the Tramways Committee out of eight candidates who attended their meeting on July 1.

**Mr. Butler** has been appointed engineer of tracks and tramways to the Government of Tasmania. At an inquiry held at Launceston on May 21 by the Minister of Lands and Works into applications for tramway improvements, the Minister said there had been some difficulty with the Public Service Board in creating the new office. The department's trouble was that they had more work than they had engineers for. It would take the engineer some time to organise his department.

---

**Mr. J. Armitage,** an inspector of the Huddersfield tramways, died on June 26 from injuries received by being knocked down by a motor wagon while on duty. At the funeral on June 28, Mr. R. H. Wilkinson, the tramways manager, and a large number of the employees attended.

## CONTRACTS AND ORDERS.

**Dick, Kerr and Co.** have obtained a contract for permanent way renewals in connection with Belfast Corporation tramways.

**Bolton Council** have accepted the tender of Newton, Chambers and Co., Limited, for feed tanks, and that of Musgrave and Co., conditionally, for condensing plant.

**Wm. Airey and Son** have been awarded the contract for the erection of a tramways depôt, workshop offices, and a club for employees in Sovereign Street by Leeds Corporation.

**British Thomson-Houston Company** have been awarded the contract for the supply of two 300 kw. rotary converters, with transformer switchgear, traction feeder, etc., to West Hartlepool electricity works.

**The Peckham Truck Company,** of Queen Anne's Chambers, Westminster, have recently received orders for two of their long wheel base radial trucks from the Liverpool Corporation tramways, for use with the Mellins improved double-decked cars.

**London County Council** have accepted the following tenders:—Western Electric Company, high and low tension electric cables, £25,409 16s. 8d.; Hadfield's Steel Foundry Company, steel and iron castings for permanent way during the year ending April 30, 1914, £144.

**Stalybridge Joint Tramways Board** have accepted the following tenders in connection with the extensions to the generating station:—Economisers, Goodbrand and Co.; supply and erection of steel work for boiler house, Ed. Wood and Co.; feed water heater, Messrs Babcock and Wilcox; weigh bridge, Ellis and Son.

**Salford Council** have accepted the following tenders:—Brush Electrical Engineering Company, Limited, one double-deck, single-truck car body, with vestibule ends, £530, nine additional car bodies of a similar character at the price of £500 per car body, subject to a reduction of £30 per car body if after the experimental period has elapsed it is decided to have the nine car bodies without the vestibule ends; J. G. Brill and Co., ten tramcar trucks, less wheels and axles, £548; Walter Scott, Limited, 1,000 tons of Sandberg steel tramway rails, at £7 7s. 6d. per ton.

## FINANCIAL REPORTS AND MEETINGS.

**Provincial Tramways Company.**—The board have declared an interim dividend of 8d. per share on the ordinary shares for the past half-year.

**Mexico Tramways.**—The directors have declared a dividend of 1¾ per cent. on the issued capital stock of the company, payable August 1 to shareholders of record July 12.

**Dublin United Tramways Dividend.**—Ad interim dividends at the rate of 6 per cent. per annum, less income tax, on the preference shares, and at the rate of 6 per cent. per annum, less income tax, on the ordinary shares for the half-year to June 30th have been declared.

**The British Electric Traction Company.**—The receipts of all the associated companies of the British Electric Traction Company for the week ended June 27 amounted to £39,289. Upon such of the lines as were working both last year and this year the receipts show an increase of £2,729 upon the week.

**General Electric Company's Dividends.**—The directors recommend the following appropriations out of the balance of £124,890 for the year ended March 31st:—Managing director's and employees' bonus, £9,284; expenses of new issue of preference shares, £10,275; dividend on ordinary shares at the rate of 10 per cent. for year, £40,000; reserve account, £30,000; condtional appropriation to staff benevolence, £3,000, carrying forward £32,331.

**The Railless Trolley Service at Bradford.**—The railless trolley car installation on the outskirts of Bradford produced an income for the year ended March 31 of £1,233, representing 7d. per car mile; while the expenditure (£1,613) represented 9d. per car mile. There was therefore a deficit of £380, or of 2d. per car mile run. It is pointed out, however, by the City Treasurer that the railless section is a feeder of the general tramways system and contributes to some extent to its profits.

**Power Station Improvements for Norwich.**—Baron d'Erlanger, presiding at the annual meeting of the New General Traction Company, stated that owing to the increased cost of fuel, the directors had decided to take advantage of the improvements in the generation of electric power which had been developed since the erection of the power station of the Norwich tramways in 1899, and they therefore proposed to instal a steam turbine and a generator of 500 kw. capacity. They also proposed fitting the boilers with superheaters and mechanical stokers. It was anticipated that these changes would save approximately £2,000 a year in working expenses. During the year they had paid off the whole of the prior lien debentures of the floating debt owed by the New General Traction Company, and had reduced the five per cent. mortgage debentures to £158,300. The profits of the company were now derived from the American Company, the Douglas tramways, and the Norwich tramways. A dividend of 4 per cent. was ordered to be paid.

**Stalybridge Joint Tramways Loss: Heavy Motors and Track Repair.**—It was reported at a meeting of the Stalybridge, Hyde, Mossley, and Dukinfield Joint Tramways and Electricity Board on June 26 that the loss on the year's working was £9,124, or £2,000 more than in the preceding year. Alderman Wood (Stalybridge), in moving the Tramways Committee minutes, said they had not much to congratulate themselves about in the way of revenue, but of course, they knew that they had been stopped for a short time, when they did not even earn interest and sinking fund. In 1905 they earned 6.67d. per car mile; the following year 6.04d. per mile, and last year 7.88d. On track and overhead equipment they spent £2,000. He did not necessarily mean the rails, but the pavement also, and at the Municipal Tramways Association meeting a resolution was passed asking Parliament to do something in the way of asking the owners of commercial motors who carted heavy loads to pay something for the upkeep of the roads. If three-eighths of a penny per mile could be collected from the owners of these vehicles it would go a long way towards maintaining the roads. Councillor Fowden observed that notwithstanding that the tramways were losing heavily the electricity department had seen fit to increase the price of current to the tramways. This increase amounted to about £1,300 per year. It was decided to issue precepts on the four authorities for the amount of the deficiency.

**The Imperial Tramways Company.**—The directors report that the scheme of arrangement which was approved by both classes of shareholders, has received the sanction of the High Court. Accordingly the arrears of dividend on the preference shares to December 31, 1911, have been cancelled, and ordinary shareholders have relinquished their exclusive rights in the ordinary shares dividend fund, which will in future form part of the dividends equalisation fund applicable to maintenance of dividends on both preference and ordinary capital. The investment in the London United Company has been written down, and the sum of £85,000 has been transferred from the reserve fund for renewals and contingencies for that purpose, leaving the present amount of the reserve funds at £65,122. The directors state that in their opinion the shareholders may now look for the regular payment of preference dividend and the maintenance of at least 4 per cent. on ordinary share capital. The revenue account shows an available amount of £24,255, and after payment of interest on debenture stock for the whole year there is a balance, including £7,678 brought forward, of £10,221, which the directors recommend should be appropriated as follows:—Dividend at 6 per cent. for the year on preference capital (less income-tax), £11,300; dividend at 4 per cent. for the year on ordinary capital (less income-tax), £7,533; and to carry forward £388. A portion of the investment in the London United Tramways, Limited, has been disposed of, 20,000 shares out of the 44,446 £10 preference shares having been sold. The permanent way of the Middlesbrough, Stockton, and Thornaby tramways has been further renewed, so that two-thirds of the track has been re-laid. The re-construction of the remainder will probably be completed this summer.

**Bradford Corporation Tramways.**—The extension of the period during which halfpenny fare facilities are given is stated to be mainly responsible for the reduction in the net profit on the tramway undertaking in the City Treasurer's balance-sheet for the year ended March 31. The net profits amounted to £41,921, as compared with £52,782 for the preceding year. The traffic income (£270,524) showed an increase of £6,044, but as there had been an increase in the mileage run amounting to 271,000 car miles the income per car mile worked out at a lower figure than in the previous year—11.3d. as compared with 11.6d. Wages of drivers and conductors accounted for an increase of £4,456, of which £2,000 was in respect of advances of wages and £2,500 in respect of increased staff consequent on the additional mileage. £12,800 was paid in rates—£1,300 more. Repairs and maintenance cost £42,900, an increase of £7,000. Permanent way repairs went up by £3,550, and car repairs by £2,900. Electric power cost £46,000, the larger mileage run being responsible for an increase of £2,000. Per car mile the cost of power worked out at 1¾d. From the parcels department there was an income of £9,500, an increase on the year of £1,200. The expenditure of the department was larger by £1,100, and the profit (£1,067) showed an improvement on the year of £136. As a whole the undertaking made a gross profit of £98,617. From this there had been paid as interest on loans £24,770, and £31,926 had been set aside for sinking fund purposes; leaving a net profit of £41,921, which had been carried to the reserve and renewal account. This account had to its credit at the beginning of the year £75,120, and after payment of £9,000 in relief of rates and £10,000 for renewal of permanent way the account at the end of the year stood at £89,000. From this sum the Council had voted in relief of rates a sum of £17,200. Of the total capital expenditure of £1,002,566 there had been paid off through sinking fund a sum of £378,000.

## WEEKLY TRAFFIC RETURNS.

The official traffic returns of 67 of the principal undertakings of the United Kingdom for the week ended June 28 amounted to £247,325, or £10,543 more than in the corresponding week last year, while the track mileage was 2,712, or 52 more than for the corresponding week. The receipts were at the rate of £91 3s. 11d. per track mile, an increase of £2 3s. 7d. per mile as compared with last year.

(*Continued from page 2.*)

### TOWNSHIP OF SOUTH MANCHESTER.

TO ENGINE BUILDERS.

The Guardians of the Poor of the Township of South Manchester are prepared to receive tenders from engine builders for one 9-11 Kilowatt Steam Dynamo, erected complete at the Sanatorium, "Plas Uchaf," Abergele, North Wales.

Specifications and particulars may be obtained at the offices of Mr. F. W. Page, A.M.Inst.C.E., Consulting Engineer, Clarendon Chambers, 14, St. Ann's Square, Manchester, after the 5th inst., upon payment of £2 2s., which sum will be returned on receipt of a *bonâ-fide* tender.

Sealed tenders, endorsed "Tender for Steam Dynamo," must be delivered to the undersigned at the Guardians' Offices, All Saints, Manchester, not later than Saturday, July 12, 1913.

The Guardians do not bind themselves to accept the lowest or any tender.

By order, DAVID S. BLOOMFIELD,
Clerk to the Guardians.

Guardians' Offices,
All Saints, Manchester,
July 1, 1913.

### FOR SALE.

A number of Trolley Standards, D.K. latest enclosed spring type.

H. ENGLAND, General Manager,
Yorkshire (West Riding) Electric Tramways Co., Ltd.,
Belle Isle. Wakefield.

### POSITIONS VACANT.

### COUNTY BOROUGH OF SOUTHAMPTON.

TRAMWAYS MANAGER.

The Corporation invite applications for the position of Tramways Manager at a commencing salary of £400 per annum.

Applicants must have had previous experience in the management and construction of electric tramways (overhead trolley system) and be capable of taking the entire control of the Corporation Tramways Undertaking, including the maintenance of the electrical equipment and the permanent way and the designing and construction of extensions thereof.

Applications stating age, qualifications, experience, and present and previous occupation, accompanied by copies of not more than three recent testimonials, enclosed in an envelope, endorsed "Tramways Manager," must be sent on or before the 21st July to the Town Clerk.

Canvassing any member of the Council, either directly or indirectly, will disqualify.

R. R. LINTHORNE,
Town Clerk.

Town Clerk's Office,
Municipal Offices, Southampton,
July 1, 1913.

### WALTHAMSTOW URBAN DISTRICT COUNCIL.

APPOINTMENT OF CHIEF INSPECTOR IN TRAMWAYS DEPARTMENT.

Applications are invited for the position of Chief Inspector of the Walthamstow Council Tramways, at a commencing salary of £130 per annum, rising by annual increments of £10, to £160.

Applicants must have had practical experience in the regulation and control of tramway traffic, and must be capable of taking charge of the undertaking in the absence of the manager.

A schedule of the duties attached to the office may be obtained on application to Mr. William Murray, A.I.E.E., Tramways Manager, Chingford Road, Walthamstow.

Applications in the candidate's own handwriting, stating age, and past experience, and accompanied by copies of three recent testimonials should be delivered to the undersigned, endorsed "Chief Inspector," not later than 5 p.m. on Monday, the 14th day of July, 1913.

C. SYDNEY WATSON,
Clerk to the Council.

Town Hall, Walthamstow,
July 2, 1913.

### PLATELAYER.

Wanted, good Platelayer. Must have had tramways experience. Wages 8d. per hour.

Apply to General Manager, Coventry Corporation Tramways, Coventry.

## COPPER AND ALUMINIUM MARKET.

July 4, 1913.

Messrs. Henry R. Merton and Co., Ltd., 2, Metal Exchange Buildings, Leadenhall Avenue, E.C., supply the following quotations of prices per ton :—

THE Tramway & Railway World
WITH MOTOR TRAFFIC SECTION

ESTABLISHED 1892. LONDON, JULY 10, 1913. VOL. XXXIV.

# THE TRAMWAYS AND LIGHT RAILWAYS ASSOCIATION AT BLACKPOOL.

## FIFTH ANNUAL CONGRESS.

The Annual Congress of the Tramways and Light Railways Association grows steadily in interest and importance, and the meeting held at Blackpool last month was again eloquent of the energy and ability with which the work of the Association is carried on. In the members of the Council and the secretary, Mr. A. de Turckheim, the Association have representatives who are closely in touch with the needs of the industry and spare no pains to advance its interests. Members have opportunities to judge of the thoroughness with which the work is conducted from the elaborate arrangements made for the annual congresses. At these gatherings everything seems to be provided for down to the least detail with a degree of care and precision that amounts to positive genius. Not only do the formal proceedings go with a businesslike swing, but the whole of the meeting is characterised by an excellent spirit which adds not a little to the enjoyment of those who attend. Another feature which tends, no doubt, to enhance the interest of the annual gatherings is that they include representatives of all branches of the tramway industry. Both municipal and company tramways are well represented, and year by year the barriers, which in what we may call the bad old days when the two interests regarded one another with covert hostility, have gradually disappeared. We believe that this union of interests is all to the good. It does not detract in any way from the value of the Municipal Tramways Association, which has an assured position of great usefulness, but it provides common ground for the meeting of those who might not often otherwise be brought into contact; and it affords opportunity for the expression of opinion on behalf of the whole industry, which at certain times must be particularly useful. Two matters, for instance, discussed at Blackpool—the question of goods haulage on tramways and the present burden laid on tramways for the upkeep of roads—concern municipal tramways as much as privately-owned lines, and the unanimous expression of opinion elicited upon these two important topics may be considered as registering a material step in a forward programme. In the following pages are given practically in full the papers read at the Congress and the discussions upon them. They deal with subjects of much importance to tramway administrators and owners and will repay perusal.

Overhead Trolley Tramway on "The Front" at Blackpool.

With his customary thoughtfulness the secretary had arranged for special saloons to be attached to the 2 p.m. Scotch express from Euston on Wednesday, June 10, and many members took advantage of the through carriages. On arrival at the Imperial Hydro Hotel, the head-quarters of the Congress, the party were joined by members who had come from other parts of the country, and the evening was devoted to informal reunions and the exploration of that astonishing example of municipal enterprise which is described by enthusiastic residents as "the one and only Blackpool." As a seaside resort it is, indeed, in many respects

Digitized by Google

unrivalled. Our American street railway friends sometimes sing the praises of Atlantic City and its "million-dollar pier" on which they often hold their conventions; but Atlantic City has not the wealth of resources that renders Blackpool peerless as a popular playground. Democracy, too, would look far without finding a more complete exponent of the spirit of collective enterprise. The activities of the municipality are endless, and it devotes the same enthusiasm to the entertainment of the multitudes who throng its promenades and play-houses as it does to the provision of sanitation and tramway transport. In the latter respect the Town Council has for many years been amongst the most progressive authorities in the kingdom. As long ago as 1885 they installed a conduit tramway along the front, but finding it unsuitable for the conditions they replaced it with the trolley system, and from time to time they have extended their lines until they have to-day a total length of track of 21 miles. Private companies on either flank have emulated the example of the Corporation, and the Blackpool and Fleetwood Tramroad Company's cars take passengers northward along the coast to Fleetwood, while the Blackpool, St. Anne's, and Lytham Tramways similarly serve the popular resorts southward, their lines extending for some seven miles through a district diversified by pleasant residences, sylvan retreats, and golden sea-shore.

Fresh arrivals on Thursday morning brought the attendance up to nearly 200, and many members and guests were accompanied by ladies, for whom a special programme had been arranged. About 10 o'clock a large company gathered in the ballroom of the hydro, where they were welcomed with great cordiality by the Mayor of Blackpool and representatives of the local tramway companies referred to above. After the opening ceremony, Mr. Harry England, vice-chairman of the Association, presided in the absence of the Hon. Arthur Stanley, who was unable to reach Blackpool until evening, and the Conference gave its attention for nearly three hours to the discussion of papers by Mr. Edwardes, general manager of the Lancashire United Tramways, on the "Possibilities of Increasing Profits on Interurban Tramways," and by Mr. Fred Bland, of Messrs. Edgar Allen and Company, on "Tramway Track, 1883 to 1913." The former dealt mainly with the question of goods traffic on tramways, and the discussion was notable for the general consensus of opinion expressed that the matter ought to be practically studied through a committee to be specially formed. Mr. Bland's paper reviewed the progress in track construction from the early days of electric traction to the present time. Mr. Bland has been concerned in trackwork in all its phases, and he put forward a strong plea for standardisation. He viewed the matter from the standpoint of both the manufacturer and the user, and we shall be surprised if his treatment of the subject does not lead to an improvement in the direction indicated. The paper afforded a useful illustration of the advantage to be derived from the participation in the work of the Association of the engineer who is engaged on the manufacturing side. When the chairman reluctantly closed the discussion, the members adjourned to luncheon, and in the afternoon in perfect weather were conveyed in special cars provided by the Blackpool, St. Anne's, and Lytham Tramways to Lytham. On the return journey they were entertained by the tramway company to tea at the Imperial Hydro at St. Anne's, after which the cars returned to Blackpool.

In the evening the members and delegates were entertained to a banquet by the Mayor of Blackpool, Councillor M. G. Wilde. An excellent dinner, well served, an attractive musical programme, and speeches of more than usual lightness and verve, combined to make a very successful evening. Of the speeches we attempt no report. They were brief, merry, and admirably suited to the occasion. After the loyal toasts, the Mayor proposed the "Tramways and Light Railways Association," and in reply Mr. Harry England expressed the thanks of the Association for the splendid hospitality of the Corporation, and alluded to the value of such conferences as they were holding. The Hon. Arthur Stanley then gave "The Corporation of Blackpool" in a capital speech, bristling with good points. In response, Alderman Brodie, chairman of the Blackpool Tramways Committee, in his own inimitable way, spread merriment throughout the company. His account of the heroic exploration in times past of himself and of the Blackpool councillors on the Continent in search of the best tramway system for application in Blackpool, was punctuated with applause and laughter. Sir Edward White, chairman of the L.C.C. Highways Committee, proposed "The Mayor of Blackpool," contrasting the happy position of Blackpool as regards tramways with the difficulties with which London was beset.

On the Friday morning the Hon. Arthur Stanley presided, and two papers of much value were presented. Mr. Harry England's monograph on "Railless Traction Legislation" is a digest and analysis of the private Acts passed by Parliament authorising the construction and working of railless undertakings and trolley omnibuses; and it will long remain a source of information to which everyone concerned with such enterprises will turn with gratitude to its author for much painstaking investigation. Not less useful was Mr. England's introduction to his paper, and his strong but fully justified criticism of the unfair competition of motor vehicles, which have provided for them free of cost a permanent way for which tramway undertakings have to pay so dearly, should help to strengthen the determination to bring about a change in the existing conditions. The Hon. Arthur Stanley, in closing the discussion, emphasised the necessity for a central road authority which would devise some fair system of taxation, so that all users of the roads would contribute an equitable share to their maintenance. Undoubtedly a comprehensive and general plan applying to all interests is what is wanted; and as Mr. Stanley said, Mr. England's valuable paper has initiated a discussion that will have far-reaching effects. The concluding item on the programme was a paper by Mr. A. V. Mason on "Rules and Regulations for Tramway Employees." This paper Mr. Mason described as an explanation of the rules and regulations recently published by the Association, and as a member of the committee which had drawn up the rules Mr. Mason was prepared for criticism; but nothing very serious was said against the rules which, of course, are not put forward in any dogmatic way, but as suggestions which may be helpful in securing some degree of uniformity.

On the adjournment of the Congress, the members and guests were taken in special cars of the Blackpool and Fleetwood Tramroad Company to Norbreck Hydro, where luncheon was provided for them as guests of the company. Mr. John Cameron, who has been general manager and secretary of the company since its formation in 1898, was enthusiastically acclaimed by the gathering when he rose to say a few words of welcome. After luncheon the cars were again boarded and the party journeyed to Fleetwood. Here the steamer "Lady Moyra" was in waiting, and the company were taken across Morecambe Bay to Barrow, and then by train to Furness Abbey. Subsequently the company returned to Blackpool and the Fifth Annual Conference of the Association was brought to an end by a members' supper and dance at the Imperial Hydro Hotel.

N. J. Young.

## RECEPTION BY THE MAYOR.

The Mayor of Blackpool, Councillor M. G. Wilde, J.P., and the Mayoress, Mrs. Wilde, were present at the opening of the Conference, and gave the visitors a hearty welcome. They were accompanied by several members of the Tramways Committee and of the Corporation, including the ex-Mayor, Councillor J. Collins, J.P., Alderman J. Brodie, J.P., the chairman of the Tramways and Electricity Committee, Alderman J. Bickerstaffe, J.P., Councillor R. Holt, the vice-chairman of the Tramways and Electricity Committee, Councillors J. R. Gath, T. P. Fletcher, T. Masheter, G. W. Gath, etc.

Mr. H. England, of Wakefield, the vice-chairman of the Executive Council of the Association, presided on Thursday, in the absence of the chairman, the Hon. Arthur Stanley, who was unable to reach Blackpool until the evening.

The MAYOR (Councillor M. G. Wilde) cordially welcomed the Conference to Blackpool. He reminded the delegates that they had come to a town that was progressive in character, that was well ruled in the interests of the ratepayers, and possessed an atmosphere that was good for its visitors. (Hear, hear.) Moreover, they had a Tramway Committee that was doing its best for the town by providing a good service. On the north of Blackpool they had also a most progressive company, the Blackpool and Fleetwood Tramroad Company, which was excellently managed by his friend Mr. John Cameron, who, he believed, was a member of the Council of the Association. On the south of Blackpool they had the Lytham and St. Anne's Tramways Company, whose cars passed through a most delightful district. As in the case of the Fleetwood cars, the Lytham service had done a great deal towards the prosperity of the surrounding districts. The Blackpool and Lytham tramways had undoubtedly been a great public convenience, and he could only regret that the people who had invested their money there were not doing better, though that was no fault of the management. Tramways, he thought, were doing very good work on behalf of the people of the country. They assisted in opening out and developing new districts, and helped the local authorities in making good roads. Blackpool people, he thought, were fortunate in having such a chairman of the Tramways Committee as Alderman Brodie, who was known in tramway circles throughout the country. Alderman Brodie had been the chairman for 17 or 18 years, and as he (the Mayor) had been a member of the committee for 14 years, he was able to say that Alderman Brodie was a model chairman. (Hear, hear.) His colleague, Councillor Holt, was also a very good vice-chairman, while in Mr. Furness they had one of the best tramway managers in the country. (Applause.) Mr. Furness came to Blackpool with the highest recommendations. He promised to do certain things for them, and he (the Mayor) could say publicly that Mr. Furness had more than fulfilled his promises. He had won the esteem and regard, and the trust and confidence of the whole of the Tramways Committee of the Corporation, and to-day was a red-letter day with him, inasmuch as he had brought down his colleagues in similar undertakings from various parts of the country. The Mayor concluded by expressing the hope that the deliberations of the Conference would be a success, and that the delegates would have a very happy time. (Applause.)

Mr. R. B. BARNINGHAM, of Manchester, a director of the Blackpool and Fleetwood Tramroad Company, also welcomed the delegates, and apologised for the absence of Mr. George Richardson, the chairman of the company, who was kept at home by sickness. So far as their company was concerned, he was happy to say that their undertaking had been pretty successful from the start, and its success was likely to grow each year. They had nothing to fear beyond the ocean and the erosion of the coast, and he was hoping that something would be done to guard against any danger there. Their success was largely due not to the board of directors, but to the management. Their manager, Mr. Cameron, had been with them ever since the line was b rn, and he was going to remain with them till he died. (Hear, hear, and laughter.) Nothing would tempt him to leave Blackpool. The directors never needed to take counsel's opinion when anything was going on in the

Digitized by Google

way of litigation. Mr. Cameron was his own counsel, and the line had come to be known as Cameron's line. There had been dreams of a line running through from Fleetwood to Southport, and he thought that might have been brought about long ago by a combination of interests, but with sea and sands, and other things, to contend with, nothing had been done. The Blackpool-Fleetwood tramroad was started about 15 years ago on the American system. The principle in England was to put tramways where there were plenty of buildings, but the system in America was to build a tramway in a promising part and the houses would follow. That had been so in their case along the greater part of the route, and he felt it was rather a pity that they did not own the land on either side of the line. (Laughter, and hear, hear.) If they had been able to see a little bit further into the future, they might have purchased it. (Laughter.)

Mr. C. E. Riding (secretary of the Blackpool, St. Anne's, and Lytham Tramways) added further words of welcome to the members of the Association. He thanked the Mayor for the kind reference to his company, and said he was glad to hear that there was a record number of delegates at the Conference, but then Blackpool itself was always a "draw." He did not think that the directors of the Blackpool and Fleetwood need bother much about coast erosion, because he understood that if the sea got under the land Mr. Cameron was going to run it on stilts. (Laughter.)

The Chairman, in reply, expressed appreciation of the cordial welcome and the kind wishes for the profit, pleasure, and enjoyment of the members while in Blackpool. He regretted that the Hon. Arthur Stanley, M.P., the chairman of the Executive Council, was unable to be with them that morning. Parliamentary and other duties took up much of his time, and at this season of the year it was difficult for such a busy man to be absent from London. Mr. Stanley would, however, probably be with them in time for dinner in the evening. The Tramways and Light Railways Association was formed in the year 1897, and for some time they pursued the even tenor of their way, making no great stir in the world. The Council, dissatisfied with this condition of affairs, resolved to pursue a more progressive policy, and the first and most important move was to secure a chairman with some interest in tramway matters, and general influence. They succeeded beyond their rosiest anticipations, and in the Hon. Arthur Stanley, M.P., they found a chairman who had done wonders for them, and who to-day was held in regard, esteem, and affection by every member of their body. Their next step was to find a tactful and energetic secretary, and they had to thank their chairman again for introducing Mr. de Turckheim, who had proved himself a glutton for work, and splendid in his efforts to make the Association the success it was to-day. This was the fifth Congress they had had since the movement among the dry bones took place, and it promised to be the most successful. They had previously met in London, Dublin, Edinboro', and Swansea, but they anticipated that Blackpool would outshine them all. (Hear, hear.) There might be other opportunities of expressing their opinions upon the charms of Blackpool, and upon the public-spiritedness of its leading citizens, who had created a wonderful town. Speaking as one who had known and appreciated Blackpool from its infancy, he could tell those who were making their acquaintance with the most progressive pleasure resort in the world that the hospitality of the Blackpool people, the warmth and sincerity of their welcome was only equalled by their business capacity, and the courage they had displayed in the building of their city. (Applause.)

The Mayoral party then retired, and the business of the Conference was commenced.

## THE CONFERENCE.

The Chairman expressed his gratification at seeing such a large attendance, because it showed the interest taken in their efforts to benefit tramways generally, and the healthy and vigorous condition of the Association. They owed a deep debt of gratitude to the three tramway friends they had in the district, Mr. Furness, Mr. Cameron, and Mr. Laing, for what they had already done in enabling the council to present such a programme. (Hear, hear.) He regretted that he had one sad duty to perform—he referred to the sudden death of their old, generous, and faithful friend, Mr. J. W. Courtenay. In the early days of the Association, when they were almost overwhelmed with debt, Mr. Courtenay made it possible for them to continue their existence. At that time he provided a room for their council meetings, and, indeed he did more than any other man to keep the Association going. To those who enjoyed Mr. Courtenay's friendship, his death had left a void, and they could not yet realise that another of the old stalwarts had passed away. He moved

> "That the members of the Tramways and Light Railways Association assembled in Congress tender to Mrs. Courtenay and family their sympathy and condolence in their sad bereavement, and desire to place upon record their appreciation of the work Mr. Courtenay has done in times past for this Association."

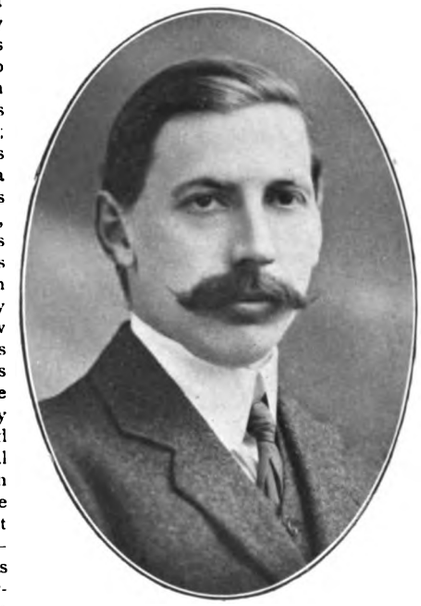
The resolution was passed in silence, all the delegates standing.

The Chairman then called on Mr. Edwardes to read the first paper, which was as follows:

# POSSIBILITIES OF INCREASING PROFITS ON INTERURBAN TRAMWAYS.

By E. H. Edwardes, A.M.I.E.E.
*(General Manager, Lancashire United Tramways Company).*

It is almost impossible in submitting a paper to an Association of this character to strike an original note, and I am not at all sure that such an aim is desirable. Tramways are a work-a-day proposition, and we can only review our experience and practice with an eye to detect here and there every opportunity for development and betterment. I have headed my paper "Interurban Tramways," and in doing so I mean more especially systems that traverse long stretches of country roads, passing through small manufacturing towns and villages, and connecting up with large municipal undertakings. Systems of this character have a wide sphere of usefulness, and it is difficult to imagine how a district so served could dispense with them, though in many cases they have proved a bad investment. Many miles of such tramways were constructed some 10 or 15 years ago with an optimism as to dividends which is now pathetic; but the transit facilities created have become a necessity in the districts through which they run, and it is of such systems that I venture to express my views. They are in such districts the only form of transit, and new schemes and extensions can only be sought in this direction, as our large cities are now mostly equipped. I am inclined to think—and, as general manager of a system such as I have indicated, have perhaps some little right to express my opinion—that one of the mistakes of management of interurban systems is an endeavour to vie with wealthy municipal undertakings. The different conditions are obvious. Mr. McElroy, in a recent report on the Manchester system, is chiefly concerned as to how to cater for his excess of passengers, whereas the problem before us is how profitably to cater for the few.



Mr. E. H. Edwardes.

The two main objects that we have always before us are the possibilities of decreasing our costs and increasing our receipts. Running costs have now become practically standardised, and it is only by the most rigid economy that one manager can show a few points of decimals below another. For the purpose of this paper I will divide these costs under the five following heads:

1. Electrical Energy;
2. Wages;
3. Maintenance of Cars;
4. Maintenance of Track;
5. Maintenance of Electrical Equipment of Lines;

and attached is a schedule taken from twelve typical undertakings showing the proportion these costs bear to the total running costs. I do not propose to deal here with the costs of generation of electricity, as a great many undertakings have to purchase their electrical energy, and are therefore only concerned with the efficiency of motormen, a subject which has been ably dealt with at previous Congresses. Again, there is little to be said with reference to the wages of employees, which are more or less fixed for us; and although they may appear high in comparison with other trades, we have a decided advantage of a higher and more efficient type of man; but I am inclined to the view that the elaborate and expensive uniform is unnecessary, and that in such directions as this, small towns and country districts should not be obsessed by the practice of large cities. Even the London General Omnibus Company have not yet considered it necessary to adopt full uniform, and there is no outcry in the West End. They receive an enormous patronage, and are a profitable concern.

I shall now briefly deal with the three chief maintenance charges, and from the schedule attached it will be seen that the highest of these is maintenance of cars, and, in my opinion, an enormous amount of money is wasted in this direction which is entirely unnecessary. I refer more especially to the upkeep of car bodies. They are gorgeously painted in the most expensive style, covered with transfers both inside and out, lined where possible with gold, and decorated inside with the finest figured wood. In addition, there is a quantity of unnecessary

Digitized by Google

brass hand railing (which is a considerable item in itself to keep clean) and many other superfluities. The initial cost of these luxuries is little considered at the time of the construction of the tramway system, but the yearly burden of maintenance is far more serious, especially to those of us who attempt to keep up this high standard of beauty. It might be necessary in our large cities, but utility is the main thing we have to consider in an interurban system, and an absolutely plain

car, built as much as possible of iron, and painted plainly is all that is requisite. The saving in the initial cost for an efficient car would not be much, but in the upkeep would be considerable.

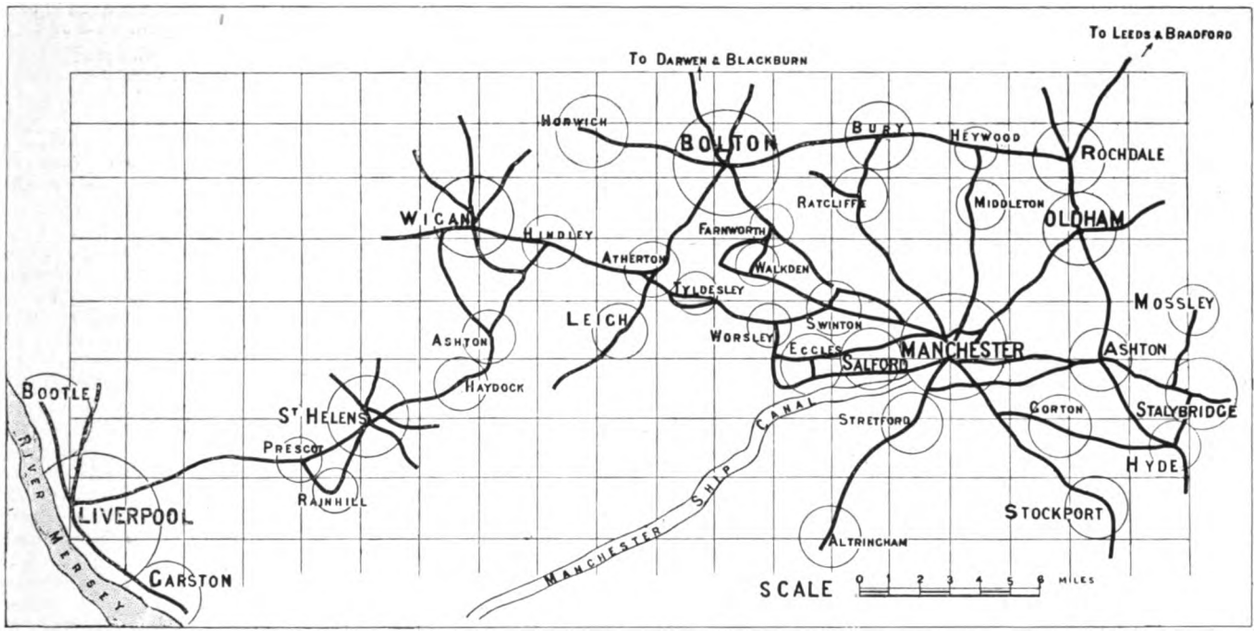
The cost of maintenance of car bodies is somewhere in the neighbourhood of 30 per cent. of the whole car and equipment, and therefore any reduction in this direction is well worth considering. I quite realise that many of you who are responsible for the comfort of travellers in all sorts of delectable spots in the south will be indifferent to my views on this subject, and, of course, there is a vast difference between long miles of tramways in the Black Country, where the majority of travellers are workmen, and popular suburbs in London, or at fashionable sea-side places; but I do advocate a more considered economy, and think a tramcar is an object of utility and can never become a thing of beauty.

With regard to the maintenance of track, I should like to refer to a very interesting paper on "permanent way" read by Mr. Hooghwinkel at the Edinburgh Congress. He suggested that by lightening the cars it would be possible to reduce the cost of track construction. I do not think this is the remedy. The wear of track and paving, especially on interurban lines, is largely due to the ever-increasing motor traffic, which takes advantage of our well-paved tramroads. This is especially noticeable on a road where the car service is not frequent, and where motor lorries can travel a considerable distance before being rung off the track by an approaching car. In many cases it saves time and a possible smash if the cars actually wait in the turn-outs for the motor lorries, giving the lorry the benefit of our road. The number of these vehicles which travel our roads at the present is considerable, and is increasing every year. It therefore appears to me that rather than cheapen our track construction it will be necessary to spend even more money on it than we do at present; and we can only hope that legislation will enforce the owners of motor vehicles to contribute towards the maintenance of our roads, or we must drive them off by healthy competition. This subject I propose to deal with in the second half of my paper.

On the subject of maintenance of track it might be of interest to mention here that one of my companies has recently entered into an agreement with a neighbouring district council, whereby the latter undertake to maintain the whole of the paving of the track for the entire period of the lease of 35 years for a yearly amount based on half the estimated cost of this maintenance, on the understanding that the company carries out certain extensions through their district within 12 months. This is a notable departure from the practice of local authorities in their dealings with tramway companies in the past, and is, I trust, an indication to become general, that those who have supplied facilities for transit that have become a public necessity should not be unfairly handicapped in their enterprise. The council I refer to will now have a tramway, which they are most anxious to get, and they will start with a granite paved road on six inches of concrete against an inferior paved grit road on ashes.

There is very little to be said about the electrical equipment of the lines, as this department is the cheapest and, therefore, the most satisfactory; but even in overhead construction there is room for extravagance. For instance, span work where bracket construction would do; poles with ornamental bases and collars, which are both detrimental to the poles; massive finials, which are often a source of danger; elaborate scroll work on the bracket arms, which is expensive but not good enough to be artistic—I hope I shall not offend some of my manufacturing friends. Such items, although apparently of small importance, all go to increase the maintenance account; and I know of one system where they actually spend annually 15 shillings per pole in picking out the ornamental fittings with gold.

One of the most difficult problems that an interurban manager has to consider, and which more or less affects my preceding remarks, especially wages, is the consideration of the most efficient car service. Much has already been written on the subject, and it has been said that anything less than a 15 minutes' service is unprofitable. This may be true as a general thesis, but what some of us have to consider seriously is whether we lose less with a 20 or even 30 minutes' service than we do with the former. My opinion is that a 10 or 20 minutes' service is often infinitely better than a 7½ or 15 minutes' service, for the simple reason that the former is an easier multiple of time. I have known instances where both 7½ and 15-minute services were changed, respectively, to 10 and 20-minute services, and not only was there a considerable saving effected in wages and maintenance, but there was also a considerable increase in receipts.



**Plan of Interconnecting Electric Tramways Systems of South Lancashire.**

### CARRIAGE OF GOODS.

I venture in the second part of my paper to make some suggestions as to the possibilities of increasing receipts. Taking for granted that the most profitable fares available have been fixed, and the conditions of the line and services meet all the local requirements, the one method of increasing receipts is to extend the scope of the system's usefulness, for instance, by catering for the carriage of goods. I approach this subject with some trepidation. Numerous capable papers have been written about it, and it has also been discussed at some considerable length at our various meetings for the past 15 years; but to the best of my knowledge it has never been given a practical trial, and no regular service of goods haulage has ever been established in connection with any of our tramway systems. It appears to me, however, that this is a most opportune moment—at this Lancashire Congress—to bring the subject up once more before our members, in the hope that a useful discussion will follow, for there is little doubt that if the carriage of goods on tramway systems is possible anywhere it is possible in Lancashire. I have already spoken of the steadily increasing carriage of goods that has taken place yearly by motor lorries, and the detrimental effect such traffic is having on our track. I have taken the opportunity of obtaining particulars of the motor traffic between Bolton and Manchester, and find that on one road alone there passed in one day 150 motor lorries, 50 per cent. of which had trailers, and I believe that this time next year the number will be doubled. Facts such as these force themselves upon our notice, and I feel the consideration of a proposition that we should carry the goods ourselves well worth while. If by the use of our own trucks on our lines we could even pay working costs and interest on capital, the longer life of our permanent way would be a considerable recompense.

From reliable figures I find that the carriage of goods by motor lorry—more especially cotton and cloth—costs about 4½d. per ton per mile, and I gather that many of the motor-carrying companies are not in a very strong financial position; and it appears to me that if the price of petrol continues to increase at the same rate as it has done for the last 12 months, this figure will also have to be increased. Surely a carefully and efficiently organised system of electric wagons with two or three trailers carrying about eight tons each, would enable us to improve on this figure and also to make considerable profit.

The greater proportion of this haulage would have to take place during the night, whereby our electrical installation would be working throughout the whole twenty-four hours, and the load factor at our central stations be considerably improved, which is an item alone to be considered. Attached to this paper is a diagram showing the tramway systems which connect up to one another round Manchester and Liverpool. I have taken this district not because it is the only district with a complete tramways system in England, but because it is as large and as complete as any, and also by reason of this Congress being held in the county of Lancaster this year. The towns shown on this diagram are those which are actually at the present moment connected by tramways, but by connecting up lengths, such as between the two systems of Rochdale and Halifax, or Bolton and Blackburn, a very large increased area could be included, and there is no doubt that an extension of this nature would be made if the carriage of goods came into force. I do not propose to go into the figures with reference to the millions of tons of goods which are carried from the Liverpool and Manchester docks through this area, but it is obvious to all who examine the diagram the extraordinary possibilities presented by the adoption of these lines for the carriage of goods.

There are, of course, other important points to be considered in favour of this method of carrying goods, besides the question of competition with motor lorries. At present, in many of the manufacturing districts of Liverpool, it takes from a week to ten days before the mills and factories can obtain goods from the docks, for the simple reason that owing to the enormous congestion of traffic the railway companies are unable to cope with the ever increasing demand, and we have complaints from shippers of the inability to get their steamers unloaded, and complaints from manufacturers of their inability to get goods. Therefore I feel sure that any proposition put forward would be well received by both shippers and manufacturers. The advantages of this course would be obvious if the goods could be unloaded direct from the steamers on to electrically hauled wagons, and taken direct to the mills or warehouses, but I do not know how far this would be practicable. I have gone into the question very carefully with a great number of manufacturers, and have found that the small amount of tonnage handled in a mill or factory during twelve months would not pay the interest and sinking fund in connection with the erection of a siding for carriage of goods into every mill, but I see no reason why central goods yards should not be established in the manufacturing areas, and the goods transhipped on to motor or horse lorries and delivered by them to the various mills. By the adoption of box trucks and proper lifting tackle, this could easily be accomplished at a very low cost, and the goods which have been brought during the night could be distributed during the day. If such a scheme could be adopted I am of the opinion that a fair return would be obtained on the capital outlay, the tramways would be in operation for the entire 24 hours, and motor traffic would be largely discontinued over the tramway tracks.

I must apologise for presenting so bare and crude an outline of a scheme such as I suggest, but I hope it may invite discussion that may lead on to some practical result. Of course, such a scheme could only be possible by the co-operation of all adjoining tramways.

## THE DISCUSSION.

Mr. E. A. Paris (managing director of the Yorkshire (Woollen District) Electric Traction Company) said that he, as the managing director of an interurban tramway, and all others who occupied similar positions, must thank Mr. Edwardes for bringing the question forward in the way he had done. He would refer to one or two matters regarding running costs mentioned by Mr. Edwardes. The author said that running costs were practically standardised. Well, they were to a certain extent, but when they dissected them according to the five headings given by Mr. Edwardes, there were many discrepancies, although the total sum very nearly approximated. Electrical energy generated by a company or corporation could be produced per car-mile at 1d. to 1½d. cheaper than they had to pay to some four local authorities where their tramways ran. That would mean a very big saving to them if they produced their own electricity. Under the second item, wages, they were in a very awkward position. Those who worked for them wanted more money. Those horrible eye-disturbing things called picture palaces were running away with a lot of the money, and in order to keep things going, the men were asking for more wages. It was the tendency of the age, he supposed, and they would have to submit to it. He was surrounded by Corporations who paid higher wages than they, as a company, were able to do, seeing that they supplied a comparatively sparsely-populated district. Their receipts were 9d. per car-mile, as against 11d. in Halifax and other places, and it was difficult for them to pay the old sum they had been paying previously. They had had to face the problem and the increase in wages, and he saw calamity in it. He was afraid wages were going to be still higher, and the question to be considered was how they were going to recoup themselves. They were tied by iron bands by the Acts. They could only charge so much a mile, similar to the railway companies, but the railway companies had a loophole of escape by their goods tariff. The tramways had no goods traffic, but Mr. Edwardes' paper showed them the way, though the district Mr. Edwardes had sketched out in Lancashire was very different from his own. Thirdly, regarding the maintenance of cars, Mr. Edwardes was quite right in his remarks there, though he did not like his saying that a car was not a thing of beauty. Personally, he had done away with polished brass rails for some years to save wages and materials and the expense of cleaning. He had done away with the beautiful gold lining, because he had never found that people went into a car on account of there being gold lines inside and out, but because they wanted to travel a certain distance. Still he had the transfer of the magnet, which was very pretty, on each side, and it only required the transfer of the crown to make them believe that it was the royal carriage passing through the streets, except that it was painted green instead of blue. (Laughter.) The track was a very serious item. As they got older, the tracks became more dilapidated. The Act of 1872, which made the undertakers repair the track, was made because in those days the cars were drawn by horses, and the track was naturally destroyed by them.

Nowadays, however, the track was not destroyed by the running of the cars; for they only used the rails. Other heavy traffic with which they had nothing to do destroyed the track for them, and yet they went on year after year promoting tramway bills with all these old-fashioned liabilities hanging on to them. It was like taking up an Act of Edward III. under which, if they stole a sheep, they were liable to be hanged. (Laughter). That was not so nowadays, so why should they be called upon to pay for a track that they did not wear out. Lately, a prominent electrical engineer who knew their needs and requirements had been returned to the House of Commons, and he hoped that Mr. Hamilton's knowledge of the disabilities that the electrical industry in this country was saddled with, in comparison with other countries, would lead him to put his foot down. Perhaps then they would see some alteration in this most unjust burden upon tramway undertakings.

He had ruminated over the problem of the carriage of goods for the last 10 years and he had got out statistics of the various mills in his district and the goods and raw material they had, but he could not see his way afterwards. The tramways shown in Mr. Edwardes' plan had advantages that they did not possess in the West Riding of Yorkshire. The undertakings that Mr. Edwardes alluded to had a 4 ft. 8½ in. gauge and could be physically connected; but in the district that he (Mr. Paris) represented, they had no less than four different gauges, 4 ft. 8½ in. in Leeds, Wakefield, Ossett, and the Yorkshire Woollen, 4 ft. 7¾ in. in Huddersfield—a singular gauge—4 ft. in Bradford, and 3 ft. 6 in. in Halifax. How were they going to run their cars through all those? It would tax the ingenuity of the inventor of the change-gauge truck (Mr. Spencer) to make the same car change gauge for 4 ft., 4 ft. 8½ in., 3 ft. 6 in., and 4 ft. 7¾ in.

Digitized by Google

Goods traffic in that way in the West Riding would be impossible. In Lancashire, on the other hand, it seemed the ideal thing, and ought to be attempted. He might assist Mr. Edwardes by showing him how they dealt with parcels, the smaller part of the goods traffic. They carried parcels from Leeds to Bradford. The Leeds Corporation had nothing to do with parcels, so they could not be carried on that line to Bradford. However, they were carried in a very roundabout way—from Leeds to Wakefield, Wakefield to Ossett, Ossett to Dewsbury, and then on to Bradford. They had had that system for many years, and it had been successful. The collecting company got a first charge and the distributing company got a first charge, and the various towns through which the cars were run got their proportion according to mileage, which could all be settled in a common clearing house. It worked very smoothly and evenly. He had a slight grievance about not being paid enough, but that was owing to their having to do rather more in connection with the transhipment of parcels than any others. There was a break of about 200 yards between the Ossett cars and their cars, and he had to keep a boy to bring on the parcels, book them, and send them on to Bradford. If they were connected up, they could simply transfer them. The whole question of goods traffic was one that provided plenty of food for reflection.

Alderman F. SMITH (chairman of the Liverpool Tramways Committee) said he was glad to have the advantage of the paper Mr. Edwardes had read, and the suggestion contained in it. The proposal in regard to the carrying of goods was excellent. He thought they should make one tramway line abut upon another, even if they had not the same gauges. Regarding the question of wages, he did not think they would ever reach finality. Did they ever want to reach finality in their receipts? Well, Liverpool did not. Their receipts were nearly £1,500 better than last year for the week ending June 7. If the ability possessed by members of the Association was seriously directed to the solution of the problem of the difficulties surrounding the extraction of goods from the docks and carrying them to the nearest point of consumption, they would indeed have done something for which the community would have cause to be extremely grateful. They all desired that the best should be done for the manufacturers of the country, and they must have no vain questions of whether motors were running on their rails and taking out a little bit of their pavement, or whether they were putting down a little bit more than they should do. They must take the law as it was until they could get it altered, and run their undertakings so that they could do enough, first of all, to keep them sound, and then do the best for the public interest in every direction. One of these interests was the carrying of goods from the port of Liverpool all over Lancashire.

Mr. W. CLOUGH (manager of the Bury Corporation Tramways) said that Mr. Edwardes divided the running costs of 12 tramway systems under five heads. He recognised that this table was not intended as a comparison of these 12 systems, but of the ratio of expenditure in each case. He could not at all understand what use the author intended to make of the table, and he would be glad if Mr. Edwardes would fully explain the inferences that were to be drawn from these percentages of expenditure. Assuming the figures to be correct—and this was questionable - the two companies showed up badly in the ratio of expenditure, both on track and overhead equipment as compared with cars, but especially as regards the track. No doubt this feature of the table had presented itself to the author, who might have some explanation to give to them. The only one he could think of was that these companies in the past had not sufficiently maintained the track and that they were now having to meet an increased expenditure. With regard to the maintenance of car bodies, he was prepared to admit that they had reached what ought to be the limit as regarded ornamentation, but he would point out that even in the black country it might be more economical to have the interiors of cars finished with what the author described as the "finest figured wood." When interiors were finished in the style Mr. Edwardes condemned they only required to be periodically cleaned and varnished, which was much less costly than repainting in the style that Mr. Edwardes recommended. To some extent this also applied to the outside panels. They might do without the transfers, even without the "magnet" and the gold lines, but the very fact that the bodies were so well finished in the painting and varnishing rendered the nightly cleaning much cheaper than it would be if they were finished more in the style of a furniture van. (Laughter.) He had taken out the figures for both classes of work, and found that the reduction in cost that Mr. Edwardes suggested was small in comparison with the extra cost of maintenance and cleaning that would be entailed. Mr. Edwardes also stated "my opinion is that the 10 or 20 minutes' is often infinitely better than the 7½ or 15 minutes' service for the simple reason that the former is an easy multiple of time." This he certainly could not agree with, and he thought Mr. Edwardes should look for some other cause when he said that a reduction from 7½ to a 10 and from a 15 to a 20 minutes' service gave an increase of receipts. He could not understand how it was possible, by reducing the number of cars on a route, to increase the receipts. If they admitted Mr. Edwardes' contention they must either give a 10 minutes' service or a 20 minutes' service. There was a big difference between six cars an hour and three cars an hour. A 20 minutes' service might be insufficient and a 10 minutes' service too frequent—indeed the most profitable service might be one of 12 or 15 minutes. He admitted that when they got services at 6, 7½, and 8 minutes' intervals there was a difficulty in reckoning up the times of the cars, especially in the case of the 8 minutes, where it was not the same time after each hour, but he would not for one moment allow such a difficulty to prevent his arranging the exact time table which the traffic required, run with the least number of cars and the least possible running time. For instance, take a route on which the running time was exactly 60 minutes. Six cars gave a 10 minutes' service, but these six cars might be proving insufficient to carry the number of passengers, and if they were to adhere to Mr. Edwardes' principle of an easy multiple there was only one course open, and that was to put on another six cars and give a five minutes' service, which might make all the difference between a profit and a loss on the route. Surely the most economical course would be to put on another two cars and give a 7½ minutes' service.

Turning to the second part of Mr. Edwardes' paper, they came across their old friend "the carriage of goods on tramways," which Mr. Edwardes suggested might help them in two ways, firstly by increasing the receipts, and secondly by driving off the road motor vehicles which did so much damage to the tracks. They were all anxious to increase their revenue, and that morning, instead of opening out idealistic visions of the advantages to be derived from the conveyance of goods, let them look at the difficulties they would have to overcome before they could secure any of these advantages. Mr. Edwardes said he did not know how far it would be practicable to unload goods direct from the steamer on to electrically-hauled wagons and take them direct to the mills and warehouses. They might take it for granted that there was no prospect of getting tracks and overhead equipment installed into the dockyards and railway sidings, or into the mill yards and warehouses. Even if the wheels of the tramway vehicles were suitable to run on railway metals it was impracticable to have tramway vehicles so heavily constructed as to stand the shunting on the railway and dock sidings. Seeing that the tramways approached this question as competitors with the railways, the railways could not reasonably be expected to give the tramways any facilities. If, however, the railways and the tramways were prepared to work a combined scheme, it would be possible to devise a means of conveying a railway wagon and its contents out of the railways siding direct to the mills or warehouses. At the present moment, he had under consideration the conveyance of coal wagons from a private siding to a proposed coal yard, a distance of five miles. It was proposed to construct a tramway track as a short extension of the railway track, but at a lower level, and to run the railway wagons on to shallow tramway trucks, and so convey the railway wagon along the tramway. The first precaution was to get the centre of gravity sufficiently low so as to run no risk of overturning the wagon when passing round curves, and, strange to say, the adoption of the 4 ft. 8½ in. railway gauge for tramways gave rise to the first trouble in this respect. Had the wheels of both trucks not been of one guage, the tramway truck could have been constructed with a less height from the ground.

Co-operation between railways and tramways was out of the question, therefore it would be necessary to have central goods yards in the various towns Now supposing the tramway authorities formed a joint board, with goods warehouses throughout the manufacturing districts of Lancashire, the tramways would be in the same position as the railway companies were in to-day. On the one hand they had a set of warehouses or depots connected by tramways, on the other hand they had a set of warehouses connected by railways, with the admitted additional advantage in the case of the railways that there existed facilities for the exchange of goods, and that they were able to get into the warehouses alongside the docks. The only way in which the tramways could possibly secure any advantage would be in the cost of haulage. Could the tramways carry goods at a cheaper rate than the railways now charge? To answer that let them take a case in point. The railway was asked to convey 25 tons of cotton goods from Bury to Liverpool, a distance of 35 miles, and quoted a rate of 10s. per ton, station to station—a sum of £12 10s. To convey this 25 tons by tramway would require three vehicles, because they must remember the bulk as well as the weight of the material. One vehicle fitted with electrical equipment would cost, say £750, and the other two, without electrical equipment, £500 each, which meant a capital outlay of £1,750. Given a 10 years' life, and the money borrowed at 3½ per cent., there was an annual charge of £236 5s. for interest and depreciation, which, provided the vehicles were in use six days per week, equalled 15s. 9d. per day. The wages and expenses of two men taking the vehicle to Liverpool would be 7s. 6d.; the cost of electrical energy, at one unit per vehicle per mile, at 1d. per unit, would be 8s. 9d.; and maintenance and repair of vehicle, at ¾d. a mile, would run to 6s. 7d.; mileage to be paid to other authorities, at, say, 6d. per car-mile (which was sufficient to cover the wear and tear of track and overhead equipment), would be £2 12s. 6d., making a total cost of £4 11s. 1d., providing that there was a return load. If the vehicles had to return empty, there required to be added wages 7s. 6d., energy 8s. 9d., maintenance and repairs 6s. 7d., mileage £2 12s. 6d., total

Digitized by Google

£3 15s. 4d., or £8 6s. 5d. for the double journey. Compared with the present charges of the railway companies, this left a balance of £4 3s. 7d. with which to pay for the cost of warehousing at each end of the line.

Take the same case, with the goods conveyed by motor. At Mr. Edwardes' figure of 4½d. per ton per mile, this represented £16 8s. 1d., but for this amount the goods were conveyed direct from the mill at one end to the shipping warehouse at the other end Therefore to compare the costs there must be added to the tramway costs the expense of carting and handling at each end of the line. One mile of cartage at each end would be a fair average - say £2 10. The tramway cost would therefore be increased to £10 16s. 5d., leaving a balance of £5 11s. 8d. in favour of the tramway as against the motor, plus any addition that might come from a return load. He had not overlooked Mr. Edwardes' statement that the greater part of this haulage would have to take place during the night, and that between 11 p.m. and 4-30 a.m. there would scarcely be time to travel the 70 miles of the outward and return journey. This difficulty, however, might be overcome by an exchange of crews, which would be quite possible if worked under a joint control. He believed, with Mr. Edwardes, that now the railway rates had been so much increased, and with the increasing cost of petrol, the tramways were to-day in a position to compete successfully with either the railways or motor haulage, and he would be quite prepared to meet with others to consider whether a joint board could not be formed to take up this additional means of revenue. One of the first questions they would have to ask themselves would be as to whether the tramway authorities had power to enter into this work. This was so in the case of his own system provided that not more than 4d. per ton per mile was charged.

Mr. J. W. Dugdale (general manager of Oldham Corporation Tramways) said the haulage of goods on tramways was a matter that should receive the careful consideration and thought of every tramway manager in the country. Especially did it apply to those who were situated in Lancashire and Cheshire. He came from an important spinning district that relied absolutely upon raw material being delivered to the mills. It might be of interest to know that in this parliamentary borough there were 89 cotton mills, with 6,250,000 spindles, while in the Oldham district there were 197 mills, with 14,750,000 spindles. The amount of raw material used in Oldham was 5,000 tons a week; also 1,700 tons of raw material were brought by road from Manchester to Oldham. The total quantity of yarn despatched by road from Oldham to various places amounted to 2,500 tons per week, and the quantity of yarn despatched by road to Manchester was 1,000 tons a week. In Oldham they had 37 carriers who were members of the Oldham and District Horse and Motor Owners' Association, who had 298 horses and six motor lurries. These animals and motors were more or less employed in carting cotton. There were 16 cotton firms with 62 horses that did nothing else but cart cotton, and there were always a large number of coal dealers also who contracted with cotton firms to carry the goods to and from Manchester and district. With all this heavy material passing over their lines, there should be an opportunity to garner in some of this revenue. He thought the difficulties with regard to getting to the sidings might be easily overcome.

Mr. C. D. Stanley (St. Helens Tramways) said he cordially agreed with that part of the paper where Mr. Edwardes dealt with small matters, such as superfluous decorations, and so on. Mr. Clough said that bright-painted cars attracted traffic. Did they? (A Voice: "Yes.") Perhaps in delectable districts in the south they did, but he was inclined to think that the one thing in Lancashire to attract traffic was a good and punctual service. He believed he could send cars out in St. Helens painted slate, and with the handrails painted black, and they would carry every penny of the traffic just the same as now, with the brilliant red paint, beautifully outlined with gold, and all the rest of it.

A Delegate: Will it stand?

He thought it would, for slate colour was less liable to be acted upon by fumes. He did not know which town it was where they spent 15s. annually on each tramway pole, but he agreed that it was a waste of money, and it was actually artistically wrong. A tramway pole was simply intended to be useful, a thing that should be strong, plain, and straight—elaboration was out of place. With regard to the service suggested, his opinion was that service was not determined purely by the actual number of cars required. On one section of the lines with he was connected they discontinued a 15 minutes' service, and put on a 20 minutes' service instead, with the result that the service was more popular, and there was an increase in the receipts. The reason was that loops were very bad in places for a 15 minutes' service. Another remark made was that co-operation between tramways and railways was out of the question. Well, he would question that very much. They in St. Helens ran a very successful system of through tickets to Southport, *via* the Cheshire Lines Railway, and it worked well and smoothly, and was very profitable. Now, if that was possible with passenger traffic, he should think it was not impossible with goods.

A Delegate: They are in competition.

Mr. Stanley: They are in competition, I agree. We are in competition at one point, but at another point the thing happens to fit in, and works very well. Referring to the latter part of the paper, it did seem to him, as between Liverpool and the manufacturing districts of Lancashire, that goods service was bound to come. He understood that some years ago, in one district, there was a difficulty owing to one of the local authorities being rather greedy they wanted a very large percentage; but whether that objection existed now or not, he did not know. He believed that there was a difficulty at one time of getting on to the docks, but seeing how shippers were crying out at the present time about the difficulty of getting goods away from the docks, he did not think that difficulty was likely to be of a permanent order. He did not understand Mr. Clough's suggestion as to the difficulty of shunting tramway vehicles; he himself would have thought that it would have been better to equip electrically the dock side so as to haul goods there. He quite agreed that there were difficulties in hauling goods, if there were not, the thing would have been an accomplished fact years ago. But he could not help thinking that if they put their heads together, and seriously tackled the matter, something could be done. (Applause.)

Mr. C. W. Shepherd (managing director, Edinburgh and District Tramways) remarked that as one who represented what he might term one of the freak tramways of the country- (laughter)—it had been very interesting to listen to the various electrical problems that had been discussed that morning. He was surprised at Mr. Edwardes' statement to the effect that changing from a 10 to a 15 minutes' service had increased his revenue. If they carried everything it was possible to pick up, he could quite understand the revenue remaining the same, but to increase the revenue with a decreased service, in his opinion, was impossible. There must be some difference in climatic conditions to account for this extraordinary problem.

This concluded the discussion, and the Chairman moved a hearty vote of thanks to Mr. Edwardes for his paper.

Mr. Edwardes, in response, said he was very much pleased with the way they had received his paper, and with the interesting discussion which followed. Referring to Mr. Paris' remarks, he apparently agreed with him (Mr. Edwardes) largely, if not almost entirely, in his few remarks in reference to the various extravagances some of them were guilty of; and, no doubt, the reason was that his undertaking was tarred with the same brush. (Laughter.) With regard to the carriage of goods, it certainly did increase the difficulty enormously where the gauges on the adjoining systems were different. He supposed that in Lancashire the gauges were the same; they were more sensible there than in Yorkshire. (Laughter.) They had an arrangement for the carriage of parcels in his area, but unfortunately the neighbouring authorities of Manchester, Bolton, and Liverpool the shopping area for the district—would not have parcels on their cars, which greatly reduced the takings. The discussion on the carriage of goods was certainly most encouraging, and far exceeded his expectations. The gentlemen representing three important centres —Manchester, Bury, and Oldham—seemed quite willing to form a committee to enter into the consideration of this subject, and he hoped that some useful purpose would be served from the remarks made that day. Especially were the remarks of Alderman Smith most refreshing, as Liverpool was undoubtedly the key to the situation. As for his friend Mr. Clough, he never expected for one minute that he would agree with him regarding the cars, because he believed that Mr. Clough's cars were the best painted in England. (Laughter.) He evidently bought from every manufacturer in the kingdom, for they all told him to see Mr. Clough's cars, when attempting to sell paint or varnish. (Renewed laughter.) But he seemed to have misunderstood him on one point. He mixed cleanliness with beauty. It mattered not if a car was furnished with pine, maple, or ash wood, so long as it was perfectly clean. Bright paint, beautiful gold lines, and transfers they might have, but it was "the varnish" that made cars easy to clean. As to the tables he had given, they were intended just to show roughly the proportion of expenditure in the maintenance of cars. Looking through the figures for the first 10 undertakings they certainly compared very well together, but the figures for the two private undertakings certainly varied in some respects, as, for instance, the cost of current. This was chiefly due to the fact that most local authorities bought current from one of their departments, and therefore paid more than the actual cost of generation. The "maintenance of track" figures seemed peculiar, he said, in regard to Mr. Clough's observations, but he would point out that the road authorities were more exacting in the payment for road maintenance than when they had to pay for the work themselves. (Hear, hear.) Mr. Clough, on the subject of the carriage of goods, had flooded them with difficulties, just as they had been for the past 15 years. The great difficulty of running on to railway lines, he thought, could be overcome. He did not see, for instance, in the case of docks, why tram lines should not be laid inside railway lines. Railway companies did not run sidings to mills. There were 100 mills or so in his district, but only one solitary mill had got a railway siding—everything was conveyed either by canal or horse or motor cartage.

The next paper was that on "Tramway Track, 1883-1913." This was introduced by the author in a brief statement which is given after the paper on page 21.

# TRAMWAY TRACK, 1883 TO 1913:

## A RÉSUMÉ FROM A MANUFACTURER'S STANDPOINT.

BY FRED BLAND, M.I.MECH.E.

I must ask the kind indulgence of tramway engineers and managers, who are generally experts in "papers," for any irregularities that may occur in my own. I wanted to postpone my paper until another Congress, but your secretary has "the iron hand in a velvet glove," and he said a certain date, and would not argue further. Therefore it is with some "fear and trembling" that I, as a manufacturer, venture to place certain matters before you, trusting to your tender criticisms, believing that you will find something of interest, in which event possibly at a later date this history may be revised and completed, and form a pamphlet for reference files, dating as it does before many of you were tramway men, but at present the time at my disposal only enables me to give an historical review as expressed by the title selected.

I have endeavoured to avoid "advertising," but it was obviously impossible not to mention the firm with which I was associated, and who were, without doubt, the pioneers in English trackwork. I do not intend to go into details of track construction, its merits and demerits, or I should soon spring a "hornets' nest" about my devoted head, but rather to place before you the advances that have been made in tramway work in my own experience. Much of my paper may, of course, be "old news" to those of you who have studied the past, but there are many who no doubt will find something new. The late Sir J. Clifton Robinson claimed to have the largest intimacy with tramways generally, and I think I can say the same as far as track is concerned, as for the past 30 years I have been closely identified with tramway construction in the matter of supplying material.

Horse tramways existed for over 50 years. The honour of the first street tramway has been claimed by Birkenhead in 1860; but Belvoir Castle claims the first tramway, some portion of which could be seen some years ago. This line was constructed nearly 100 years ago for conveying materials when the Castle was rebuilt after a great fire. A still older tramway is claimed by a local colliery company near Sheffield, where iron plates were laid 200 to 300 years ago to enable the trucks of those days to be dragged out of the pit, and so we advanced to the present system of grooved rails and palatial cars. At all events tramways "existed" before our time, and here and there we come across relics of the ancient days—a single or double-deck car drawn by an ancient horse or a pair of fiery steeds. Liverpool was the first to obtain powers in 1868, and opened in 1869, then London, Glasgow, Dublin, and then came the Tramways Act of 1870 of blessed and unblessed memory.

In 1879 an Act for mechanical power on tramways, which authorised steam to be used, was passed, and was the commencement of the "steel point" era. Of course cable tramways had been laid in a few places before this, but they were rare, the first in this country being opened in 1884 at Highgate, the points and crossings for which were afterwards replaced with steel. At the present day Edinburgh stands proudly alone (if we exclude hill climbing cars). With the Edinburgh track construction in 1887 will always be associated the names of Mr. John Kerr and the late Mr. James More.

About 1882 my old firm of Askham Brothers and Wilson, Limited, saw before them a possibility of new business very different to their old work as steel manufacturers, and with great foresight and judgment decided to go into it. At that time the late Mr. Philip U. Askham was managing director, and he became aquainted with certain financiers who were taking up tramways as a financial speculation—as no doubt some of you will remember was very largely done in the eighties. I was in due course placed in charge of this work, and have remained identified with tramways ever since. Then came the day of the automatic point. The dummy point was found unsatisfactory, and the Board of Trade stipulated that an automatic point should be used upon all single lines of tramways where mechanical traction was to be used. After various experiments the "Marshall" patent point was produced, and laid upon several lines with which we were then connected. Other companies were induced to try these (frequently under free conditions), and the point was found to be so reliable that it was made the standard point, and was the father of all automatic points since that day, and still holds its own. The patent rights were purchased, a great trade followed (as the demand grew, extensive alterations were made in the old works, which were then adapted to the production of points and crossings, as apart from constructional work), and some thousands were turned out per annum.

### FIRST ELECTRIC TRAMWAYS.

In 1883 the first electric tramways at Brighton, by Magnus Volk, and the Giant's Causeway line were laid. Then the first serious track was laid at Blackpool in 1884-5, and my firm supplied the whole of the material for the conduit, consisting of channels, chairs and accessories, and the points and crossings, to the specification of Mr. Holroyd Smith, of Halifax, and there are portions of this old track still to be seen in side streets, and a section ought to be preserved for posterity to see the difference in conduit work in 20 years. Then came the overhead trolley, which opened out a new era for manufacturers of electrical plant, and doubled the demand for steel points and crossings, and the works for some years were at high pressure, turning out some scores of points and crossings per week.

In November, 1891, the first trolley line was opened in Leeds. I remember being present, and still have the medal subsequently struck. Leeds adopted the Marshall point, and their example was followed generally throughout the country. Then followed the Bristol tramways, constructed by the late Sir Clifton Robinson (whom I met on several occasions), and who afterwards built the Dublin and Southern and Middlesbrough tracks, and later on the London United Tramways. Then the South Staffordshire Tramways, which were opened on the New Year Eve of 1893. Mr. Carruthers Wain was the chairman, and there was a great gathering of the original Tramway Institute, of which I was then a member. The conduit system, an improved cable system so far as the ground plant was concerned, was adopted by the London County Council, but London was, and still is, the only place in Great Britain where this system is in use, but as I am dealing with personal experience only, I merely mention this in its proper order.

In 1896 came the Light Railway Act, and this again caused an increased demand for trackwork, 1898 to 1903 being years of great activity. America appears to have first used rails and flanged wheels in the streets, and when electric tramways were first introduced here it was thought that the best thing was to adopt American cars, American wheels, and American track. Now English cars are used, American wheels are practically abandoned, and English manufacturers can hold their own against American track material. Using American wheels of chilled iron was a retrograde movement (which has been proved by the general adoption of steel tyred wheels), because under steam traction all the engine wheels had steel tyres, and if chilled wheels were unsuitable for steam they were doubly so for electric cars, but America used chilled wheels, consequently we had to do the same. The writer was always opposed to these, and supplied the first steel-tyred wheels that were used—viz., in 1894, to the South Staffordshire Tramways Company, Limited—and in looking over some old papers I found a letter written on March 26, 1895, by Mr. Alfred Dickinson, who was then engineer to the South Staffordshire Tramways, and I have ventured to include it, not as a testimonial, but as a prophecy since fulfilled:

7 ft. 6 in. 1882. | 9 ft. 6 in. 1892. | 12 ft. 1902. | 15 ft. 1912.

*26th March, 1895.*

"DEAR SIRS,—Your letter of the 23rd inst. The records for the set of tyres show considerably over 40,000 miles. When the use of steel tyres for electric cars is more fully appreciated I feel sure that they will be exclusively used."

Steel-tyred wheels were supplied to Bristol in 1898, Halifax and Bradford in 1899, and in 1900 the question was discussed with Sheffield,

Digitized by Google

because of the numerous fractures of chilled wheels in entering the points, which was one of the reasons for tyred wheels being adopted.

### SYSTEMS OF TRACK AND RAILS.

1. The earlier systems before 1870 were usually the "Box" rail, laid upon longitudinal sleepers, or on C.I. chairs, and this was carried forward up to 1890 upon many lines. The Sheffield track was entirely upon this principle, as we laid the first loop ends with girder rails in 1896, and this was an example of the country generally preparatory to electric traction.

2. The "Kincaid" system, as laid upon the old West Metropolitan Tramways.

3. The "Barker" system, as laid upon the old Manchester, Bury, Rochdale and Oldham Tramways, long since relaid.

4. The "Vignoles" system, as laid upon the North London Tramways and the North Staffordshire Tramways. Incidentally this rail shares with Dundee the honour of being the only two tramway rails ever rolled in Sheffield. This rail was designed by Mr. Henry Vignoles, together with Mr. J. W. Newton, the leading tramway engineers of that day.

5. Then crept in the girder rails, Dick, Kerr and Company, Limited, laying the Kerr system at Wigan, etc., upon continuous iron or steel sleepers, also upon cross sleepers. Bradford also had a similar type known as the "Winby and Levick." Then the girder rails gradually grew in size and weight from 45 lb. to 105 lb. per yard.

6. Then came the British standard rails, which now hold the market, if we consider that since 1907 125,895 tons of B.S.S. rails have been rolled in this country as against 38,537 tons of other sections. But these sections are again under revision by the Engineering Standards Committee; and as Liverpool have adopted a much heavier rail of 134 lb., and Leeds a section of their own, and Manchester also have slightly departed from the "standard," the word "finis" will not yet be printed.

When we consider that at one time nearly every tramway company had its own section of rail, as engineers, who had the purchasing powers wanted their own way, and generally got it (now, however, the British standard rail has stopped a great deal of this), I have ventured to show on the large wall plan a collection of these rail sections, which I can guarantee accurate. I think an examination of this plan will be interesting, and will show the progress in rails more than any written description, and at the same time will give you an idea of the number of different patterns then required to suit the various sections, and which alone is an answer to those who ridicule the statement that manufacturers want to standardise. At the time I refer to the only Corporation tramway was Huddersfield, and that was because no one would take the running off their hands. Now there are 99 municipal lines.

*Rail Joints.*—In the olden days fish plates were used, of all kinds, from ⅜ in. thick, and it is astonishing what little trouble the joints caused as compared with the present, and—I mention this with a whisper—corrugations were unheard of. Many tracks used the Marshall sole plate, 16 in. to 24 in. long, by ⅜ in. to ⅝ in. thick, by 10 in. to 12 in. wide, with clips and bolts to hold down existing rails, and with longitudinal strips bolted through the rail flange for new work, and in several cases when the lines were relaid these joints were found to be intact. Where electric tramways adopted these they had little trouble with the joints, *par exemple*, Nottingham, where the original lines were laid with these plates, which are still in use. Then came the inverted rail, the H girder, the cross rail, the C.I. anchor, the grip, and many others, especially when the rails began to be welded by the Falk, Thermit, Tudor, and other systems.

*Continuous Fish Plates*—These have been very rarely used, notably Derby, Birmingham, and a few odd places; but there is no doubt that they make a good joint on the main track, but are difficult to fit on points and crossings, and require special arrangements to be made.

*Tie Bars.*—These at first were flat bars, 2 in. by ½ in. to ¾ in., bent over at each end, and laid under the rail or chairs. Also angle bars, 2 in. by 2 in. by ¼ in., fitted with four clips, the outer clips being riveted on, the inside clips bolted on, and with a centre base plate to carry the girder rail. Channel bars, 2 in. by 2 in. by ¼ in., were also used in a similar manner. Then came the centre tie bars, screwed each end, as used at the present day, also tie bars with one slot end, but which necessitate extra road opening whenever the rail carrying the slot end requires relaying.

*Bolts.*—¾ in. was a common size, ⅝ in. was strong, and 1 in. was exceptional. Now 1 in. is a standard size; four bolts only were used against six and eight now. Iron bolts were commonly used, but we instituted mild steel bolts fitted with various lock arrangements—the Privet, a metal washer with a catch arrangement; the Grover spring washer, the Thackray, and then the Lock Nut, the Eureka, Helicoid, Keen and Ibbotson's.

*Drain Rails.*—In 1892 Mr. W. H. S. Dawson, the assistant surveyor of Bradford, brought out his patent drain rail, consisting of a C.S. rail, 6 ft. to 9 ft. long with box combined, which had a great sale, but fell into disuse because of the extra joints and harder material as compared with the running rail, simple drain boxes attached to the running rail being now the standard, either trapped or untrapped.

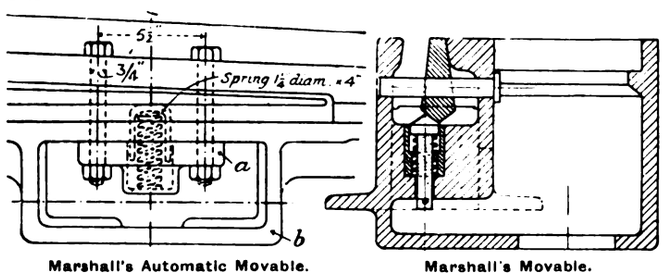
### POINTS AND CROSSINGS.

The seventies was the "Iron Age." Originally, chilled iron points were used, consisting of a movable and open point at junctions, such movable point having frequently a tongue of only 1 in. deep, and from 3 to 6 ft. long. At passing places, a dummy and open point were used, the dummy point being one through which the cars could *not* run, and merely consisted of one groove raised ¼ in. to ⅜ in., which sent the car to the left hand, and in running out the car "dropped off" into the running track. In many places both points were open, and the drivers pulled the horses half-way across the road until the car wheels had taken the correct road. In fact, anything was good enough upon some lines so long as the car could run *on or through* the point, and weird and wonderful were many local examples I have seen scrapped. Miller and Company, Limited, Edinburgh, were the principal makers, and their points ran far into the nineties upon many girder tramways where horse traction was continued, and I have to thank them for many courtesies extended to me, as a rival in past years. The first points used for steam cars were, however, on the same principle of dummy and open, but in many cases the dummy portion was a renewable insert fastened in by cotters (and not run in with spelter as inserts now are), and these I may say were the forerunners of insert work (nearly 20 years before the Americans placed their work in this country). I wonder what engineers would say now if they had to take up 34 ft. of rail to replace one point, which was often the case, because fish plates were frequently cast *in* the points and not fitted on the ends, but to renew crossings entailed even more road opening.

*Steel Era.*—As stated, chilled-iron points were the regular practice, but my firm at once placed on the market a crucible cast-steel point, which, while dearer, was tougher and more durable, and the first steel points used in England were laid upon the North Staffordshire tramways and the North London tramways, both of which concerns were constructed together. Then came the Manchester, Bury, Rochdale and Oldham tramways, the St. Helens, Wigan, Darlington and Stockton, Middlesbrough, and West Metropolitan tramways, followed by others. Nearly all points for the main track were then made straight, 7 ft. 6 in. and 8 ft. 6 in. long, radius points only being used upon sharp junctions and at depots, the curve being a true radius from the toe of the points. Crossings also, were all straight, but always of the frog type, whereas now they are chiefly "leg" ends, to ensure better joints. Where required for junction work they were made the angle of the radius, and being short worked well.

*Automatic Points.*—Marshall's was high above all others. Kenway had a movable point, with a spring inserted in the toe end, but this "jammed" frequently. Kenway also patented a swell point, which had the side of the R.H. tread swollen out to throw the cars to the left, and alternatively had a recess for a "jumper" to be inserted, but these were not successful. "Phillips' rocking jaw" point had a short life. "Chapman's" point had a brief life, and worked well, but was more expensive. The principle was a weighted lever—the tongue being depressed when the car ran over it—as against the Winby point, with a leaf-spring lever. A dispute as to patent rights took place between these two patentees, lasting over two years, and costing a good round sum of money. Askhams, as manufacturers, were the defendants. The first trial was won by the plaintiff. Then the appeal was given against them, with an order for a new trial at the County Palatine Court, Liverpool. Final result, a verdict for the manufacturers. Net result, no more points used of either kind. The present Justice Sir J. Fletcher Moulton was counsel for Askhams at the second trial, and many leading engineers of that day were subpœnaed on either side. Then further mechanical points were asked for, which produced several types—viz., Tadpole, Marshall, Allan and Robinson three-way, Allen and Warlow three-way, Hadfield three-way, which are now in use.

*Manganese Era.*—In 1901 manganese steel was introduced. Trial points were laid in High Street, Sheffield, but the first track to be constructed with manganese points was Salford, and for three or four years crucible cast steel and manganese steel were rivals in the field, but now manganese practically rules the market, either "Imperial" or "Era." Some tramway companies, however, still adhere to the cast steel, whether with inserts or without, but crucible cast steel had its limit in length and weight.



Marshall's Automatic Movable.

*Modern Track.*—At present there are in use four types of points—solid manganese steel, solid cast steel, cast steel with manganese steel inserts, and built-up points of the continuous type, and five types of crossings—solid manganese steel, solid cast steel, cast steel with manganese inserts, iron-bound with manganese inserts, and built-up crossings.

The chief angles of crossings are:

| For Loops. | Frog Type. | Leg Type. |
|---|---|---|
| 1 in 5 | 4 ft. 0 in. long | 7 ft. and 8 ft. 1 in. long. |
| 1 in 5½ | 4 ft. 0 in. „ | 8 ft. long. |
| 1 in 6 | 4 ft. 6 in. „ | 8 ft. 6 in. and 7 ft. 2 in. long. |
| 1 in 6½ | 4 ft. 9 in. „ | 8 ft. 6 in. long. |
| 1 in 7 | 4 ft. 9 in. „ | 9 ft. long. |
| 1 in 8 | 5 ft. 0 in. „ | 10 ft. 6 in. long. |

For Crossovers.
1 in 4½, 1 in 5, and 1 in 6.

For Interlacing Track.

| | | |
|---|---|---|
| 1 in 6 | 4 ft. 6 in. long | 8 ft. 6 in. long. |
| 1 in 8 | 5 ft. 0 in. „ | 10 ft. 6 in. „ |
| 1 in 9 | 6 ft. 0 in. „ | 11 ft. long. |
| 1 in 10 | 6 ft. 9 in. „ | 12 ft. „ |

Points now are: (*a*) Automatic, with open mates; (*b*) double automatic, working independently; (*c*) double movables, with centre box and connections. The usual length is 12 ft., curved right and left to suit side loops, or curved equally to suit diamond loops, the chief radii being:

| | | |
|---|---|---|
| 75 ft. | Lateral by | 10 ft. long. |
| 100 ft. | „ | 12 ft. „ |
| 150 ft. | „ | 12 ft. „ |
| 200 ft. | „ | 13 ft. 6 in. long. |
| 300 ft. | „ | 15 ft. long. |
| 200 ft. | Equilateral by | 12 ft. long. |
| 240 ft. | „ | 11 ft. 2 in. long. |
| 350 ft. | „ | 15 ft. long. |

Curved Track.—Present Day.

Some tramways still use 10-ft. and 12-ft. straight points, and where the leads are suitable, these give good results. The question of standardising the radii, angles and lengths is now being considered by the Engineering Standards Committee.

*The Points.*—These are fitted with manganese steel or forged steel tongues, at the option of the engineer, the latter type being the most convenient when renewing tongues in old points. These were, and still are, fastened down with a cross bolt at the toe and a pin at the heel, which, if properly fast, is the best principle for a working tongue. At first the pin was riveted through the tongue, the head in time being worn away, and consequently becoming loose; the other method being to "run" the pin in a recess underneath the tongue with spelter, or preferably cast iron, and is the method we adopt, having put down special appliances for dealing with same. A demand, however, has been made for a pinless tongue, and there are now three or more types on the market, more or less an extended principle of the "McKnight" heel adjuster, used upon short points years ago. There are the "Allen," the "Era" or "Hecla," and the "Tadpole" types, all of which are good.

Types of Crossings.

*Terms "Right and Left Hand."*—If the observer stands at the toe end of the points the running tread is on either the right or the left hand, independent of whether points are straight or curved, but foreign terms "left and right" always mean curved to right or left, and mean a pair in all cases. "Open," "neutral," "dummy," or "mate," are terms for the point working with a movable, irrespective of curve or hand. "Dummy," however, was the term for the R.H. point, which had a high groove as against the open with two grooves. Grooves are now generally raised in both the mate and the crossings, usually to ½ in. deep. In diamonds, or curved junctions, or level crossings, the groove should be raised throughout, and should end "square" to obtain the best working results. Laying is an important adjunct to successful working, and the L.H. groove should always be straight or in a line with the running rails at loop ends.

Digitized by Google

*Mechanical Controlled Points.*—It is astonishing how this idea has cropped up during the past 25 years. Nearly 100 different patents have been taken out for a point to be worked mechanically from the tramcar, but there was a perfect wave of mechanical points about 1900, when Glasgow invited inventors to submit their designs for this type of point, and we were simply inundated at that time by "all sorts and conditions of men." Many were ingenious, few were worth experimenting with, but a fair sum of money was spent in experiments, with no practical results. A mechanical controlled point is absolutely out of date, being superseded by the electric point controllers. The first adopted was the "Turner," now well known throughout the country. "Parr's" point was also tried, then came the Tierney-Malone point, as now installed in Dublin and Belfast, the Collins, the Stoffel, and the Dodwell.

*Silencers, or Silent Points.*—In 1901 Mr. McKnight, a Liverpool merchant, had the idea of producing a silent point, and spent a considerable sum of money in experimenting, the result being what is now known as the "McKnight silencer." This was adapted for both "push" and "pull" points, to suit the requirements of the two-point manufacturers, and a good sale took place. A little later, according to market terms, "silencers were quiet," and the demand has been intermittent since. The idea was to reduce the noise at passing places where a spring point was constantly working, and there is no doubt that the comfort is worth the extra expense.

*Curves.*—Originally upon sharp curves a high lip was used on the outside from $\frac{3}{16}$ in. to $\frac{3}{4}$ in. high, either as part of the rolled rail, or riveted on the side. The Board of Trade later on objected to these, and many were taken out, but some still remain. Then as sharp curves rapidly wore out, the best method of dealing with same became an important question. There are now several types, but without doubt the best are—(1) a solid cast manganese rail curved to radius; (2) a rolled manganese guard bolted on, either as a flat bar, or preferably a "section bar," known as the "Holt guard," fastened with chairs and bolts, which I think gives the best results; (3) a cast guard, known as "Bulfin lip," bolted on to the rail, which has given good results; (4) the London County Council section of guard, which can also be rolled in manganese steel.

*Loops and Turn-outs.*—These were also different to the present systems. Where possible the loops were laid with a perfectly straight run in at each end, and always with straight points and crossings, and this loop is still the easiest to work. Now the loops are either diamond or lateral loops, and with curved points.

*Cross-overs.*—These were frequently laid both right hand and left hand. The Dublin Southern was laid right and left alternately at very short distances. *En passant*, this line, I think, is the only one that runs express cars morning and night with three stops in nine miles, the earlier cars being shunted to let the express pass. At first for cross-overs the movable was the right-hand point, either automatic or a movable, but we substituted the left-hand movable point instead, thus ensuring an easier run through, which is now the standard practice.

*Junctions.*—A very great improvement has been made in the laying of special work. Everything is now set out, and curves spiralised, and principally built up at the works, so that everything can be tested before laying, whereas previously the jobs were laid on the ground, to the best ideas of the local engineer, and oftentimes the ganger was the chief authority, and many junctions have I seen fixed in this manner. Loops also were often laid in the same way, and when the crossings were scarfed from the rails the ganger fixed the position, and the rails were cut to suit. I remember upon one important line 26 different patterns had to be made for renewals, where certainly six would have done. In those days all tracks were laid by contractors, and one had to deal both with the contractor, his engineer and resident engineer, who if they did not work together, made matters very uncomfortable.

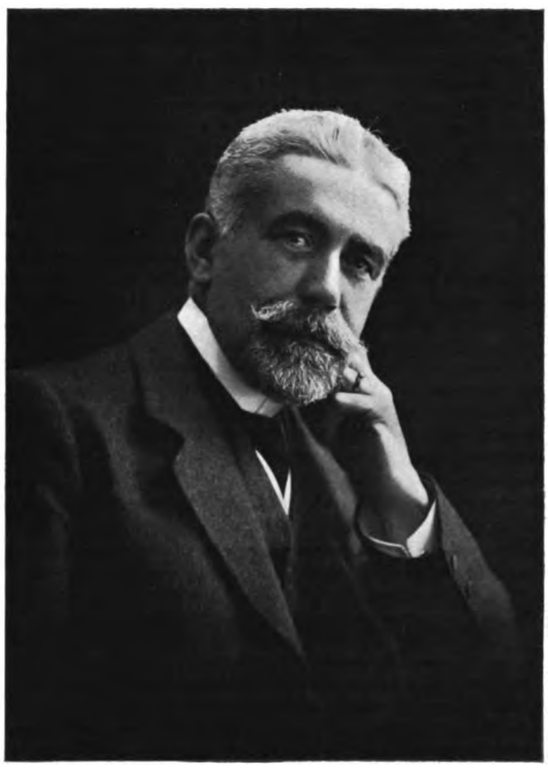
*Light Railways.*—The first tracks to be laid on sleepers on the road-side were at Kinver and Kidderminster. The points for the latter have just been renewed.

*Level Crossings.*—A great feature during the past few years has been the growth of cast level crossings for tramways crossing railway tracks. Until recently it was almost impossible to persuade railway engineers to cut their rails, even for street crossings. The North Eastern Railway, however, permitted this in Middlesbrough on a goods line in 1897; but at Hull, where passenger trains ran over, it was not successful, and only recently have they reopened this matter because of the unbreakable quality of manganese steel. The Great Central Railway, however, hold the premier position, as at Grimsby there were two level crossings laid in 1901, and the whole of the dock traffic, which is very heavy, has passed over continuously.

*Tramway Association.*—The first meeting of the original Tramway Institute of which there is a permanent record was at Bradford in 1892. At that meeting a reduction in rate assessment was asked for, and this question has been continually open. Our esteemed friend, Mr. Fearnley, the president of the Municipal Association, was then present, also Mr. T. B. Goodyear, now at Croydon; Mr. Mozley, of Burnley; Mr. Vaux, who was then one of the Bradford managers: and Mr. Courtenay, of THE TRAMWAY AND RAILWAY WORLD, and these gentlemen, with myself, were, at the time of writing this paper, the sole representatives at the present day out of 75 then present. In conclusion, I trust that, however meagre my paper may have been, it has contained something of interest to all of you.

## THE DISCUSSION.

Mr. FRED. BLAND, in introducing his paper, said he was pleased to have been able to place before them the paper as printed, and he would content himself with speaking to them on a few special points that he would like them, as tramwaymen, to consider. The printed paper, he remarked, could have been made much longer, but he preferred brevity to weariness. He had been told that there was very little contentious matter in it, but, as a manufacturer, it was difficult to give such a paper, and avoid advertising. Some of them, he thought, could "pick holes" if required. Referring to a large chart, showing the various types of sections of rails from 1883 to 1913, with a special section devoted to British standard rails, Mr. Bland said he would first of all ask them, "Why have so many rail sections?" Why should they not have two, or, at the outside, three sections, say, 6 in., 6½ in., and 7 in., and let them adopt these generally. By so doing they would simplify matters for manufacturers, with the result that there would be cheaper production and improved deliveries, as the



**Mr. Fred Bland.**

manufacturers could stock with safety. In this connection he would select No. 4, 7 in. rails, as being the best standard at present. Another suggestion was the adoption of standard radii points in their renewals, taking a 150 ft. radius as the standard. Experience showed this to be the radius that replaced the old loops most economically. Then they could have a radius of 100 ft., and another of 200 ft., for special work; and either a 200 ft. or 240 ft. equilateral for diamond loops would meet a lot of difficulties that tramway managers had to contend with. Also they should adopt standard types of points—automatic and open makes on country roads, and double-tongue points in towns, where the points were constantly cleaned, and upon all facing points. With regard to the question as to whether or not the tongue should be fitted with a heel pin or be pinless, he personally preferred a pin with a heel adjuster. Let them also raise all grooves of open points or crossings on turn-outs, etc., to ½ in. deep; but in double junctions where cast connected crossings were used, as at present, he suggested carrying the raised groove throughout, and, if they would pay more, then carry the grooves out square across the track, thereby ensuring easier running. He also advocated a rail with a groove rolled in it for curves; and this, by the way, had never been considered in this country—why, he did not know. There was also the question of what type of renewal guard was most suitable for sharp curves. Further, he would suggest that on emergency cross-overs, other than terminals, they should

Digitized by Google

abolish the old crossings, and put in unbroken tread crossings, or use a long rail and bolt on wing crossings for the cross-over track, for by so doing they would reduce their repairs and get easier running. All these were matters, he concluded, that were worthy of their consideration as tramway men, and he would be very pleased indeed if some of them would take them up. (Applause.)

The CHAIRMAN here said that they had amongst them one of their original members, Mr. H. M. Sayers, and they were glad to welcome him back, and he would ask him to speak. (Applause.)

Mr. H. M. SAYERS (resident engineer, City of Santos Improvements Company), whose rising was greeted with applause, said the main thing on which improvement was required was the special work of points and crossings, but more particularly of crossings. It was very curious that during the last three years he had had to use points and crossings made by two English manufacturers, and "Vignoles" rails by an American manufacturer, and he had had to send all the crossings into the machine shops before they could be put into the track. The reason was, the raising of the groove was insufficient, and it suffered from the wheel flanges catching the point of the diamond. He also had to complain of the angles of the crossings, and also about the points of the diamonds, and this had happened although the manufacturers knew very well the gauge of the track, the wheel base length, as well as the radii of the curves. However, he must say that manufacturers succeeded very well as a general rule in constructing special work in the way of curves, crossings, and junctions, where they were given the full elements of the radii, points, etc. He had had to put in, during the last three years, 96 crossings and junctions of various sorts, all of which were constructed in England from drawings sent out from Brazil. He thought that it was very creditable to the manufacturers here that there were very few cases of adjustment being required when they came to put them together. That showed the extraordinary care they took both in designing and the final lay-out. With regard to points, he thought there was hardly enough care taken in regard to the tongues. There were a good many places where tongues became bent or worn, and so became unworkable. They were then, of course, immediately changed, but this meant that traffic had to be suspended, and all work had to be done at night. With regard to rail sections, he was very well satisfied with the grooved rails of British standards—the only thing he would say was that all the heads should be similar in width. At the present time the heads were of different widths; and he thought this was a mistake. Alluding, in conclusion, to the chart showing the great number of rail sections, he thought it represented an enormous waste of energy. It was very interesting historically and from a museum point of view, but he sincerely hoped that these sections would be cut down to about half-a-dozen approved types of rails. (Applause.)

Mr. A. R. BLACKMAN (chief engineer, Belfast Corporation Tramways) said that in consequence of adopting Tierney's automatic point shifters they had been able to do away with point boys in the streets.

Mr. H. E. Blain (manager of West Ham Corporation Tramways) was then called upon by the Chairman, who said that probably they were all aware that Mr. Blain had resigned his position at West Ham, but he hoped that the Association would not lose the benefit of his services.

Mr. BLAIN said they would no doubt have observed that the screen behind the Chairman's back had been upheld for a very significant reason, for if it had been dropped no doubt they would have seen on it the words "England expects every man to do his duty." That was probably the reason why Mr. England had called upon "all sorts and conditions" of them to make all kinds of unexpected remarks. (Laughter.) He (the speaker) felt that he was neither "fowl, flesh, nor good red herring" at that moment—(laughter)—but he was exceedingly obliged to the members and officers of that Association for their courtesy in extending to him the invitation to be present. And he must compliment them on the excellent arrangements made. He must say that he had been connected with many other organisations, but in Mr. A. de Turckheim they had a secretary *par excellence*. (Hear, hear, and applause.) He had no special remark to make about the paper, although he did think it was of distinct value from an historical point of view. (Applause.)

Mr. W. B. PICKERING (of Sheffield) congratulated Mr. Bland on his paper, which had been very interesting, especially to the younger members of that Association. (Hear, hear.) Since the introduction of tramway traction, he said, manufacturers had come to the rescue of the tramway men: and they had provided them with a better type of point and crossing than existed in the early days. But that did not say they had reached finality. Mention had been made of the length of tongues—well, that was a matter not in the hands of manufacturers, but for which tramway engineers were largely responsible. Manufacturers to-day were turning out tongues from the same pattern that were absolutely interchangeable. He asked the delegates to that Congress to consider seriously the advisability of not increasing the present number of sections. From the manufacturers' point of view it was exceedingly difficult to meet the demand made on them; and they would greatly help manufacturers by not increasing the number beyond a dozen.

Mr. E. H. EDWARDES (general manager, South Lancashire Tramways Company), referring to the diagrams on page 670 of the paper, showing comparisons in lengths of points, said that in 1882 the length was 7 ft. 6 in., and in 1912 it had got to 15 ft. Was that to go on increasing? It might be an advantage to the manufacturer, of course. (Laughter.) Mr. Bland had also referred to "silencers," and recognised them. Well, he (the speaker) had tried them, but owing to some neighbours complaining about the noise they made, they had to be taken off. (Laughter.)

Mr. H. HEWER said that without going into the historic features of the subject, there was one point which required some comment, namely, the position to which the author would relegate "insert" construction. In Manchester, Glasgow, Newcastle, and many other towns in this country, this type was preferred, or at any rate accepted on an equality with solid manganese steel, because it was more economical, and gave better satisfaction in many respects. The author seemed to suggest the use of independent movable points. This, he thought, was bad practice, as any slight obstruction might interfere with the movement of one tongue, and so cause derailment. If two tongues were required, they should always be connected. He was surprised to note that good results were still claimed for the old straight points, as obviously it was against all codes to divert a car on a sudden tangent. Reference was also made to the use of manganese steel tongues. This metal was unsuitable for this purpose, unless the tongue was reinforced to give additional lateral strength and bearing. Manganese steel offered a high resistance to abrasion, but was non-resilient and ductile, consequently the usual thin tongue was liable to become bent by the pressure of the car wheels, and so threw a car off the track.

Alderman H LINSLEY (chairman of Salford Corporation Tramways Committee), who was present as a representative of the Municipal Tramways Association, was then welcomed by the President, and said that he was there as a listener, not an expert, and he was glad of the opportunity to hear their debates.

Mr. C. FURNESS (electrical engineer and tramways manager for Blackpool Corporation), on rising, responded to the Chairman's call, and was warmly received. Like Alderman Linsley, he said, he was a listener. But speaking on the paper, he said he had one strong objection to the present methods of track laying. It was not so much in regard to points and crossings, but in the foundation. He had come to the conclusion that more than 70 per cent. of the troubles experienced by tramway managers was due to bad foundations of the track. He advocated a "cushion" foundation by placing timber between the rails and the concrete, and in proof thereof he said they in Blackpool had a length of track in Station Road, South Shore, where delegates interested would have the opportunity of judging of the silent running of the cars. He was watching this section closely. It had been laid down for two and a half years, and there had been no movement of the rails. The track was laid down on timber 9 in. by 5 in. It was a very good job, and he should like to see the whole of their track on the Promenade laid like it. The delegates, he added, would realise on the morrow, when they travelled on the Blackpool and Fleetwood tramroad, the nice "cushion" effect. From the moment they left the Blackpool boundary they would hear nothing of the hard grating noise of a concrete foundation.

Mr. R. HUMPHRIES (chief engineer, Birmingham and Midland Tramways Joint Committee), speaking as one who had some 60 miles of tramways to look after, said their chief trouble as to track had been with the concrete bed. He quite agreed with Mr. Furness in his remarks about sleepers. They had a great deal of track in the "Black Country," and in some cases they had lost concrete foundations laid years ago. Where it had gone to he did not know—unless the miners had excavated it and were disposing of it as coal, which might be the case judging by the quality of the coal they got. (Laughter.) Now they were running on a sleeper construction for miles, and the track gave far less trouble, and the cars ran far more quietly and cheaper than where concrete was used. They had scrapped their chilled wheels, he went on to say, and had equipped all their cars with tyred wheels, and they had been running much more smoothly round their curves ever since.

Mr. T. C. TEGETMEIER, chairman of the Auckland Tramways Company, corroborated what had been said about foundation of tracks. Their track in Auckland was originally constructed upon longitudinal concrete sleepers Now, the concrete was broken up, and the sleepers were laid without concrete upon the broken up mass of concrete previously existing. It formed an ideal track, and the result was that the running of cars was much more easy, and the cost of repairs very much less.

Mr. A. W. A. CHIVERS, as the permanent way engineer of the British Electrical Federation, who had some 450 miles of track to keep under repair, emphasised the point that conditions varied in different parts of the country. A system of track construction might suit one district but not another. Take Greenock, for instance. There they had traffic in boilers, 60 or 70 tons weight; and these were very destructive to the permanent way.

The Congress then adjourned until the following morning.

## FRIDAY'S PROCEEDINGS.

The Hon. ARTHUR STANLEY presided over the Conference proceedings on the second day, and expressed his thanks to Mr. England for having taken the chair during his absence on Thursday, and called upon him to introduce the following paper:

# RAILLESS TRACTION LEGISLATION

AND

DIGESTS AND ANALYSIS OF THE PRIVATE ACTS WHICH HAVE BEEN PASSED BY PARLIAMENT AUTHORISING THE CONSTRUCTION AND WORKING OF RAILLESS UNDERTAKINGS AND TROLLEY 'BUSES.

BY HARRY ENGLAND

*(General Manager, Yorkshire (West Riding) Electric Tramways Company, Limited).*

I intended to expend my energies in compiling a digest and analysis of the various railless traction Acts which have been presented to Parliament by Corporations and companies, and which have received Parliamentary sanction. I further proposed to make some brief comments bearing upon the mutilated Light Railway Bill of last year, which included some provisions ostensibly framed to cheapen and facilitate the promotion of railless schemes. The scope of the paper gradually widened, and I received requests to include some details of the running costs of trolley cars if possible, and also to describe the various systems of overhead line and cars now offered by contractors in this country. By the kindness of my friends, Messrs. Hamilton, Spencer, and Cross, I have been able to obtain, and now publish, the costs of operating trolley cars in Leeds, Bradford, and Rotherham, and, as regards the description of systems, I have briefly touched upon the salient features of each. I trust those present will accept this explanation and apology.

### RAILLESS TRACTION LEGISLATION.

This paper will be incomplete without some reference to the Government's Light Railway Act of last year, because, as most of you remember, the Government proposed to include clauses by which a trackless trolley system might be authorised by Order under the principal Act in the same manner and subject to the same conditions as a light railway. The first clause of the bill was the most important to us as promoters of railless schemes, because the Board of Trade always have been prohibited from confirming an Order made by the Light Railway Commissioners if the scheme was of great magnitude or competitive with an existing railway. The bill proposed to empower the Board of Trade to promote a bill for confirmation of their Order, and I think we may assume that a bill promoted by a Government department would receive the favourable consideration of Parliament, and that portion of the proceedings would be less costly than a private bill.

The Standing Committee mutilated the railless portions of the bill to such an extent that it became impossible, and on strong representations being made by the Tramways Associations the Government deleted the railless clauses, and, as regards general legislation, we are as we were before the bill was promoted. We could not allow, without straining every nerve to prevent it, any clause appearing in a bill of this character making it incumbent upon us to obtain the consent of every road authority concerned. The idea is preposterous, because any petty authority exercising control over a few yards of road would be in a position to exact onerous and unjust terms, or even to veto the scheme, and our condition would be infinitely worse than it is to-day.

The Standing Committee also amended the bill by inserting a clause making the owners of trolley cars responsible for road maintenance. I propose to deal with this question when criticising the road maintenance clauses of the various private Acts. My point in introducing the defunct railless clauses of the Light Railways Act in this paper is to interest you in the crying need there is for legislation that will cheapen and accelerate applications for powers to run trolley cars.

It is a sad commentary, and does not redound to the credit of our common sense as a nation, that to enable us to do works and run trolley cars we should have to go through so many time-wasting formalities and to expend so much of our capital uselessly. Under the present law a scheme promoted in the autumn of one year may receive the Royal Assent in the month of July following, and only then after the expenditure of many, many hundreds, nay thousands of pounds sterling that might have been usefully employed in building the line. In a small trolley car scheme the costs of the Act and incidentals would form a major part of the capital employed, and surely some means can be devised to overcome this drag upon enterprise! No wonder companies shirk this procedure and expense and fly to motor 'buses as the alternative which offers immediate results and no outlay on legislative idiosyncrasies!

Well, gentlemen, to some extent the remedy is in the hands of the two Tramway Associations, and so long as we are content to keep our grumbling within our own ranks, and we do not make our voices heard and our wants known, so long shall we suffer the disabilities of unnecessary, costly, and tedious formalities.

### DIGESTS OF PRIVATE ACTS.

In the following digests of private Acts I have attempted to give as briefly as possible the clauses which are interesting to members of the Association who may be contemplating railless traction, and I hope these will be of some service, not only to us to-day, but for reference afterwards, and, with your permission, I will now deal as briefly as possible with the provisions of the various Acts. Eighteen private Acts in all have received the sanction of Parliament, and of these 15 have been obtained by local authorities, and three by companies.

*Time Allowed by Acts for Completion of Works.*—The minimum time allowed for completion of works authorised by any of the various Acts is two years from the passing of the Act, and the maximum is five years. In some cases it will be seen from the table that no time is stated in the Act, whilst in the case of Rotherham the powers granted cease at the expiration of a certain period if the works are not constructed or to so much thereof as the Board of Trade may approve. If it is necessary for any period to be stated in the Act, I think the Rotherham provision is a very wise one, because unforeseen difficulties may occur which would unduly prolong the period of construction, and the Board of Trade should be empowed to grant an extension of time.

*Vehicles.*—What may be regarded as a model clause is incorporated in almost all of the Acts, viz., that the form, construction, and dimensions of trolley vehicles shall be subject to the approval of the Board of Trade. Some of the Acts specify the maximum weight of vehicles loaded, and others the minimum width of tyres and diameter of wheels. I am of opinion that these two points are well covered by the general provision, and I think any arbitrary stipulations as to weight, tyres, and wheels should be avoided.

*Carriage of Parcels, Goods, Animals, and Minerals.*—By reference to the analysis of the various private Acts you will see that only the Brighton and Stockport Corporations have powers to transport goods and merchandise. Leeds, Halifax, and Ramsbottom have restricted powers, whilst in other cases parcels not exceeding 56 lb. in weight may be carried. It does seem strange that enterprise should be hampered in this manner, because, as a general thing, railless systems will penetrate into districts almost void of transport facilities, and the power to convey the village tradesmen's supplies, and to use the vehicles to the fullest advantage, may make all the difference between a paying and a non-paying proposition.

I have a case in mind where a railless line is contemplated to a village 4½ miles from any railway station, and where it would be possible for a good remunerative goods traffic to be handled. The goods are of a light nature, and the weight of the vehicle loaded need certainly not exceed five tons. There is sufficient volume of this traffic to justify the running of suitable vehicles, yet I am afraid, Parliament, following the general precedents, would not sanction these powers.

Railless traction provides such a cheap and convenient means of making connections to manufacturing premises and to railway goods yards that the objections some of us have been fighting for years seem likely to be overcome. On interurban lines, particularly where passenger traffic is so light that full attention can be given to the development of goods traffic, we have striven to create such a traffic, but have failed simply because merchants and manufacturers were not willing either to pay the cost of putting in junctions to their premises or to enter into any minimum tonnage agreement over a term of years. The cost of running a railless trolley circuit a matter of 50 or 100 yards is a very different proposition, and there would appear to be some hope of building up a business with satisfaction and gain to manufacturers and the operating company.

The old bogey "competition" is responsible for these irritating restrictions, and our friends the railway companies will wake up too late to recognise that they have driven away traffic they will never regain. The cry to-day is for speed and for immediate delivery of goods, and manufacturers are fast finding out that motor vehicles are quicker than the railway goods service, and daily we see more and more motor vehicles on the roads engaged in transporting goods and materials direct from manufacturer to manufacturer or to merchant. The delay in delivery occurs between the railway goods yards and manufacturers' premises, and if the railway companies would eliminate the jealousy which appears to be responsible for their policy at present, and give facilities to companies and corporations to deal with goods between the goods yards and the mills, it is probable that the railways would keep the traffic they have, and perhaps regain some of that they have already lost.

*Use of Trolley Vehicles for Sanitary Purposes.*—The local authorities of Bradford, Aberdare, Hove, Ramsbottom, and Chesterfield are authorised to use trolley vehicles for the conveyance of sanitary refuse, road metals, and materials required for the works of the authority, and in the case of Chesterfield it is provided that the weight of the vehicles loaded

Digitized by Google

shall not exceed five tons. I am not sure that this will be of any great benefit to the authorities concerned, and if powers to convey goods and minerals were included in all Acts, this provision would not be necessary.

*Fares.*—There is nothing of interest to this Congress regarding ordinary fares and cheap fares for working classes, and as Dundee is quite exceptional, the only company that is not bound to run a service of workmen's cars or to charge workmen's fares is the Brighton Company.

*New Routes.*—It seems to be usual for the Board of Trade to take powers to make Provisional Orders authorising the use of trolley vehicles upon any other routes within the local authorities' area when once railless powers have been obtained, but this statement does not, of course, apply to the three companies that have obtained Parliamentary sanction. No provision for extension has been made in the cases of the Brighton Company and the Rhondda Company, but the Board of Trade may authorise the use of trolley vehicles upon other routes in the Ormesby Company's area with the consent of the County Council, and in the case of Halifax Corporation the Board of Trade may authorise other routes outside the area of the Corporation with the consent of the district local authority and the road authority. This is a valuable concession, and should be incorporated in all future Acts.

*Conversion of Trolley System to Tramways.*—As railless cars will be operated in many cases from the termini of existing tramways to adjacent villages with a view to testing the traffic possibilities of the routes, it would seem reasonable that the owning authority should have the power to put down a tramway if the traffic was found to warrant the expenditure. This power has been obtained by the Ramsbottom Urban District Council, but I am informed that the Council had powers to construct tramways before applying for railless powers, so the concession to convert the trolley system into tramways by laying down rails, etc., is not quite what it seems. I suppose it would not be possible to obtain Parliamentary powers to convert a trolley system into tramways at the same time and in the same Act.

*Through Running and Interchange of Traffic.*—I see no reason why powers to enter into working agreements with adjacent owners for the purposes of through running and interchange of traffic should not be obtained, and it is strange that the Stockport Corporation is the only authority who may make any arrangements of this kind by virtue of their railless Act. The Corporations of Bradford and Chesterfield have powers under their Tramways Acts, which are incorporated in the railless Acts, but in all other cases no provision has been made, or restricted powers only have granted.

*Trailer Cars.*—Evidently the promoters of railless traction Acts are not contemplating the use of trailer cars, because in most cases no provision is made, and in the Acts of Rotherham and Chesterfield trailers are expressly prohibited. The Ormesby Company and the Rhondda Company may use trailers by first obtaining the consent of the Board of Trade, but Keighley must, in addition to this, obtain the consent of the County Council.

*Road Widenings.*—Various road widenings are stipulated, and the cost is apportioned between the road authorities and the operators. In most cases the road widenings appear to be reasonable, but the Rotherham Corporation is required to pay three-fourths of the cost, which is certainly not equitable or reasonable. Aberdare is called upon to pay half the cost of widenings; Keighley, Chesterfield and Rhondda one-third the cost; whilst the Sheffield Corporation appears to have to pay the whole of the cost, but is not required to purchase any land, and is not obliged to do any widening beyond throwing the roadside waste into the carriageway. The Ormesby Company is not required to pay any of the cost of road widenings, although it is stipulated that a certain route shall not be used until the widenings have been carried out by the County Council.

*Paving at Termini.*—This clause is peculiar to Rotherham, and whilst it may be desirable for the termini of railless routes to be paved, still I think the road authority should be willing to pay a substantial proportion of the cost.

*Improvement of Road Surfaces.*—In only two cases, those of Aberdare and Ramsbottom, is there any provision for the improvement of road surfaces. The Aberdare Council is required to pay half the cost of the necessary surfacing, and the Ramsbottom Council one-fourth of the cost of laying tar macadam on proper foundations on the trackless trolley routes.

*Road Maintenance.*—This is a point which will determine the popularity or otherwise of railless systems. We cannot admit for a moment that railless systems should be singled out from all other forms of road traffic for special road tax, and until all other forms of mechanical transport are by general legislation required to pay a reasonable portion of the cost of maintaining the roads, we strongly object to this burden being put upon railless traction.

The Rotherham Corporation led the way in this matter by agreeing with the County Council and the Rotherham Rural District Council to pay the sum of three-eighths of a penny per car-mile run, or a limited sum per annum, whichever might prove to be the greater, but the liability does not stop there, because if this payment proves inadequate to recoup the County Council for the extra expenses incurred by them, the Corporation is required to pay the additional sum. This additional sum is to be arrived at by agreement, or failing agreement by arbitration.

A similar clause is incorporated in the Acts of the Brighton Company and the Chesterfield Corporation, whilst Sheffield and Keighley are practically identical, and in both these cases the road authority may recover from the Corporations the cost of the extra expense incurred by reason of extraordinary traffic. The Ramsbottom clause is practically the same, except that the Ramsbottom Council will not pay the County Council, but will have the amount deducted from the road grant.

From the point of view of the investor in railless traction schemes the clause inserted in the bill of the Rhondda Company is the only practicable one out of the many inserted in railless traction Acts. In the Rhondda clause the liability is limited to three-eighths of a penny per car-mile, and this being the case estimates can be made with some certainty as to the cost of operating trolley cars, but where the liability is unascertained, and is quite indefinite, it would be quite hopeless to expect any investor to provide money for the construction of such systems, and if we are compelled to contribute to road maintenance before any general legislation is passed, the Rhondda clause is the only acceptable one.

*Railway Bridges and Approaches.*—The protective clauses obtained by the various railway companies seem to have extended in scope since the first few railless traction Acts were promoted. In the Halifax Act the words "use the trolley vehicles so as not to injuriously affect any bridge or bridge approach" were first inserted, and the same words have been incorporated in the Acts of the Hove and Brighton Corporations. No objections can be raised to the usual protective clause as to construction and user of works on railway bridges and approaches, but I think a strong stand should be made against the insertion of the words "use of trolley vehicles." Railway companies are required to erect and maintain bridges and bridge approaches to carry all road traffic, and I do not see that they are entitled to any special protection against the owners and operators of trolley vehicles.

*County and Main Road Bridges.*—The protective clauses of the County Council inserted in the Rotherham and Sheffield Acts are objectionable, because such clauses provide that any injury or damage caused to county or main road bridges by the operation of trolley vehicles must be made good at the cost of the operators. The same arguments apply to county bridges as to railway bridges, and it will quickly become the fashion to attribute all damage to bridges however caused to trolley vehicles, and the fact that motor traffic of all descriptions is growing by leaps and bounds and using the bridges, will be entirely ignored.

*Gas Companies' Protective Clauses.*—These clauses come from the South, and we can well do without them. I imagine it would be extremely difficult for the gas companies to prove that damage to their mains and apparatus had been caused by reason of the running of trolley vehicles, but I think the clauses as they stand are unreasonable and unfair, because no account is taken of other road traffic which, by reason of weight and speed, is calculated to do far more damage than trolley vehicles can possibly do. The Ormesby clause is also objectionable, and the gas company has even gone further in this instance, and is entitled to recover damages for interference with the supply of gas.

*Damage to Drains.*—A clause making the company liable for damage to drains and sewers by reason of the running of trolley vehicles is peculiar to Ormesby, and I hope and trust that this will not spread to other railless traction Acts. The same arguments apply in all these cases, that the railless traction company is not the only user, and their vehicles are not so severe on the roads as other forms of traction, and certainly liability which does not extend to other vehicles should not apply to trolley cars.

*Removal of Snow.*—This clause, which is inserted in a good many Light Railway Orders and Tramway Acts, has been incorporated in the Railless Traction Acts of Halifax Corporation, Ormesby and Rhondda Companies, and the Brighton Corporation. It is honoured more in the breach than the observance, and throws responsibility upon operators that should be borne by the local authorities. Like tramways and light railways, railless traction schemes will be rateable and therefore contribute to the cleansing and scavenging of roads. Only when the local authorities lamentably fail in the execution of their ordinary duties is it necessary for the traction companies to step in and remove snow so that they may continue their business, but to require the traction company to perform something which is obviously the duty of the local authority—in addition to clearing the path for its own vehicles and for other road users—is putting something upon them that ought not to be borne without strong remonstrance. A clause of this description is inserted in one Act, and quickly is regarded as a model clause to be inserted in all simply because vigorous objection is not made. I hope that all promoters of railless schemes will, in future, see that this clause is not embodied in their bill.

*Advertisements on Cars and Poles.*—The question of advertising on cars and poles is not a very important one, and it appears to be the general practice in railless Acts to allow advertisements on cars, but not on poles or the electrical equipment.

*Competition.*—No attempt has been made in any of the railless traction Acts to prevent competition, except in the case of the

Digitized by Google

Brighton Corporation, where the local omnibus company is prohibited plying for hire in any street in which trolley vehicles are run, whilst the railway companies have obtained a protective clause in the Keighley Act which prevents the Keighley Corporation entering into any running powers agreement with neighbouring authorities so that they may run their cars in competition with the railways. I think the Brighton example might be followed with advantage and extended to all routes on which trolley cars are installed and a satisfactory service given.

*Purchase Clause.*—In the Keighley Act the neighbouring authorities are empowered to purchase that portion of the railless system in their districts at the end of 21 years, and in the Chesterfield Act, section 43 of the Tramways Act, 1870, respecting purchase of undertaking by local authorities, is incorporated.

*Accounts.*—As stated in the analysis of the various Acts, all local authorities are required to keep the accounts of railless schemes quite separate from either tramway accounts or other accounts of the authorities, and where payment has to be made for road maintenance on a car-mileage basis, proper mileage statements of trolley vehicles must be kept.

*Periods Allowed for Repayment of Borrowed Moneys.*—The table at the end of the analysis shows the periods allowed by the various Acts for the repayment of loans, and I do not think any criticism of these figures is necessary.

The author next set out in full the following railless trolley Acts of Parliament: Dundee (1907), Leeds (1910), and Bradford (1910) Corporations; Chiswick Urban Council (1911); Rotherham (1911), Halifax (1911), Northampton (1911) Corporations; Aberdare Urban Council (1911), Brighton, Hove, and District (1911) (Brighton, Hove, and Preston United Omnibus Company); Hove (1912), Brighton (1912), Sheffield (1912), Keighley (1912) Corporations; North Ormesby, South Bank, Normanby, and Grangetown (1912); Stockport Corporation (1912); Ramsbottom Urban Council (1912); Chesterfield Corporation (1913); Rhondda Tramways (Railless Traction) (1913).

## ANALYSIS OF THE PRIVATE ACTS.

### ROUTE MILEAGE, PROGRESS OF WORKS, NUMBER AND DESCRIPTION OF CARS IN USE.

DUNDEE.—Route 1¼ miles. Opened for traffic September 4, 1912. Two single-deck cars seating 28 passengers.

LEEDS.—Route 4¼ miles. Opened for traffic June 20, 1911. Four single-deck cars seating 28 passengers.

BRADFORD.—Route 1¼ miles. Opened for traffic June 20, 1911. Two single-deck cars seating 28 passengers.

CHISWICK.—Authorised route 2¼ miles. Not constructed.

ROTHERHAM.—Authorised route 9 miles 3 furlongs 0·05 chains. Constructed 4 miles 6 furlongs. Opened for traffic October 3, 1912. Three single-deck cars seating 28 passengers.

HALIFAX.—Not constructed. Authorised route 7 furlongs.

NORTHAMPTON.—Authorised route approximately 1½ miles. Not constructed.

ABERDARE.—Authorised route 3 miles 4 furlongs 2·9 chains. Not constructed.

BRIGHTON COMPANY. Authorised route 2½ miles. Not constructed.

HOVE.—Authorised routes 8 miles 2 furlongs 9·33 chains. Not constructed. Thirty trolley vehicles provided in Act.

BRIGHTON CORPORATION.—Authorised routes 6 miles 5 furlongs 7·40 chains. Not constructed.

SHEFFIELD.—Authorised routes 8 miles 1 furlong 6·70 chains. Not constructed.

ORMESBY.—Authorised routes 5 miles 5 furlongs 1·6 chains. Not constructed.

STOCKPORT.—Authorised routes 1 mile 6 furlongs 0 chains. All within the borough. Constructed 1 mile 6 furlongs 0 chains. Opened for traffic March 10, 1913. Three single-deck cars seating 28 passengers.

RAMSBOTTOM.—Authorised routes 3 miles 3 furlongs 6 5 chains. All within the district. Partially constructed, 2 miles. Six single-deck cars seating 28 passengers. Opening fixed for May 31, 1913, but since postponed.

CHESTERFIELD.—Authorised routes 16 miles 4 furlongs 0 chains. Not constructed.

RHONDDA.—Authorised routes 4 miles 6 furlongs 2·7 chains. Not constructed.

### TIME ALLOWED BY ACTS FOR COMPLETION OF WORKS.

ROTHERHAM.—Two years from January 1, 1912, as regards routes 2 and 3. The Board of Trade have power to decide.

ABERDARE.—Within five years.

BRIGHTON COMPANY.—Within two years of the passing of the Act.

HOVE.—Two years for through routes, and five years from passing of Act for the remainder.

BRIGHTON CORPORATION.—As regards the Brighton through routes within two years. System to be agreed between Brighton and Hove. Remainder within five years from the passing of Act.

KEIGHLEY.—No time stated as regards works in borough. Four years in the districts of Oakworth, Haworth, Oxenhope, and the rural districts of Keighley and Skipton.

ORMESBY.—Four years from passing of Act.

STOCKPORT.—Five years from the passing of Act.

RAMSBOTTOM.—Five years from the passing of the Act.

No time stated in the other Acts.

### FORM, CONSTRUCTION, AND DIMENSIONS OF VEHICLES.

There is a common clause in almost all of the Acts that the form, construction, and dimensions of trolley vehicles shall be as the Board of Trade may approve. The same condition also applies to the electrical equipment. In some cases the maximum weight of loaded vehicles is stipulated, so I have prepared the following table:

LEEDS.—Not to exceed 5 tons loaded.

BRADFORD.—Not to exceed 5 tons loaded.

CHISWICK.—To the approval of the Board of Trade.

ROTHERHAM.—Not to exceed 5 tons loaded.

HALIFAX.—Not to exceed 5 tons loaded.

NORTHAMPTON.—Not to exceed 5 tons loaded.

ABERDARE.—Not to exceed 5 tons loaded.

BRIGHTON COMPANY.—Not to exceed 5 tons, or 7 tons 18 cwts. loaded.

HOVE.—To the approval of the Board of Trade.

BRIGHTON CORPORATION.—To the approval of the Board of Trade.

SHEFFIELD.—To the approval of the Board of Trade.

KEIGHLEY.—Not to exceed 5 tons loaded.

ORMESBY.—To the approval of the Board of Trade.

STOCKPORT.—To the approval of the Board of Trade.

RAMSBOTTOM.—Not to exceed 5 tons loaded.

CHESTERFIELD.—To the approval of the Board of Trade.

RHONDDA.—To the approval of the Board of Trade.

### DIAMETER OF WHEELS AND WIDTH OF TYRES.

In some cases minimum dimensions are specified

ROTHERHAM.—The width of tyres on the back or driving wheels shall not be less than 6 inches, and the diameter of such wheels shall not be less than 2 ft. 6 in. The tyres to be of rubber or other substance to be agreed between the County Council and the Corporation.

BRIGHTON COMPANY.—Tyres on back wheels to be not less than 8 in. wide and 3 ft. in diameter. Tyres to be of rubber or some other substance approved by the County Council.

ORMESBY.—Width of tyres on back wheels to be not less than 6 in. and the diameter of wheels not less than 2 ft. 6 in. The tyres to be of rubber or some other substance as may be agreed between the County Council and the company.

RAMSBOTTOM.—Tyres on back wheels to be not less than 8 in. in width, and diameter of back wheels to be not less than 3 ft. Tyres to be of rubber or some other substance approved by the County Council. No provision in the other Acts.

### CARRIAGE OF PARCELS, GOODS, MINERALS, ANIMALS, ETC.

DUNDEE.—Same as on tramways.

LEEDS.—Parcels not exceeding 56 lb. in weight may be carried. Trolley vehicles not to be used for the conveyance of goods and minerals, except such traffic as arises in and is destined for places within the city.

BRADFORD.—The Corporation cannot carry minerals or merchandise except their own materials, stores, town's refuse, and manure, but may convey parcels not exceeding 56 lb. in weight.

CHISWICK.—Carriage of parcels up to 56 lb. in weight only permitted.

ROTHERHAM.—Carriage of parcels, goods, and minerals prohibited with the exception of passengers' luggage and small parcels.

HALIFAX.—By section 39 of Act 1902 the Corporation may carry minerals and merchandise between any point on the system and the railway stations by agreement.

NORTHAMPTON.—Carriage of goods, animals, and minerals prohibited except passengers' luggage and small parcels.

ABERDARE.—Goods, etc., prohibited. Parcels not exceeding 56 lb. in weight may be carried.

BRIGHTON COMPANY.—Personal luggage of passengers not exceeding 28 lb. in weight only allowed.

HOVE.—No provision.

BRIGHTON CORPORATION.—By section 21 of the Act 1900 the Corporation may carry any goods, minerals, etc.

SHEFFIELD.—Passengers' luggage and small parcels only allowed.

KEIGHLEY.—Parcels up to 56 lb. in weight allowed.

ORMESBY.—Only parcels not exceeding 56 lb. in weight permitted.

STOCKPORT.—By section 22 of Act 1900 the Corporation may carry goods, minerals, etc.

RAMSBOTTOM.—Passengers' luggage and parcels not exceeding 56 lb. in weight may be carried, and also goods and minerals arising in and destined for places within the district.

CHESTERFIELD.—Prohibited, except small parcels.

RHONDDA.—Prohibited, except small parcels.

Digitized by Google

**USE OF TROLLEY VEHICLES FOR SANITARY PURPOSES, ETC.**

BRADFORD.—Trolley vehicles may be used for conveyance of sanitary refuse, road metals, and materials of the Corporation.

ABERDARE.—Council empowered to use railless route for removal of refuse and for materials and goods for the use of the Council.

BRIGHTON COMPANY.—No provision.

HOVE.—Corporation may use trolley vehicles for sanitary purposes within the borough, or for the conveyance of road metal or other materials required for the works of the Corporation.

RAMSBOTTOM.—Trolley vehicles may be used for the conveyance of scavenging stuffs, road metals, and other materials required for the works of the Council.

CHESTERFIELD.—Trolley vehicles may be used for conveyance of scavenging stuffs, road metal, or other material required for the works of the Corporation, but the weight of any vehicle with its load shall not exceed five tons.

No provision in the other Acts.

**FARES.**

In all cases, with the exception of the Brighton company, the Hove Corporation, the Brighton Corporation, and the North Ormesby company, the maximum fare chargeable is 1d. per mile or fraction of a mile, the minimum charge being 1d.

The four exceptions named may charge a minimum fare of 2d.

**WORKMEN'S FARES.**

In all cases provision is made for workmen's fares at the rate of ½d. per mile or fraction of a mile, with a minimum fare of 1d., with the exception of the Brighton company.

**WORKMEN'S CARS.**

The usual model clause is embodied in most of the Acts, but no provision seems to have been made in the case of Dundee and the Brighton company.

**NEW ROUTES.**

DUNDEE.—Power to run over any road or street within the borough.

LEEDS.—Board of Trade empowered to make Provisional Order authorising the use of trolley vehicles upon any other routes *within the city*. Trolley vehicles may be authorised by any Provisional Order under the Tramways Act, 1870, and may be used in lieu of tramways or pending construction thereof.

BRADFORD.—Board of Trade empowered to make Provisional Order authorising the use of trolley vehicles upon any other routes *within the city*. Any Provisional Order under the Tramways Act, 1870, authorising the construction of tramways in the city may authorise the use of trolley vehicles in lieu of or pending construction of tramways.

CHISWICK.—Board of Trade empowered to make Provisional Order authorising the use of trolley vehicles upon any other routes *within the district*. Any Provisional Order under the Tramways Act, 1870, authorising the construction of tramways may authorise the Council to use trolley vehicles in lieu of or pending construction of tramways.

ROTHERHAM.—Board of Trade empowered to make Provisional Order authorising the use of trolley vehicles upon any roads *within the borough*. Any Provisional Order under the Tramways Act, 1870, may authorise use of trolley vehicles in lieu of and pending construction of tramways.

HALIFAX.—Board of Trade empowered to make Provisional Order authorising the use of trolley vehicles upon any other route within the borough. Any Provisional Order obtained under the Tramways Act, 1870, authorising construction of tramways in the borough may authorise the use of trolley vehicles upon any route in lieu of and pending construction of tramways.

NORTHAMPTON.—Board of Trade empowered to make Provisional Order authorising the use of trolley vehicles upon any other routes within the borough. Trolley vehicles may be authorised by any Provisional Order under the Tramways Act, 1870, and may be used in lieu of and pending construction of tramways.

ABERDARE.—Board of Trade empowered to make Provisional Order authorising the use of trolley vehicles upon any other routes within the Council's district. Trolley vehicles may be authorised by any Provisional Order under the Tramways Act, 1870, and may be used in lieu of and pending construction of tramways.

BRIGHTON COMPANY.—No provision.

HOVE.—Board of Trade empowered to make Provisional Order authorising the use of trolley vehicles upon any other routes, but the Board of Trade shall not make Provisional Order for any route outside the borough without the consent of the district local authority and the road authority. Any Provisional Order obtained under the Tramways Act, 1870, may authorise the use of trolley vehicles in lieu of and pending construction of tramways.

BRIGHTON CORPORATION.—Board of Trade empowered to make Provisional Order authorising the use of trolley vehicles upon any other routes, but the Board of Trade shall not make a Provisional Order without the consent of the local authority of the district in which the route is situate and of the road authority.

SHEFFIELD.—Board of Trade empowered to authorise the use of trolley vehicles upon any other routes within the city. Any Provisional Order obtained under the Tramways Act, 1870, authorising the construction of tramways in the city may authorise the use of trolley vehicles upon any routes in lieu of or pending construction of tramways.

KEIGHLEY.—Board of Trade empowered to authorise the use of trolley vehicles upon any other routes within the borough. Any Provisional Order obtained under the Tramways Act, 1870, authorising the construction of tramways in the borough may authorise the use of trolley vehicles in lieu of or pending construction of tramways.

ORMESBY.—Board of Trade empowered to make Provisional Order authorising the use of trolley vehicles upon any other routes, but the Board of Trade shall not make a Provisional Order relating to any county main road without the consent of the County Council of the riding. Another section provides that for the protection of the Imperial Tramways Company, Limited, no Provisional Order shall be authorised in the municipal boroughs of Middlesbrough, Thornaby-on-Tees, or Stockton-on-Tees, or in the parishes of Linthorpe and Norton. A further section provides that for the protection of the North Eastern Railway Company, the Ormesby company shall not make an application to the Board of Trade for a Provisional Order to authorise the placing, erection, or laying down of any trolley vehicle equipment along any route not within the urban districts of South Bank in Normanby or Eston as existing at the passing of the Act, nor within so much of the urban district of Ormesby as is within the parliamentary borough of Middlesbrough as so existing.

STOCKPORT.—Board of Trade empowered to make Provisional Order authorising the use of trolley vehicles upon any other roads within the borough. Any Provisional Order under the Tramways Act, 1870, may authorise the use of trolley vehicles in lieu of and pending construction of tramways.

RAMSBOTTOM.—Board of Trade empowered to make Provisional Order authorising the use of trolley vehicles upon any other routes within the district. Any Provisional Order under the Tramways Act, 1870, may authorise the use of trolley cars in lieu of and pending construction of tramways.

CHESTERFIELD.—Board of Trade empowered to make Provisional Order authorising the use of trolley vehicles upon any other road within the borough. Any Provisional Order obtained by the Corporation under the Tramways Act, 1870, may authorise the use of trolley vehicles in lieu of and pending construction of tramways.

RHONDDA.—No provision.

**CONVERSION OF TROLLEY SYSTEM TO TRAMWAYS.**

RAMSBOTTOM.—Council empowered to convert trolley system into tramways by laying down rails, etc., and after conversion the Order of 1903 obtained by the Council to apply to the tramways resulting from this conversion.

**THROUGH RUNNING AND INTERCHANGE OF TRAFFIC.**

BRADFORD.—Corporation have power to arrange.

CHISWICK.—Council empowered to make working agreement and interchange traffic with the London United Tramways, Limited.

HOVE.—Special provision for interchange of traffic between the Brighton Corporation and Hove Corporation, and general powers to arrange through running with any other owners.

BRIGHTON CORPORATION.—Authority to make agreements for running powers with the Hove Corporation and any other local authority with the approval of the Board of Trade.

KEIGHLEY.—Trolley vehicles not to be used as part of a through route to and from any place in competition with the Midland or Great Northern Railways.

STOCKPORT.—Corporation may make agreements for through running and joint working and may enter into agreement with the Manchester Corporation to use certain tramway wires.

No provision in the other Acts.

**TRAILER CARS.**

KEIGHLEY.—May not be used without the consent of the Board of Trade and without the consent of the County Council.

ORMESBY.—Board of Trade's consent necessary.

CHESTERFIELD.—Prohibited.

RHONDDA.—Not to be used without the consent of the Board of Trade.

No provision in the other Acts.

**ROAD WIDENINGS.**

ROTHERHAM.—Main roads to be widened by the Corporation to a width of not less than 27 ft. when required by the County Council, three-fourths of the cost to be borne by the Corporation and one-fourth by the County Council. A footpath not exceeding 6 ft. to be provided by the Corporation to the County Council's requirements. It is provided that where at any place the acquisition of any dwelling-house or permanent building used for industrial or business purposes is necessary for the execution of any such widening, or if the widening involves the disturbance, alteration, or interference with any railway line, or railway or other bridge, the Corporation shall not be required to widen the said carriageway to any greater extent than can be effected without such acquisition or interference.

Digitized by Google

ABERDARE.—The Council to pay the County Council one-half the cost of executing specified works for road widening and improvements.

SHEFFIELD.—Routes 3, 4, and 5 not to be opened until required widenings have been made to the satisfaction of the Board of Trade. The Sheffield and Glossop main road in the rural district of Wrotley to be widened if so required by the County Council before trolley vehicles are run. The carriageway not to be less than 27 ft., with footpath not exceeding 6 ft. The roadside waste may be utilised, and the Corporation is not required to comply with the obligations of this section to any greater extent than practicable by using the roadside waste.

KEIGHLEY.—The Corporation is prohibited running trolley vehicles on any county or district road unless the carriageway is 15 ft. in width. In case of a district road where the carriageway is less than 17 ft. in width, the road authority may determine that the road shall be widened so as to provide a carriageway not exceeding 17 ft. in width with footpath or footpaths of the same width as the existing footpaths, but the Board of Trade may determine that the widening is unnecessary, and may also decide that the road be widened to between 15 and 17 ft. The Corporation shall contribute one-third of the cost of such widening. In the case of a county road, where the carriageway is less than 20 ft. in width, the road authority may determine that the road shall be widened so as to provide a carriageway not exceeding 20 ft. in width, with footpath or footpaths of the same width as the existing footpaths. The Board of Trade may determine that the widening is unnecessary, or that a width of more than 15 ft. and less than 20 ft. is necessary, in which case the road shall be widened as determined by the Board of Trade. The Corporation to pay the County Council one-third of the cost.

ORMESBY.—Trolley vehicles not to be used on the Stockton and Redcar main road where the road between fences is less than 36 ft. in width until the road is widened to 36 ft., but the necessary widening appears to be at the expense of the County Council.

CHESTERFIELD.—The Corporation is prohibited running trolley vehicles along any road unless there is a carriageway of not less than 17 ft. in width and a footpath of not less than 4 ft. in width. The road authority shall widen the roads so as to provide in the case of a main road a carriageway of 20 ft. in width, and in the case of district road a carriageway of 17 ft. in width, and where there is an existing footpath or footpaths a footpath or footpaths of the same width as now existing, provided that where the existing footpath exceeds 6 ft. in width in the case of a main road or 4 ft. in the case of a district road, the footpaths shall be reduced to such widths. Where there is no footpath the road authority in addition to widening the carriageway shall provide a footpath of not less than 4 ft. in width, but this provision shall not apply in the case of a main road where the carriageway exceeds 24 ft. in width, or a district road where the carriageway exceeds 21 ft. in width, or in the case of a main road with a total width between fences of 27 ft. and a district road of 24 ft. It is also provided that where, for the execution of such widening, the acquisition of a building is necessary or disturbance, alteration, or interference with any railway or bridge is involved, the road authority shall not be required to widen the road to any greater extent than can be effected without such acquisition or disturbance, and the Corporation is not required to contribute to the cost of widening any bridge or to the cost of acquiring any building for the purpose of widening any road. Upon the road authority carrying out any widening the Corporation shall contribute one-third of the cost.

RHONDDA.—The company to pay one-third of the cost of widening the roads so as to provide a carriageway of 17 ft. with a footpath of 4 ft. The Council to carry out the widening, and to adapt the roads for the running of trolley vehicles. The total sum payable by the company not to exceed £1,333.

No provision in the other Acts.

### PAVING AT TERMINI.

The following clause appears in the Rotherham Corporation Act:

ROTHERHAM.—County Council may require at the commencement or terminus of any route that the road shall be paved with granite or other setts to the full width of the carriageway and for a length not exceeding 30 ft.

### IMPROVEMENT OF ROAD SURFACES.

The following clauses appear in the Acts of the Aberdare Urban District Council and the Ramsbottom Urban District Council:

ABERDARE—*Special Provision*.—County Council shall, within two months after the overhead equipment has been erected on railless route No. 3, put the main road into suitable condition, so that the trolley cars may run over the same. The Aberdare Council to pay one-half of the reasonable cost of doing the work.

RAMSBOTTOM.—Before the system is opened for traffic the Urban District Council to replace macadam on routes over which system will run, with tar macadam on proper foundations, to the satisfaction of the county surveyor. One-fourth of the cost to be paid by the Urban District Council.

### ROAD MAINTENANCE.

ROTHERHAM.—The Corporation must pay to the County Council an annual sum equal to ¾d. per mile run by the trolley vehicles over the main roads, or, alternatively, the sum of £150 per annum, whichever may be the greater. If this payment proves inadequate to recoup the County Council for the extra expense incurred by them in maintaining the roads, the Corporation shall pay the additional sum. The sum of £65 per annum has also to be paid to the Rotherham Rural District Council in relation to roads and bridges repairable by the Council, and all protective clauses apply to this Council as if it were the County Council.

BRIGHTON COMPANY.—The company to pay to the County Council a contribution of ½d. per car-mile run by the company's vehicles over the main roads between the eastern boundary of the county borough of Brighton and Rottingdean, or, alternatively, the sum of £120 a year, whichever shall be the greater. It is also provided that if the sum of ½d. per car-mile proves inadequate to recoup the County Council for the extra expense incurred by them, the company shall pay such additional sum as may be agreed.

SHEFFIELD.—The surveyor of the road authority has power to certify that extraordinary expenses have been incurred by reason of damage caused by excessive weight or extraordinary traffic of the trolley vehicles, and the road authority may sue the Corporation for the recovery of additional expenses they have incurred. It is provided that trolley vehicles shall not be deemed to be excessive in weight, and the use thereof shall not be deemed to be extraordinary traffic by reason only of their being trolley vehicles, or of their being authorised by this Act.

KEIGHLEY.—See section 23 of Highways and Locomotive (Amendment) Act, 1878, as amended by section 12 of the Locomotive Act, 1898. It is also provided that the trolley vehicles shall not be deemed to be excessive in weight, and the use thereof extraordinary traffic, by reason only of their being trolley vehicles.

RAMSBOTTOM.—If it is found that the use of trolley cars increases the cost of repair and maintenance of main roads, the increased cost is not to be included in the annual payment which the County Council makes to the Urban District Council in respect of main roads (under section 11 of the Local Government Act, 1889).

CHESTERFIELD.—The Corporation shall pay any extra expenses incurred by the road authority in repairing and maintaining the roads upon which trolley vehicles or motor omnibuses are run, and it is provided that, at the expiration of the first year, the sum to be paid shall be agreed between the Corporation and the road authority (or, failing agreement, by arbitration), and at the expiration of every subsequent period of three years, or any less period that may be agreed, the two authorities shall agree or arbitrate about the extra expense involved in road maintenance and the payment to be made by the Corporation to the road authority.

RHONDDA.—The company to pay one-third of the extra cost incurred by the Council in maintaining the roads by reason of the running of trolley vehicles, but it is provided that the one-third shall not exceed ¾d. per car-mile.

No provision in the other Acts.

### RAILWAY BRIDGES AND APPROACHES.

DUNDEE.—Worked under special Act.

LEEDS.—Protective clause for railway companies as regards construction and user of works. The Corporation to pay the companies the cost of any alteration of bridges by reason of the existence of or user of works or apparatus.

BRADFORD.—Protective clause for railway companies as regards construction and user of works. The Corporation to pay to the companies the cost of any alteration of bridges by reason of the existence or user of works or apparatus.

ROTHERHAM.—There is a protective clause for several railway companies providing that all works authorised by the Act shall be executed so as not to injuriously affect any bridge or approaches, and the Corporation is required to make good any damage. It is also provided that the Corporation shall pay to the companies any additional expense reasonably incurred by them in the maintenance or reconstruction of any bridge or approaches by reason of the existence or user of the works and apparatus.

HALIFAX.—Authorised works to be executed so as not to interfere with the structure of any bridge, approaches, or works, and the Corporation to use the authorised works and also the trolley vehicles so as not to injuriously affect any such bridge, approaches, or works or property of the company, and in the event of any injury being occasioned by the construction, maintenance, user, or removal of the authorised works or the said trolley vehicles upon, across, under, or over the same, the company may make good the injury and may recover from the Corporation the reasonable expense of so doing. It is also provided that if by reason of the construction of the various works over the bridges or other works of the company, or by the user of the authorised works or by the user of trolley vehicles it becomes necessary to strengthen any bridge or other works of the company, the company shall notify the Corporation and execute such works as may be reasonably necessary, the expense of so doing to be repaid to them by the Corporation. The Corporation shall pay to the company any additional expense which the company may reasonably incur in effecting any widening, lengthening, strengthening, reconstructing, altering,

Digitized by Google

or repairing any bridge or in the maintenance of any bridge, approach, or other work of the company by reason of the existence or user of the authorised works, and it is provided that where the necessity for such strengthening, altering, or repairing is due to the construction or user of the authorised works or the user of trolley vehicles the Corporation shall repay to the company the whole cost of the works.

ABERDARE.—The Council required to construct and maintain certain bridges over the Great Western Railway.

HOVE.—Should the use of trolley vehicles or the construction of the overhead equipment render it necessary for the bridges belonging to the London, Brighton, and South Coast Railway to be reconstructed or strengthened the Corporation is required to pay the cost.

BRIGHTON CORPORATION.—The Corporation shall construct, maintain, and use the trolley vehicles and equipment and maintain and use the trolley vehicles so as not to injuriously affect the structure of bridges, and in the event of injury they shall pay the railway company the reasonable expense of making good. Should the construction of equipment for the working of trolley vehicles over the bridges of the London, Brighton, and South Coast Railway Company necessitate the reconstruction or strengthening of the company's bridges, the Corporation shall defray the cost.

KEIGHLEY.—The Corporation to construct, maintain, and use any works authorised by the Act without damaging bridges or approaches, and to pay the cost of making good any damage.

ORMESBY.—Special clause for the erection and maintenance of bridge over the North Eastern Railway.

RAMSBOTTOM.—Should any damage be done to the Lancashire and Yorkshire Railway Company's bridges in construction, maintenance, user, or removal of works or apparatus the railway company may recover from the Council the reasonable expenses incurred in making good.

CHESTERFIELD.—The Corporation shall construct, maintain, and use the works and apparatus on all bridges and bridge approaches belonging to the Great Central Railway Company so as not to injuriously affect any such bridges or approaches, and in the event of any injury being occasioned, the Great Central Company may recover from the Corporation.

No provision in the other Acts.

### COUNTY AND MAIN ROAD BRIDGES.

ROTHERHAM.—Contribution of £400 to be paid by the Corporation provided Canklow bridge is widened or rebuilt by the County Council, and the Corporation is responsible for injury or damage to county bridges.

SHEFFIELD.—Should the use of trolley vehicles injuriously affect any county or main road bridges the Corporation shall restore such bridges to the satisfaction of the County Council.

KEIGHLEY.—The Corporation is not required to contribute to the cost of widening any bridge. There is a protective clause for the County Council making the Corporation responsible for all losses, damages, and expenses occasioned to the County Council, by reason of the execution or failure of any of the works authorised by the Act.

CHESTERFIELD.—The Corporation is not required to contribute to the cost of widening any bridge.

### PROTECTION OF GAS COMPANY.

BRIGHTON COMPANY.—The company shall make good all damage done to apparatus of the gas company, and shall recompense the gas company for any loss or damage which they may sustain by reason of any interference with their apparatus, or by the working of trolley cars, and if the supply of gas is interrupted the company shall compensate the gas company.

HOVE.—The Act does not relieve the Corporation from any liability for damage which the gas company may sustain by reason or in consequence of any injury caused to their apparatus by reason of the working of trolley vehicles.

BRIGHTON CORPORATION.—The Act does not relieve the Corporation from any liability for damage which the gas company may sustain by reason or in consequence of any injury caused to their apparatus by reason of working of trolley vehicles.

ORMESBY.—The company to make full compensation to the gas company for any loss or damage the gas company may sustain by reason of any interference with their mains, pipes, and apparatus, or by reason of the running or working of trolley vehicles, or any omnibuses or vans in connection therewith, and if the supply of gas is interrupted or interfered with the company shall compensate the gas company and indemnify them against all claims and losses, but no claim shall lie unless the pipes and apparatus are at least 18 in. below the surface of the carriageway.

### DAMAGE TO DRAINS, ETC.

ORMESBY.—The company to pay compensation for any damage to sewers or drains by reason of the running of trolley vehicles.

### REMOVAL OF SNOW.

ORMESBY.—The company may remove snow, but is prohibited using salt or other unsuitable material for thawing snow, and the company must not leave snow at the side of the road.

RHONDDA.—The company may remove snow, but is prohibited using salt or other unsuitable material for thawing snow, and the company must not leave snow at the side of the road.

BRIGHTON CORPORATION.—The Corporation may remove snow, but is prohibited using salt or other unsuitable material for thawing snow, and the Corporation must not leave snow at the side of the road.

HALIFAX CORPORATION.—The Corporation may remove snow or other matter impeding the traffic to the side of the road, but so as not to impede or obstruct ordinary traffic. Salt shall not be used for thawing snow, provided that any snow or dirt shall not be allowed to remain at the side of the road, but shall be taken away as soon as reasonably practicable.

### ADVERTISEMENTS ON CARS AND POLES.

The question of advertising is only mentioned in the Acts of the Brighton Company, Brighton Corporation, Keighley, and North Ormesby.

In the case of the Brighton Company, the Brighton Corporation, and the Keighley Corporation, advertisements are prohibited on poles but not on cars, and in the case of North Ormesby, advertisements are not permitted on any trolley vehicular equipment.

### COMPETITION.

The question of competition is only mentinoed in two of the Acts, viz., the Brighton Corporation and the Keighley Corporation. The clauses are as follows:

BRIGHTON CORPORATION.—It is provided that so long as the Corporation shall maintain a service of trolley vehicles in any street in the borough, the omnibus company shall not, without the consent of the Corporation, ply for hire with motor omnibuses along such street.

KEIGHLEY.—Trolley vehicles are not to be used as part of a through route to or from any place in competition with the Midland or Great Northern Railway.

### PURCHASE CLAUSE.

The following clause appears in the Keighley Corporation Act:

KEIGHLEY.—System outside the borough may be purchased after the expiration of 20 years by the Councils concerned on payment of a sum equal to the then value, exclusive of any allowance for past or future profits or compensation.

CHESTERFIELD.—The Act incorporates section 43 of the Tramways Act, 1870, respecting purchase of undertaking by local authorities.

### ACCOUNTS.

There is a provision in all Corporation Acts and Acts granted to local authorities that the accounts of the railless undertaking shall be kept separate from all other accounts, and, to enable the road authorities to ascertain the mileage of trolley vehicles, the Rotherham Corporation and the Brighton Company are required to keep statements showing the mileage run by each trolley vehicle on the main roads.

### REPAYMENT OF LOANS—PERIOD ALLOWED.

The periods for repayment allowed under the various Acts are as follow: Trolley vehicles, 10 years; electrical equipment of line, 20; cost of Act, 5; electricity works, 20; land, 60; land for street improvements, 50; land for depots, etc., 55; depot accommodation, 20; bridges, 50 years.

[The paper concluded with descriptions of the "Cedes-Stoll," "R.E.T.," "Bremen," and "Filovia" systems of railless traction.]

## RAILLESS TROLLEY CARS v. MOTOR OMNIBUSES.

Mr. H. ENGLAND, as an introduction to his paper, read the following: I am afraid my paper as published will be a disappointment to many of the ardent advocates of trolley cars, and also to those who favour motor 'buses and can see no virtue in anything but these. Through a misunderstanding between our worthy and energetic secretary and myself, my paper was first announced with the title "Railless Trolley Cars *versus* Motor 'Buses," and such a title presupposes a comparative statement of the virtues and failings of each method of traction. My intention was not to traverse the ground that has been so well covered by my able colleagues in this and the Municipal Tramways Association, but rather to place before you all the data possible bearing upon railless traction legislation, analyse and allocate it, so that we should have a handy reference to the various private Acts which have already been passed by Parliament, and, at the same time, we should have a comparison which shows the tendency of legislation and the trend of the Board of Trade's requirements.

To this end I have made digests of all the private Acts, ignoring points which are common to all, such as the protective clauses of the Postmaster-General, etc., and have confined my attention to matters interesting to tramway men contemplating railless traction schemes. I am told the members of this Congress expect something more than this, and will not be satisfied without a duel to the death on the respective merits of the two systems. Well, gentlemen, I am quite willing to give you a text on which you can base your criticism, and before I sit down I will try to give enough ammunition to keep you firing this morning.

A brief review of the proceedings of our Association on this subject may not be out of place at this stage. At the Dublin Congress of the Association, held in May, 1910, I presented a paper on "Railless Traction." We had just begun to realise that railless traction was a "live proposition," as our American cousins would say, and also that our Continental neighbours were employing railless trolley cars both for carrying passengers and goods. Much progress has been made since I composed my last paper on this subject, and we can now see six systems of railless cars which are being worked by enterprising Corporations in Great Britain.

At the Swansea Conference last year, Mr. A. H. Pott, chief engineer of the Metropolitan Electric Tramways, Limited, read a paper entitled "The Respective Values of Tramways, Motor 'Buses, and Railless Trolley Cars as Means of Transport." That paper dealt very fully with the subject, and presented the arguments for each method of transport so very clearly, that it is quite unnecessary for me to go over the same ground. The motor 'bus and railless car controversy is practically in the same position to-day as then, and although motor 'buses and trolley cars have been greatly improved in the interval, the broad lines of argument are the same, and whilst I cannot refrain from asking you to express your opinions on the respective merits and drawbacks of the two systems, I must admit that I am, like many of the members of this Congress and tramway managers generally, an inquirer, and thirsting for information. It would be idle to deny that tramway managers are sharply divided in opinion on this subject, but I think we must all admit that each system has merits that fit it more particularly for certain conditions. I hold no brief for railless traction, and I should not entertain for a moment the idea that railless trolley cars are superior to motor 'buses under all conditions, and certainly would not admit the converse. With your permission I will leave this point for a moment, and deal with it later when directing your attention to the operating costs of railless cars given in the supplement to my paper.

I now want to refer to the subject matter of the paper. I have commented upon the various obligations put upon the Corporations and companies who have had the temerity to go to Parliament for permission to serve the public and to seek to supply a means of transport that will undoubtedly be a great and appreciated boon to thousands, who, up to the present time, have had to be satisfied with the humble, slow, but useful, carrier's conveyance, or, at the best, a wagonette service which ran whenever the proprietors felt in the humour to put the horse to this use, instead of the more lucrative manure leading, furniture removing, and similar jobs the poor gee-gee did between its journeys from the market town to the adjacent villages. All of us know that an abortive attempt was made by the Government to pass a Light Railway Bill last year, and this bill included clauses seeking to facilitate the promotion of trackless trolley schemes, and I have dealt fully with this in my paper.

Digitized by Google

In introducing the paper this morning, and inviting you to offer freely criticism on the various points raised, I desire to emphasise the most important clauses of the various private railless Acts. These points are the use of trolley vehicles for transporting goods, minerals, and merchandise; Parliamentary powers to enter into working agreements for through running and interchange of traffic; the powers of the Board of Trade to authorise new routes in the area when once railless powers have been obtained, road widenings, road maintenance; and the protective clauses obtained by the railway companies, gas companies, and local authorities. The most important is undoubtedly the question of road maintenance, and too much stress cannot be put upon this, as it strikes at the very root of railless traction, and further promotions and extensions will be governed largely by the amount of tax which Parliament puts upon the industry for road maintenance purposes. Whether our leanings are to motor 'buses or trolley cars, we shall all agree that a tax which is applicable only to one particular form of mechanical traction is inequitable. It cannot be proved that trolley cars cause more damage to roads than, for instance, motor 'buses or commercial wagons do, and from personal observations of the road surfaces on trolley car routes in Leeds, Bradford, and Rotherham, I have formed the opinion that trolley cars are not severe on roads, and I have seen far more damage done in my own area by motor wagons and traction engines than would be done in a similar period by a regular service of trolley cars. By some means or other all forms of

**Mr. Harry England.**

traction should pay for the roads they use, according to the weight and speed of the vehicle and the mileage run. I am not prepared to say how this can be arrived at, or how an equitable tax can be imposed, and I suppose my motor 'bus friends will say they already pay by means of the petrol tax. This is not so, because the amount realised by the petrol tax is not devoted to road maintenance, but to road improvements, and, even if it were so, the amount charged under this tax is inadequate when viewed in the light of railless traction legislation, and many of our friends who have had road maintenance put upon them by Parliament for trolley cars would be delighted to exchange the petrol tax for the sum they will be called upon to pay. Again, promoters of railless schemes are made responsible for a portion, if not the whole, of the capital cost of road widenings and improvements, so the arguments used by motor 'bus advocates on this question are unsound.

It is difficult to criticise without appearing to be biassed, but I am attempting to put this question as it appears to me, and I cannot refrain from saying that on this point of road maintenance motor 'buses win all along the line. Freed from road widenings, from road maintenance, from local rates, and taxes (except in the district where the depot is situate), the comparative beggarly amount paid by means of the petrol tax is said to be an offset against these advantages.

I am against any road maintenance charges for either motor 'buses or trolley cars until all road users are compelled to pay a fair sum for the use they make of the roads. Roads are costing more to maintain by hundreds of pounds sterling per mile, even where there are no trolley cars or motor 'buses, than they did a few years ago, and to attempt to saddle us with the whole of the extra cost of maintenance is absurd. We shall see a great increase in heavy motor traffic during the next ten years, and road maintenance is bound to grow. No account has been taken of this fact in the various railless traction Acts, and the promoters are saddled in some instances with the whole of the extra cost of upkeep, although they may only be responsible for a small portion.

Whilst speaking on this subject, I take the opportunity of pointing out that none of the railless traction Acts safeguard the promoters in any way. For instance, some of them must pay a minimum sum per car-mile to the road authority, but, on the other hand, the road authority is under no obligation to keep the road in good repair and suitable for trolley car traffic. Perhaps this is an oversight on the part of promoters, and, as one of my friends said when I mentioned the point to him, "It is implied when you pay for a thing that it will be done." My experience of local authorities makes me doubtful, and I certainly should not be content and satisfied to have anything implied. If we are made to pay we should have our money's worth, and any road authority receiving an agreed sum for the extra cost of maintaining roads should be ready to have a clause inserted in the bill ensuring to the operators that they, the road authorities, will do their part in properly maintaining the roads.

The position of the private promoter or limited company desirous of working trolley vehicles is an impossible one if bound to accept similar road maintenance clauses as those in the Acts of Rotherham, the Brighton and Hove Company, Sheffield, Keighley, Ramsbottom, and Chesterfield. In these cases the liability is unascertained and indefinite, and I am afraid it would be quite useless attempting to finance a scheme, however necessary it was, however promising it looked, with this undetermined liability hanging over it. The investor naturally asks for close estimates of income and expenditure, and when one has to admit that under the heading of road maintenance as settled by the clauses of the above Acts one cannot say what the cost will be, the investor is shy and the scheme fails.

As I have said before, it is unjust to put the cost of road maintenance upon either trolley cars or motor 'buses, and allow all other forms of traction to escape, but if Committees are to be dominated by the County Councils Association, and impose these iniquitous burdens, there must be a maximum amount fixed, or the progress of railless schemes will be effectively scotched outside the areas of local authorities, who, of course, may do as they please inside their boundaries. Local authorities contemplating the use of motor 'buses to connect outlying villages will do well to mark the Chesterfield clause. So far as I know, this is the first time Parliament has burdened motor 'buses with the same road maintenance charges as trolley cars, and it is probable that our friends, the road authorities, will urge Committees to insert a similar clause in future Acts. I am afraid time will not allow me to say any more on this question, but I do hope that strenuous fights will be made on any future bills, either for trolley car or motor 'bus powers, against the imposition of road maintenance charges.

I do not propose to say much on the question of road widenings and improvements, because one must be guided by local circumstances, and I can quite understand the promoter of a scheme agreeing to carry out improvements calculated to facilitate the working of his vehicles. Perhaps local authorities are grasping in cases of this sort, and the improvements ought to be made by themselves irrespective of trolley or 'bus traffic, but so long as the amount is strictly reasonable, and the local authority is agreeable to pay a portion of the cost, I should not boggle over this point. Unlike road maintenance, the cost is not a continuing one, and promoters can estimate their liability with some certainty. It has been amply demonstrated that trolley cars and motor 'buses can be safely run on roads wide enough to accommodate ordinary traffic, and often there is no occasion for the widenings insisted upon by the road authorities. Unfortunately, the supreme road authority is, in most cases, the County Council, located miles and miles away from the district interested, and although the Urban and Rural Councils may be strongly in favour of the scheme, the ratepayers clamouring for it, and the comfort and benefits it will bring, still, with the exception of the solitary representative of the district on the County Council, that august body says, "Widen or die." Whether we choose to die in that sense depends upon the extent of the financial burden sought to be put upon us.

The other matters concerning roads are the protective clauses of the railway companies, the gas companies, county and main road bridges, and, in the case of the North Ormesby Company, liability for damage to drains and sewers. In the paper before you I have pointed out that the words "use of trolley vehicles" are, in my opinion, objectionable, and the railway companies are not entitled to any such protection. I take it that the railway companies are compelled to maintain their bridges so that they may be used by all road traffic, and this is another case of attempting to put all the liability for damage to bridges upon one road user. The gas companies in Brighton, Hove, and the North Ormesby areas have obtained

Digitized by Google

protective clauses, and in North Ormesby the Urban District Council has a clause making the company responsible for damage to sewers and drains that are laid 18 in. below the road surface. I cannot for the life of me see how any gas company or any local authority will be able to prove that the gas mains or drains and sewers have been damaged by the reason of the running of trolley vehicles, but my antipathy to such clauses is the opening provided for litigation and expense in defending unjust claims.

It is almost the general regulation that no trolley vehicle must exceed the weight of five tons loaded, and clauses such as those mentioned are ridiculous, when we know that 15-ton road rollers, trolleys conveying steam boilers weighing 27 tons, and heavy loads of all descriptions are pulled over the same roads. The same arguments apply to county and main road bridges, and it is only in the Sheffield and Rotherham Acts that we find the bridge clauses.

My colleague, Mr. Edwardes, dealt with the carriage of goods and merchandise, from a tramway standpoint, in his paper read and discussed yesterday. Every argument he advanced is applicable to railless traction, and because connections can be made to mills, warehouses, works, docks, and railway goods yards, at a very low capital cost, perhaps there is even greater scope for trolley vehicles than for cars running upon rails. I do not understand the attitude of Parliament on this question, and, as I have stated in my paper, I believe the railway companies are pursuing a mistaken policy, and it would be to their interests to encourage and not oppose the transport of goods between their termini and consumers by tramway goods wagons, trolley cars, or indeed any system that will ensure quick and cheap delivery. I am surprised to find the neglect there has been, as disclosed by the various Acts, to obtain powers to enter into agreements for through working and interchange of traffic.

We are all alive to the fact that every village of moderate size must sooner or later be provided with better transport facilities than it enjoys at present, and every promoter, whether municipality or company, should be prepared to make connections with adjacent systems, so that the full benefits of through carriage of passengers can be ensured. It is futile to say there is no need in any particular case for such powers, because none of us can say with certainty what the next few months or years will bring forth, and means of transport may be provided in places which to-day seem somewhat unlikely. I do not wish to labour this point, but the full significance of it was brought home to me only last Thursday when I found that a company and Corporation actually desirous of entering into a running powers agreement could not do so because the Corporation had failed to take Parliamentary powers to make such agreements. This means that a Provisional Order must be promoted, the loss of at least 12 months' time, and the expenditure of a considerable sum of money. The Board of Trade has power, under the Acts obtained by local authorities, to make Provisional Orders authorising the use of trolley vehicles upon any other routes within the area of the authority, but only in the Acts obtained by the Hove Corporation, the Brighton Corporation, and North Ormesby Company, is permission given to the Board of Trade to go further than this and authorise routes outside the boundaries.

The sense of the words used in the Hove and the Brighton Acts is that the Board of Trade may make Provisional Orders authorising the use of trolley vehicles upon any other routes, providing the consent of the district and road authorities is obtained. North Ormesby Company must obtain the consent of the County Council. This is a valuable provision, because the expense of future applications to Parliament may be saved, and I cannot see any reason why similar clauses could not have been embodied in other Acts. In my criticism of the provisions of the various private Acts, I have written a few lines on the snow removal clause, and I draw your attention to this, but I do not think it necessary to add anything to what I have written. Those of you who have done me the honour to read my paper will be acquainted with the other less important points, and any I have failed to emphasise, I hope will be brought out in discussion.

I now ask your indulgence for a few moments to refer to the operating costs of trolley vehicles, as disclosed by the figures supplied to me by the general managers of the Leeds, Bradford, and Rotherham systems, and printed at the end of my paper. The total working expenses in Bradford amount to 6·623d., in Leeds 4·65d., and in Rotherham 6·61d. There is a marked difference between Leeds costs and Bradford and Rotherham, and I think this is accounted for by the fact that Mr. Hamilton has not charged against the railless cars, management, and a proportion of his standing charges. Mr. Hamilton has charged all additional outgoings occasioned by the trolley cars, and it is a matter of opinion whether to those figures should be added an amount to cover the cost of management, which, I may remark, has not been increased in the slightest degree by this service. The interest and sinking fund repayments per car-mile are—Leeds 2·11d., Rotherham 1·20d., and Bradford 2·66d., and the total costs, including depreciation of overhead line on a 20 years' basis and vehicles 10 years, are—Leeds 6·75d., Rotherham 7·81d., Bradford 9·284d. I think it should be clearly understood that the routes in Bradford and Leeds cannot be regarded as having been constructed on a strictly commercial basis. By this I mean that any company expecting a reasonable return on the capital expended would not have entertained the idea of building either of these routes, and this fact not only affects the revenue but also the expenditure. The system in Bradford, 1¼ miles in length, connects two tramway routes in the suburbs, and I must admit that the traffic has exceeded my expectations, but the vehicles cannot be worked to their fullest mileage capacity, the number of car-miles run per annum is small, the consequence being that the working expenses and the capital costs per car-mile are higher than they otherwise would be.

The Leeds system, from the City Square to Farnley, a route of 4¼ miles, serves a population of 1,500 persons, and cannot by any stretch of imagination, be regarded as a promising financial proposition. The greater mileage run by the Leeds cars will obviously affect the cost per car-mile, and this fact should be taken into account when comparing operating costs. The Rotherham scheme is different. This route makes a junction with a tramway terminus, about a mile from the centre of the town, and is 4¾ miles in length, serving an estimated population of 4,000 persons. The earning power of trolley cars can only be judged by the results in Rotherham, and I hope my friends, who are not fully acquainted with local circumstances, will not form an erroneous impression of the revenue to be derived from railless traction. The Rotherham results are highly satisfactory, and, not only so, but the revenue per car-mile of the connecting tramway has increased from 6·485d. to 10·126d. Then considering working expenses, it must not be overlooked that the vehicles in use are more or less experimental. The "niggers" have been found, and during the next few months a car will be in use which will undoubtedly be a great advance on anything now running. I have refrained from comparing the operating costs of motor 'buses and trolley cars, but I guess my friends will rectify this omission. Most of us are concerned with provincial conditions, with hills and indifferent road surfaces, and I trust you will not assail me with figures garnered from the metropolis. You must appreciate the difference between London and its suburbs and the provinces, and we are all aware that motor 'bus results are obtained in London which we could not hope to get in the cold and dreary north. I trust you will not spare me if you find anything in my expressed opinions to criticise, and if I have done something to place the subject of railless traction plainly before you, to throw some light upon the present state of legislation, I shall feel amply repaid for any trouble I have taken.

## DISCUSSION ON MR. ENGLAND'S PAPER.

Alderman W. Ivey (West Ham) complimented the vice-chairman on the very able and impartial way in which he had placed the matter before them. He had provided them not only with one paper but with three. He was glad that Mr. England acknowledged the differences on this subject so far as it applied to the provinces and the metropolitan area. In the metropolis they were troubled with conditions that those in the provinces knew nothing of, except by reading about them. It seemed to him that though they could thank the Government for the Light Railways and Tramways Bill, yet he did not think they could thank them for very much after all, because in two or three instances the difficulties that surrounded them, instead of being more easy to surmount, were greater than before. If Parliament would only treat all that class of vehicles which dealt with passenger traffic alone, not private vehicles, but motor omnibuses, railless trolley cars, and so on, in exactly the same way as they treated the trams, then the greater part of their trouble would disappear. At any rate, that was the way it appeared to them in the metropolis. In London they had to provide a very good permanent way and maintain it for other vehicles to use, but what they most keenly felt was the excessive competition brought about by the motor omnibuses, which greatly affected them as tramway owning authorities in the metropolitan area. Regarding the operating costs of trolley vehicles, as shown by figures supplied to Mr. England by the general managers at Leeds, Bradford, and Rotherham, he did not think it was quite fair that Mr. Hamilton should not have included something for management costs in the Leeds figures. It was unfair to saddle on to a tramway undertaking a large addition of this kind without putting down something for the cost of management. If Mr. Hamilton had to provide a new undertaking in Leeds, with the management entirely apart from the existing tramway, he would have to provide for management costs from beginning to end. Why should a new system escape the whole of the management charges simply because it was an extension to an existing system? He hardly thought this was a fair return, and if they added the management charges he did not think that railless traction presented a position which was very much better than the tramways. While thanking the Government, and also Mr. Arthur Stanley, whom they looked upon as the exponent of the tramways and road transport systems in the House of Commons, they hoped it would be understood that whatever the last bill had done for them, it had not satisfied them, and they were still looking to Parliament to promote a bill in the interests of road traffic for passengers that would bring all undertakings into line and take away many of the disabilities from which they now suffered.

Mr. William Clough (general manager of Bury Corporation Tramways) said there was a stipulation in various Acts that the accounts of

Digitized by Google

the railless undertakings should be kept separate, and he wondered if Mr. England could tell them how Leeds, for instance, had managed to get outside that stipulation. It was only right that they should have these figures made more distinct, because some poor little urban district, basing its expenditure on these figures, might do so with fatal results. He did not propose to deal with the Leeds figures except to compare them with those of Bradford, where a comparison could be made. In the Bradford figures there was an item that was extraordinarily high—the wages of motormen and conductors, 2·836d. per car-mile; and while they were prepared to accept what was said about time lost in lying over, both vehicles made good speed per hour, Bradford 7·56 miles per hour, and Leeds 8 miles. There was also a big difference in the number of units per car-mile used by these vehicles In the case of Bradford it was 1·25 and in the case of Leeds ·87. They were told last year that these trackless cars could be run with 50 per cent. less energy than the tramcars. At Bradford it was certainly not 50 per cent. less. Again, in Leeds the cost of electricity was low—·44d per unit was an extremely low figure, and he thought that without explanation it was rather misleading. If they took Bradford's figures of 6·623d. per car-mile for total working expenses, they must add interest and sinking fund, but they got it in the case of Leeds, and there would not be much difference between one and the other per car-mile as regarded capital expenditure. If they added 2·11d. for interest and sinking fund to the Bradford figure of 6·623d., they got 8·733d., and on to that they had to put road maintenance, which he did not think they could get out of for less than ·375d., which made a total of 9·108d. His point in connection with these figures was that they were part of an existing system, and with a trackless trolley system working in that way, there must be expenses that were not included. He hoped that in twelve months' time he would be able to give them some figures arrived at on a separate basis. The district of Ramsbottom, which was within three miles of his own system, was putting up a trackless trolley scheme, of which he was to have control, and he would endeavour to get out figures as for an entirely separate trackless trolley system.

Mr. C. W. Shepherd (general manager of the Edinburgh and District Tramways Company) agreed with what had been said about the development of districts by the trackless trolley system. It could hardly be called an urban district that was being served at Leeds, although the system went almost into the centre of the city. The earning capacity during the week time was deplorable. From the Monday to the Friday he believed the earnings came out at 2¾d. per mile, and on the Saturday and Sunday went up to as much as 2s. 6d. and 2s. 7d. per car-mile. The only thing the system had developed in Leeds was the value of the public-houses at the terminus. He was told that the value of one place had been increased from about £1,000 to about £6,000. The district tapped by Bradford was the most populous part of the Bradford area, and he could quite understand the paying part of that route Still, he thought motor 'buses would always be more advantageous than trackless trolleys, even in a big system like Leeds or Manchester, when they had to tap these urban districts. Sometimes in catering for heavy traffic the tramway system was taxed to its utmost, and not another vehicle could be put on the line. Motor 'buses could be far better used for that spare traffic, and would be more remunerative than the trackless trolley system, which was practically lying idle and earning no profit for three parts of the week.

Councillor Isherwood (chairman of the Oldham Corporation Tramways Committee) said that they had the question of trackless trolleys under consideration at Oldham for some time, but they had abandoned it in favour of the motor 'buses. They had now got motor 'buses working to residential districts where tram lines were not laid, and also to an out-district of the borough where there had been no property at all. In the first case they were getting a revenue of 13d. per car-mile, and in the other case where property was not built, but where it was now developing very rapidly, they were getting even in that district a 1s. to 13d., which was made up chiefly of traffic at the week-ends. The expense of the motor 'buses had not been very great, and the rateable value of the town was being extended very greatly in the districts where the 'buses are now running. Motor 'buses, in his opinion, had come to stay, and though they had had several complaints from some of the residents about the shaking caused by the 'buses, and the splashing for want of some effectual mudguard, still, when they took all the disadvantages into consideration, instead of removing the motor 'buses, they would be compelled to increase them.

Councillor J. H. Rodgers (chairman, Newcastle Corporation Tramways Committee) said that when he spoke at the Conference at Swansea a year ago, they had just commenced running motor 'buses in Newcastle. They tried the motor 'buses in preference to the trackless trolleys, and they had them still, although he was prepared to grant that in certain places and under certain circumstances the trackless trolley might be an advantage. These 'buses were used simply as a feeder to their tramcars They were handicapped last year because they commenced with only one 'bus. They were running what was an hour's service, taking 20 to 23 minutes on the outward journey and about 20 minutes to come back, which allowed them a lie-over of five or six minutes at each end. As the season went on they got more 'buses, and they had now four. Although they were hindered last year by having only one 'bus, they carried no less than 277,000 people in the twelve months from May to May. Their earnings were 10d. per car-mile, and their expenses were considerably lighter than they expected about 7d. or 8d., which included depreciation that would write off the cost of the 'bus in five years. He thought they had every reason to be satisfied with the working of the motor 'bus in Newcastle. They only ran them from the country districts to the tramway terminus, and then the great majority of the passengers got on the cars for the city and paid an additional fare. They reckoned that £20 a week thus went to the credit of the tramcars and not to the credit of the 'bus—through the transfers taken from the terminus to the city. If they had put down trackless trolleys they would also have had to put down a sub-station, which would have cost about £7,000 or £8,000, and altogether they would have had a capital charge of about £12,000 to work that portion of the district outside Newcastle by trackless trolleys. They had avoided all that. Their 'buses cost the same as the tramcars, £850, but they were saving the cost of the sub-station and the overhead equipment, which was the difference between a profit and a severe loss. If a main road was up by order of the local authorities, the motor 'bus traffic could be diverted along another road until such time as the regular road was repaired. They could not do that with trackless trolleys. The latter went on one route and were tied to that route. Their experience in Newcastle was that motor 'buses were much preferable to trackless trolleys, for their district at any rate.

Mr. R. H. Humphries (chief engineer of the Birmingham and Midland Tramways Joint Committee) said that considerable progress was being made in the black country with the use of motor 'buses as feeders to existing tramways. In his opinion the great advantage that the motor 'bus had over the trolley car was its mobility. It was not always possible to define at the start what would be the best route for these feeders. He mentioned an instance where it had been found that a certain route that had been tried was not the best, and it had been altered, with the result that there had been a wonderful improvement. They could not have done that very well with the railless trolleys, and therein, he thought, lay the salvation of the motor 'bus and the damnation of the trolley car.

Sir Edward White (chairman of the Highways Committee of the London County Council), in referring to the cost of road maintenance, said that the other other day he gave evidence before a Committee of the House of Commons sitting to inquire into the question of London traffic, and he made an alternative suggestion that either motor 'buses should be called upon to pay something towards the maintenance of the roads, which they destroyed much more than did the tramway cars, or that if there was any further taxation put on the public who availed themselves of this means of locomotion, the tramway authorities should be relieved of the cost of maintaining thoroughfares. There was a time in the earlier days when the owners of tramways should be called upon to repair and maintain a certain portion of the road, because the tramway service was then worked by horses, and in consequence a considerable amount of injury was done to the portion of the road over which they ran. To-day, however, the trams did practically no damage to the roadways. If a new tramway undertaking was required, it would only be right that when they laid down the metals and made the road good at the commencement, they should not be called upon later to continue to repair the road. In that respect they might be put on an equal footing with the motor 'bus companies. He was all in favour of a cheap service of locomotion, and he objected to any tax being put on motor 'buses or tramcars, and he would equalise the present condition of things by removing that charge which in London was a very great tax on their undertakings. There would be some difficulty in getting the local authorities to approve of the course he suggested, but if they looked at it fairly they would see that owing to the severe competition of the motor 'buses, there was a good case why the trams should be relieved of that heavy charge. He knew also how difficult it was to get the House of Commons to take that view, but he thought that with a little hammering, they might eventually give way. The cumbrous system that had to be adopted before they could get permission to lay down a tramway ought to be altered. He thought a joint Committee of the two Houses should sit and hear evidence, because practically the same evidence was produced before the two Committees to-day, and it was a duplication of work that might well be avoided, and it would also mean a considerable reduction of expenditure, especially in the case of London. In the provinces, of course, the conditions were different. In London they had to contend with 28 local road authorities, all of whom were anxious to get something out of the tramways. If the tramways authority wanted to open out a new route, and applied to Parliament for sanction, then several local authorities through whose area they wanted to run would oppose the scheme, with a view to to getting something or other in exchange for their sanction, and very frequently the tramways people had to submit to what one member of the House of Commons called "blackmail," though he preferred to call it negotiation. They had to submit to this negotiation, which they considered was very unfair, or otherwise their bill was thrown out. They tried the other day to get the trackless trolley system through a road on which it would be impossible to make

Digitized by Google

the conduit system, from Hackney through Stepney to the Docks. Several local authorities favoured the scheme, but there was one Stepney—that would not have it at any price, and they succeeded in killing the bill, because the consent of the local authorities was required before the matter could be proceeded with. He did not know whether the same thing applied in the provinces, but in London, if the road authority objected, the scheme was vetoed straight away. These things were very unfair indeed, and they needed more freedom in dealing with such matters. The public must be protected, but he did not think these onerous conditions that were placed on the London County Council in providing tramways were at all fair or reasonable. He did not know who could bring the matter up in the House of Commons with any prospects of success under the present conditions, but it would be a step in the direction of Home Rule for London, which he was sure all municipal administrators would heartily welcome.

The Hon. ARTHUR STANLEY moved a hearty vote of thanks to Mr. England for his interesting paper. He thought that if any proof was wanted of the value of these Conferences, they had it that morning, because the discussion was good in two ways. It showed that tramway men throughout the country were fully alive to what might possibly become a serious competition, and the fact that they were alive to it was going to be a help to tramway people instead of a hindrance, and it would draw the attention of those who were not aware of these circumstances to possible competition, and the use they might make of this competition instead of being destroyed by it. He did not propose to discuss the comparative merits of trackless trolleys, motor 'buses, and other forms of traction, but he would like to say a word or two on the general political side of the discussion. As Mr. England had pointed out in his paper, in the Tramways and Light Railways Bill last year, they did do something to the advantage of the tramways and light railways; but owing to what he might call the emendations made to the railless trolley clause, they were obliged to press for the deletion of that clause altogether. It was better to remain as they were rather than get something they did not want. He was coming more and more to the conclusion, which was forced on everyone who studied these matters, that Parliament was the worst body before whom bills for tramways and other forms of traction could come up for sanction. Until they had some radical change in the way the House of Commons Committees did their business, it was possible for almost any obstinate member to make the carrying of a new tramway Act almost an impossibility; at all events, to make it so much more difficult, and so much more expensive, that it gave the promoters reason to wonder whether it was a good thing to bring the bill forward at all. Moreover, they never knew in what mood they might find the House of Commons. They could never be quite certain who was going to attend the Standing Committee. They might pass a bill one day, and not pass it the next, and in these circumstances he thought Parliament was the very worst body that should have to decide upon the promotion of an Act in its early stages. The public had got to be safeguarded, it was true, but that could be perfectly well done when the bill had passed its first stage. He believed himself that the only way of dealing with the problem from the point of view of tramways and trackless cars, motor 'buses, and so on, was that there should be one central road authority in this country. They could go to this central road authority, which would be free from all local jealousies—if they might call them such—and they could ask if they might have a tramway or trackless trolley route, or omnibus route, on some particular road. The central road authority would decide on the general merits of the case, and when that had been done they could look into the local conditions, and see that they all received fair play. As they knew, it would be no very difficult thing to deal with local individual interests after they had once got permission to have a particular form of traction along a particular road. They would also find it very much cheaper.

When the Road Board was first formed, it was largely due to the action of motorists, of whom he was, in a sense, the representative as chairman of the Royal Automobile Club, and he was very anxious to see that Road Board then made into the central authority he had just mentioned. But in this world they had to take what they could get, and they were getting on the whole very much better terms than he expected, because they got the principle established that as far as motor cars were concerned, all the taxation paid by motorists should go directly towards the roads. It was true that it only went towards road improvements and not maintenance, but it was a very great step forward. It did not seem to him to be a very long step forward to say that what applied to motorists should also apply to every section of the road users. He felt very strongly that so far as possible they should get some fair system of taxation of all those who used the roads, and that that taxation should go not only to the improvement of roads but to the maintenance of roads. He did not wish to labour the point, but there was not the smallest doubt that they as tramway men were unfairly taxed. He did not suppose that anyone suffered more than they did in South Lancashire, where they seemed to build their tram tracks simply for the sake of heavy motor lorries that plied between St. Helens and Liverpool. It had been hoped that Parliament would bring in a bill to remedy this state of affairs, but it was not Parliament that should bring this matter forward, but they themselves.

He was rather in a difficulty in the matter, because he had still an active interest in the motor world, and while they, as tramway people, complained that they were unfairly taxed, he had been told not once, but hundreds of times by motorists that by having advocated the petrol tax he had gone far to kill the motor industry of this country. It was good to be optimistic in this matter, and he thought it was not impossible for them to get a fair scheme for the taxation of all those who used the road. He would like it to be the outcome of the Conference that the Executive Committee of the Tramways Association be instructed to go ahead in this matter and confer, if need be, with other bodies. He could answer for it that he would be only too glad to bring in the motoring bodies to confer with the Road Improvement Association, who were a most active and progressive body and had done an immense amount of good to the roads. If they could get forward a conference of that nature to see if they could agree, at all events on some general principle for the guidance of a Central Road Board, he thought the outcome of their present conference in Blackpool would be a very large step towards settling many vexed questions affecting not only tramway people, but all those who used the roads in this country. Mr. England had initiated a discussion which would have far reaching effects. It could not have been done better than by Mr. England, whose support of the Association was absolutely unfailing and unswerving. He knew that Mr. de Turckheim would agree with him that if they lost Mr. England they would very nearly have to shut up shop. (Laughter and applause.)

Mr. ENGLAND said he did not intend to reply at length, though he had come prepared with any amount of literature, expecting to be tackled on the running costs of railless cars and motor 'buses. Some of the figures he had mentioned for Leeds and Bradford had been criticised, but nothing had been said about the cost of running motor 'buses. He had the figures for the cost of running motor 'buses in the provinces, gathered from various systems, so he was prepared for discussion that might have arisen on that point. He had advocated railless cars with the object of promoting discussion, and he was prepared to discuss the capital charges and running costs of both systems, and he could substantiate his argument that it was much cheaper to run railless cars than motor 'buses in provincial towns. Referring to the running costs he had given for trams and railless cars in Leeds and Bradford, Mr. England said he did not think they could criticise the figure for railless cars, because, as he had explained before, there was a lot of lie-over time which could not possibly be utilised. If they increased the mileage run by railless cars by one mile an hour they could make a tremendous difference to the traffic costs. Regarding self-propelled cars, Mr. England said the only place he knew where they were running was Morecambe, and another thing he knew about them was that they vibrated considerably.

He would much rather have motor 'buses than railless trolley cars. He could not see the advantage of putting down a track for self-propelled cars, and for himself, he would not entertain the idea. Referring again to the Leeds figures, Mr. England said that Mr. Hamilton contended he had charged against his railless system every penny that the system had cost, and he had found that other Corporations who were running motor 'buses fell into exactly the same error. But, in fact, it appeared to be the general thing for the manager who adopted either railless cars or motor 'buses not to charge against those systems any proportion of his ordinary standing charges. Perhaps they were wrong, as Alderman Ivey said, but whether they are wrong or not, they wanted to compare likes and not unlikes.

As a tramway man he did not need to employ highly skilled labour in his repair shops, but if he went in for motor 'buses he would want an entirely different class of mechanics who knew all about ignition and carburettors. With the railless system the ordinary rough labourer or handy man in a tramcar depot could do everything that was necessary. Another argument that had been used in favour of motor 'buses was that they could be moved to different roads, but if that argument had been applied and accepted before tram tracks were laid there would have been no tram tracks laid in this country.

---

Mr. A. V. MASON (the general manager of the South Metropolitan Electric Tramways and Lighting Company) then presented his paper on "Standard Rules for Motormen and Conductors."

## RULES AND REGULATIONS FOR TRAMWAY EMPLOYEES.

BY A. V. MASON, M.I.E.E.

*(General Manager, South Metropolitan Electric Tramways and Lighting Company, Limited).*

This can hardly be called a paper in the proper sense of the word, for it is really only an explanation of the rules and regulations which have just been published by this Association. It was felt that some member of the Special Committee might with advantage explain the "whys" and "wherefores" of the rules as they have been presented, and that this should be done before they are made active use of by any tramway undertaking; it was also felt that the Congress afforded an excellent

Digitized by Google

opportunity for doing this, as not only is it an interesting subject for discussion amongst tramway men, but the discussion might be of value to those intending to adopt these rules as a basis.

I would start by saying that during the latter part of 1912 a small sub-committee was formed, consisting of Mr. England as chairman, Mr. Edwardes, Mr. Barber, and myself. We held about a dozen meetings, and it was at the last of these that the suggestion was made that one of the members should read a paper on this subject at our next Congress, and the task fell to me. I mention these details because I feel that at one moment I may be speaking as a representative of the sub-committee, and the next moment in my personal capacity. In the latter case the other members may disclaim responsibility for some of my statements or opinions, and might say I was speaking without their authority, but as long as this is thoroughly understood, I can leave it at that.

The first step taken by the committee was to have a collection made of most of the rules and regulations now in force on the various tramway systems in the United Kingdom. This rough collection was then presented to the sub-committee as a sort of skeleton whereon to base their future operations. This skeleton had not by any means a "bony" appearance, and it was found upon consideration that, speaking generally, the rules were unduly long, in fact suffered somewhat from verbosity; they also often contained explanations tending to confuse, and in many cases there were needless repetition and duplication. After much discussion, the sub-commitee decided that no rule should be included which could not be reasonably enforced, and they were also of opinion that no threats or penalties should be included. All references to inspectors, timekeepers, and linesmen were omitted, as the committee considered that rules to inspectors should be for the private use of each undertaking and not for general publication. In regard to linesmen, it was also felt that no standard rules would apply, as each undertaking would have to be governed by local conditions.

Mr. A. V. Mason.

Having thus eliminated a substantial portion of the original matter, they decided to subdivide the new rules into three sections: (1) Rules applicable to both motormen and conductors. (2) Rules for motormen only. (3) Rules for conductors only. These are preceded by alternate forms of agreement, from which a selection can be made to suit the respective undertakings. The rules are followed by forms of instructions of "How to Deal with Accidents," "Offenders of By-Laws," "Faulty Cars, Overhead," etc. I would now submit the suggested standard form, and trust that members in criticising it will take the foregoing remarks into consideration. I will proceed to deal briefly with the details.

### AGREEMENT FORM.

Some form of agreement, whether a long one embodying many of the rules of the conditions of service, or a short one, I leave to the choice of the members, but some form of signed agreement is necessary in order to comply with the provisions of the Truck Acts. In this connection it may be of interest to our members to refer them to a letter written to the committee by our hon. solicitor, Mr. William Morris. This letter will be found in the appendix [page 36]. It will be noticed, that according to the advice contained in that letter, there should be a *written* agreement with the employee, which the latter should sign in order to make the proposed deductions legal. With reference to Rule 18, the committee deleted the words objected to, viz., "or in case of collision where injury has been done." The original skeleton taken from the various rule books was found to contain much contradictory matter, rules were duplicated, confusing, etc., so that a draft of every possible rule to be made or to be thought of was compiled and then cut out, fought over, separated or combined in the form now presented, with the result that the sub-committee have submitted what they consider may be regarded as a standard form. The rules as submitted are based on the understanding that we are dealing only with the motormen and conductors, or, in other words, with the "platform staff," and that the persons to whom they shall apply are already members of a tramway staff, and not applicants. Here, I might reiterate that the rules are for employees and not for applicants, but I will admit that, before a person can be reasonably asked to sign either the agreement form or the conditions of service, he should have some rough idea of the rules and regulations he agrees to carry out, so that really a standard application form might have been profitably added thereto. In dealing with applicants there seems to be some diversity of opinion. I personally consider that every man taken on as a conductor should eventually qualify as a motorman, and should be prepared to qualify in a given period, or make way for some one who will. Again, for this a height standard is necessary, but this seems to be hard to enforce in some parts of the country. In view of the increase of speeds of all vehicles, motormen should not only pass a medical examination on joining the undertaking, but should also be prepared to be re-examined periodically, especially for eyesight. Some undertakings are not content with taking up references, but ask for monetary deposits and sureties as well; but I do not consider these to be reasonable requests.

### GENERAL RULES.

These rules apply to both conductors and motormen, and I do not know that I have much comment to make thereon. The first dozen or so certainly seem to contradict the committee's assertion that brevity has been aimed at; but as these undoubtedly deal more or less with legal matters, some legal mind has framed them, and the committee therefore, it goes without saying, adopted them nearly as they stood. Many have been added, and they certainly seem to cover most matters, and I submit that they do not contain any conditions which are either unreasonable to ask for, or which the employee cannot reasonably accept. In the matter of discipline it might have been considered advisable to underline certain offences as being liable to instant dismissal, such as issuing tickets fraudulently, insubordination, intoxication, or entering a public-house when on duty; but the committee felt that these matters had better be left, with others not so important, under a general clause at the manager's discretion. In the matter of reports by inspectors, there appear to be various methods of dealing with this matter all over the country, but I think that in each instance, an inspector when reporting any employee for breach of regulation, should inform him of the fact at the moment, or at any rate as soon after as possible if the car passes him. I always insist upon this, and then send the offender a note for a written explanation, which is filed in his record. This saves personal interviews, and a man's record of excuses tells its own story.

### RULES FOR MOTORMEN.

It is assumed that the employee has passed his school and knows not only how to drive the car proficiently, but that he is also acquainted with all the details of the car and its equipment. Nearly all the rule books contained pages of details and diagrams in regard to equipments, controllers, etc., all of which the committee considered to be unnecessary at the present day; not in any spirit of criticism as to the rules themselves, but simply because the industry is now no longer in its infancy, but rather in its adolescence (or "senile decay," *vide* the "Commercial Motor"), and they considered that this information was no longer needed; they therefore omitted as much as possible. On the other hand, the committee in many places came perilously near the border line of technical instruction or school matters, but it was felt that many instructions should be constantly before the employee all through his career, especially as regards brakes, faulty cars, and other matters that would likely to be to the danger of the general public or of the service as a whole. These details will have to be enlarged and added to by undertakings which have special brakes or equipments, intricate cross-overs, routes, or termini. Another matter not touched upon by the committee is the subject of "meters." As far as a general rule is concerned, economy in driving a car must be achieved, and each local undertaking must add its own method of achieving it, as well as other matters of local importance.

### RULES FOR CONDUCTORS.

The same remarks in regard to the school apply in the case of conductors, but the committee felt that in the matter of tickets and cash, more specific instructions should be before the staff at all times. Members must not think for one moment that the committee expect the details as given to be made the general practice all over the country, but they do think that they meet the average conditions, and accordingly each local undertaking should amend the rules whilst retaining the system. An important item under this heading which might be advantageously discussed, even if rather outside the pale of this paper, is the advantage or otherwise of bell punches. I am aware that in some cases as many as 15 to 18 various forms of tickets are in daily use, and it is a questionable point whether or not too much time is not spent by the conductor on way-bills. The public are every day obtaining greater facilities in the shape of through bookings on other lines, to music halls, piers, picture palaces, etc.; and transfer returns make the punch register, to a large extent, useless. It has been claimed by some managers that a good inspector can satisfactorily check a car without the tickets being indentured at intermediate stages.

### SPECIAL FACILITIES.

Standard rules for transfers, returns, workmen's, school children, etc., have not been included. These seem to vary as much in practice as to charges and systems as those in the kindred branch of electric

Digitized by Google

lighting. Looking at the various systems in practice and the absolute lack of uniformity in practice, the committee decided discreetly to leave these subjects alone. I would give a few details, as they would lead to very interesting discussion and, may be, standardisation at some future time. Local conditions, I know, govern most cases, but not to this extent.

### TRANSFERS.

Those in most common use are: (*a*) A transfer ticket which is only given to passengers demanding transfer facilities, an exchange ticket being given on the second car. (*b*) A transfer ticket with over-print letter denoting day of issue, with exchange. (*c*) An ordinary ticket with transfer section. No exchange—the second conductor tearing off and keeping the "ordinary" portion. (*d*) A transfer ticket (which is given with ordinary ticket), clipped denoting day, hour, and minute when issued. (*e*) A transfer ticket built in two halves, with a place for the first conductor to punch a letter denoting the day issued, and the second conductor punches out the hour and tears off the top half to balance the punch register. I will not attempt to discuss the "pros" and "cons," except to mention that all transfers seem fated to create abuse either by conductor or passenger, and all seem to be issued on the understanding that they must be used the same day and at once and are not interchangeable; but the question of trying to prevent abuse means complication of tickets and extra office work, and the cure is often worse than the disease. Systems that have tickets without face value, such as ordinary exchanges, are especially bad and lend themselves to "trafficking" and irregular usage.

### RETURN TICKETS.

The same remarks apply, to a great extent, to these facilities and tickets, and the same difference in practice exists. Returns are doubtless becoming more popular, especially where competition exists, and more "standard" forms should be possible.

### WORKMEN.

Privileges to workmen vary very much according to the district. Practice, however, again varies to a large extent. Many undertakings carry anyone on any car during "workmen's hours," and others again specify that a workman must comply with the meaning of the Act; others carry workmen only on cars marked "workmen." Here local conditions are important, for it is obvious that in manufacturing towns the same rules cannot apply which apply to London suburbs. I once tried an interesting experiment of issuing a weekly ticket at the rate of 10d. per week for 12 rides (2d. ordinary fare), or to and from work once a day. The object was to try to persuade the workmen to ride, wet or fine, and to pay for the tickets on pay day, when they are in possession of cash. The experiment was not successful—curious, for it should appeal—on paper!

### SCHOOL CHILDREN.

The system of carrying children to and from school at reduced rates is becoming more or less universal on many systems. Here we get a weekly ticket at a fixed price—or again a ticket capable of being used for so many days—or the children are simply charged half ordinary fares without special tickets. The system that appears to be most satisfactory is to issue a yearly identification card, which can be obtained at the office or school at a small nominal fee, and which, on production, enables the holder to ride half-price, an ordinary ticket being issued—1d. each way being the lowest fare. Of course it will be argued that this does not cover all conditions; the Board School child generally is well within walking distance and need not be provided for; but without doubt the secondary and private schools bring grist to the mill even at reduced fares, and help to stimulate the wish to ride early and often. This is a lesson well learnt from the tramway aspect.

The age limit of school children varies over the country, and anomalies often arise, as one does not grant these facilities to shop apprentices, shop girls, and pupil school teachers, who do not come under the definition of "workmen," and who are often too late for these facilities; but the electric lighting tariff factor of "expediency" can be brought into play: just as we tramway men often have to pay twice the price for driving our cars that we do for heating our rooms (if we start heating our cars electrically a very curious anomaly will arise), and I do not see why these apprentices should not be included in the reduced fares; the railways now cater for and obtain them.

### TOKENS, DISCOUNT, OR STRIP TICKETS.

These "facility" tickets have not been adopted to any extent in this country, so a standard rule has not been framed. Tokens are doubtless a convenience to tradesmen, and the strip or discount ticket presents fascinations and gives a facility for the granting of rebates for special traffics readily and without having to make sacrifices, simply by the addition of one, two, or more tickets on the strip; but the ease with which conductors can "traffic" in these has been the obstacle to their popularity. In Canada the box collecting system saves this to a large extent, and there the whole population travels by ticket at differential rates not only for workmen, school children, etc, but for different hours. I mention this because I often wonder whether generally we are not too "hide bound" and too fond of playing for safety, afraid of abuse by the public, or trafficking by the conductors; and yet perhaps with a little more elasticity in our ticket system a net increased revenue would be earned. These remarks do not apply so much to the manufacturing districts as to the residential, or where there is competition.

### PARCELS OR PERSONAL LUGGAGE.

This traffic is also subject to great variations. Some undertakings carry all parcels free; some charge 1d., others 2d. for any distance; others again charge the same fare as for passengers. Push-carts are generally carried free, and the push-cart of to-day is becoming a young perambulator. Dogs are also a bone of contention, and the meaning of "personal luggage" varies considerably. Some standard practice is desirable; it is also desirable to issue a special ticket stating that the parcel is carried at the owner's risk (if this can be legally enforced). In my personal opinion I do not see why a passenger should not be charged a nominal sum for every parcel that is carried on either platform, and only such parcels carried free of charge as can be carried on the lap and do not cause inconvenience to other passengers.

### BELL SIGNALS.

A good deal of diversity is shown in practice. Some systems adopt a signal of two bells to start, and of one bell to stop; others reverse the process. Personally, I should have thought it better practice to have one bell to stop and only the professional double ring of the experienced conductor for starting. On my undertaking we have the double bell to stop, owing to through running, and I find that a double-double bell is most useful as a signal for an immediate stop, but not to be mistaken for an emergency one. It is most annoying in the event of a conductor missing a passenger not to be able to stop the car promptly; the motorman very often thinks the ordinary bell denotes the next stopping place.

### THROUGH RUNNING.

In the case of "through running," local conditions again govern matters to a considerable extent, and "through running" arrangements vary to an even greater extent than transfers. At the same time the details are matters governed by policy rather than by discipline.

### TOOLS.

The question of tools should be included in the chapter on motormen, and this also brings out many different practices. Some managers have tools locked up in a glass case; others supply a complete kit of tools, with hammers, jacks, gloves, etc. Personally, I believe the most satisfactory practice is to have a board fitted with a feeder box key, pair of pliers, Stilson wrench, screwdriver, piece of rubber insertion, on a board, and a hand-lamp, fitted with night-light in place of oil (the lamp is hardly ever used, and oil always leaks), which is taken out by the motorman who first takes the car out of the shed; he passes it on to his relief man, who in his turn hands it to the inspector on completion of his duty. All lost tools must be paid for at cost price.

### GENERAL.

These notes complete the rules, and instructions are appended on the subject of "How to Deal with Accidents," "Faulty Cars," etc., which are all especially open to discussion. The chapter dealing with "accidents" is the fullest. Too much stress cannot be laid upon the absolute necessity of obtaining a correct version of the occurrence, irrespective of whether members of the staff are to blame or not. Accidents are bound to occur, and there is nothing more annoying than for a manager to be misled by an employee anxious to put the best side of his story forward. It is also of the greatest importance to obtain the names and addresses of witnesses, whether they actually saw the accident or not; and this cannot be too fully impressed upon the staff. "How to Deal with Offenders under the By-Laws" is also useful for the staff. Offenders in my experience, will generally give names and addresses, but it is often desirable for an inspector to follow the offender in order to check these. Obstruction by vehicles is the commonest of these offences, and the most difficult for which to obtain satisfactory redress. Short instructions are desirable of how to deal with the ordinary faults which may dislocate services: "faulty cars" or "faulty overhead." There is a great divergence of opinion amongst tramway managers as to exactly what they expect under these circumstances. Personally, I think that every motorman should be capable of repairing or adjusting, at least, simple faults—at the termini, of course, if possible, in order to obviate having needlessly to shed the car and to prevent upsetting the traffic; or he should be capable of satisfactorily cutting any faulty overhead section dead. It may be argued that these are details for the school, but they are simply added as "refreshers," and very useful as such. They can, of course, be elaborated or cut out altogether as the individual manager thinks fit.

### CONCLUSION.

In conclusion, it only remains for me to ask the indulgence of the members of the Association in the discussion which is to follow, on behalf of my fellow-members of the sub-committee and of myself. And I would take this occasion of thanking the various members and others on behalf of the committee for copies of their rule books. A large amount of attention has been paid to the subject, and whilst the committee realise, in submitting these rules and regulations to the Association as a standard, that they must largely be governed by local conditions, it is hoped that they may be of some small use to the industry from the employers' as well as from the employees' point of view.

## APPENDIX.

COPY OF LETTER FROM MR. W. MORRIS, DATED FEBRUARY 17, 1913.

Rules 12 and 14*d* may conveniently be considered together.

"There is a distinction to be made between 'motormen' and 'conductors.' A motor omnibus driver has been held, in the case of *Smith v. Associated Omnibus Company* (Law Reports, [1907] 1 K. B. p. 916), to be a 'workman' within section 10 of the Employees and Workmen Act, 1875. It is assumed, and I think rightly, that he is also a 'workman' within the meaning of the Truck Acts, 1887 and 1896. The deductions contemplated by Rule 12 for some of the matters mentioned therein, as for instance 'disobedience to or disregard for any of the by-laws and regulations' would be illegal under these Acts.

"The deductions for damage or injury to uniform would not be illegal under the Truck Acts if the provisions of these Acts relating to such deductions were strictly complied with, *e.g.*, contracts in writing (not verbal) authorising such deductions must be signed by the employee, and particulars of the acts, omissions or things for which the deduction is made and the amount thereof (which must be fair and reasonable) must be given in writing by the employer to the employee.

"A conductor has been held, in the case of *Morgan v. London General Omnibus Company* (Law Reports, [1884] 13 Q. B. D., p. 833), not to be a workman, and the provisions of the Truck Acts therefore may be considered as not applying to 'conductors.' In order, however, to be valid, the regulations, even in the case of conductors, must be incorporated in a written contract signed by the conductor, and the conductor must be given an opportunity of being heard by the general manager before he exercises his discretion (see the decision of the Court of Appeal in *Armstrong v. South London Tramways Company*, (1890) 65 Law Times (N. S.) 96).

"With reference to Regulation No. 18, viz.:

> 'No legal action, whether criminal or civil, arising out of service matters is to be undertaken without the permission of the general manager.
>
> It is strictly forbidden to detain or give into charge any person except for the following reasons: "Wilful destruction of the company's property, or, in case of collision, where injury has been done. In case of dispute with a passenger about non-payment of a fare, or value of coin received, employees must act with caution. If necessary, the name and address must be obtained, but on no account must the passenger be detained, or resort had to a police charge."'

"The first paragraph seems to me to be rather too wide.

"With regard to the second paragraph I have some doubt as to the exception in the first sentence contained in the words 'or in case of collision where injury has been done,' as it seems to imply that the conductor can give in charge in such a case, and I should doubt the legality of this."

## DISCUSSION ON MR. MASON'S PAPER.

Mr. A. W. A. CHIVERS, of the British Electric Traction Company, said most of the delegates would remember that in the early part of the year they were nearly in the throes of a railway strike, brought about very largely by reason of the fact that one of the employees of the Midland Railway Company refused to break one of the company's rules. It appeared that there was an understanding between the company and the employees whereby, under certain circumstances, the railway men—he believed it was the drivers in this case—were enabled to break certain rules when requested to do so by those in authority. The rules as printed said that no train should take more than a certain number of wagons, but when these wagons were empty a larger number could be taken if the brake power of the engine would enable it to be done with safety. In this instance an inspector authorised the train man to take more than was allowed by the rules, and the train man refused, with the result that he was suspended. The railway employees' union took the matter up, and said it was not fair to suspend him when he was conforming strictly to the letter of the rules. There were in the tramway rules which had been printed certain matters that might very advantageously be deviated from in particular circumstances, and he thought that if some provision were made in the rules, whereby under such circumstances a driver or conductor be allowed to deviate from the strict letter of the rules on receiving special instructions from those in authority, it would be of great benefit and be conducive to the smooth working of the undertakings. It would give a little more flexibility, and that was desirable.

Mr. C. D. STANLEY (New St. Helens and District Tramways Company), referring to offences in tramcars, said that most offenders generally gave names and addresses, but in 19 cases out of 20 they were false. What instructions could be given to their men as to when and where not to detain a passenger if they felt that the name and address given was false. There was a difficulty in instructing a conductor in a case like that, because if they went too far they might land the company in a difficulty.

Mr. MASON, in reply, said the committee thought that where deviation from the rules was considered necessary, the several officers on the road would take the responsibility. Regarding the detention of offenders on cars, if it was thought the name and address were wrong, and unless the offence was a serious one, they generally tried to get an inspector to follow the offender and see where he lived. The magistrates generally came down harder on a man who gave a wrong name and address.

The Hon. ARTHUR STANLEY thanked Mr. Mason for the way in which he had brought forward the model rules, and also thanked the committee for the time and trouble they had taken over them. As this was the close of their business, he proceeded, they would wish their last act to be to place on record an expression of their appreciation and their very hearty gratitude to the Mayor and Corporation of Blackpool, to the Corporation Tramways Committee, and to the two other tramway companies for the very kind way in which they had entertained them. There had been no opportunity of thanking the Lytham and St. Annes Tramway Company on the previous day, so he did so that morning. They had not only had a most enjoyable time, and an experience that they would long to repeat, but he honestly believed the Conference would have been one of the most important—if not the most important—they had had, and that lasting and good results would come of it.

Mr. H. ENGLAND seconded the vote of thanks, and said that Mr. de Turckheim and he had been jointly responsible for the local arrangements, and they had had to see the Mayor, Mr. Furness, Mr. Cameron, and Mr. Laing on several occasions. These gentlemen deserved very hearty thanks for the way in which they had responded to their call. The arrangements could not have been better carried out. They were delighted with the success of the Conference, and they felt they were going on better year by year. (Applause.)

The MAYOR briefly acknowledged the vote of thanks. He felt sure that the Corporation would give them another invitation to come to Blackpool, and he hoped he would be present to assist in giving them a hearty greeting.

## REPORT OF THE LIGHT RAILWAY COMMISSIONERS.

The annual report by the Light Railway Commissioners of their proceedings up to December 31, 1912, and the report of the proceedings of the Board of Trade, under the above-mentioned Act, are as appended: "On December 31, 1911, three Orders were before the Board of Trade awaiting confirmation; these were confirmed in the year 1912. During 1912, nine fresh Orders were submitted to the Board of Trade by the Light Railway Commissioners for confirmation. The Board considered each Order with special reference to the points mentioned in section 9 of the Act, and made such amendments in the Orders as were deemed necessary. Six of the Orders submitted during 1912 have been confirmed, making, with those above referred to, a total number of nine Orders confirmed by the Board in the course of the year; and the remaining Orders are still under consideration. In no case did the Board refuse to confirm an Order. The Orders confirmed in 1912 authorise about 12 miles of line, at an estimated cost of £162,455. A list of the Orders confirmed by the Board of Trade in the past year, with the date of confirmation and the mileage authorised, is appended to the report in continuation of lists in previous reports. Since the date of the last report, the Treasury have conditionally promised a loan, under section 5 of the Act, not exceeding £17,000, towards the construction of a proposed light railway in the County of York from Richmond to Reeth (Swaledale Light Railway). The Light Railways Act, 1912, amending the Act of 1896 in several respects, received the Royal Assent on December 13 last. Amongst other provisions it increases from £250,000 to £750,000 the amount placed at the disposal of the Treasury under the Act of 1896 for special advances in aid of light railways, and also extends the powers of the Commissioners for a further period of five years."

## TROLLEY WIRE COPYRIGHT ACTION.

At the Lancashire Chancery Court, Liverpool, on June 24-26, the British Insulated and Helsby Cables, Limited, claimed damages against the London Electric Wire Company and Smiths, Limited, of Anaconda Works, Salford, for an alleged infringement of their registered designs for overhead trolley wire for electric tramways, and they asked for an injunction to restrain the defendants from further infringements of their copyright.

Evidence was called for the plaintiffs to the effect that the defendants sold, or offered for sale, trolley wire to the Corporations of Halifax and Wallasey which had been made in accordance with, or was an obvious or fraudulent imitation of, the plaintiffs' designs. One of the representatives of the plaintiff company stated that 35 Corporations in this country had been supplied with plaintiffs' wires, and that they had also supplied South Africa and Australia in large quantities.

Mr. W. M. Mordey, electrical engineer, Westminster, said in his opinion the wires supplied by the defendant company were an infringement on the plaintiffs' designs. The wires of the plaintiff company surmounted in the fullest degree the difficulties previously experienced in relation to the attachment of the trolley wires to their overhead support.

Witnesses were called for the defendants, who contended that the designs which the plaintiffs claim as their copyright were anticipated, and that they were neither novel nor original. Judgment was reserved.

## RATING OF TRAMWAYS.

JUDGMENT RESERVED IN APPEAL TO HOUSE OF LORDS.

In the House of Lords on June 26, before the Lord Chancellor and Lords Shaw and Moulton, arguments in an appeal by the Urban District Council of Tottenham against an order of the Court of Appeal in favour of the Metropolitan Electric Tramways, Ltd., were concluded.

The respondent company are the occupiers of and work as one continuous system certain tramways and light railways in the North of London, all of which system was constructed along public streets, and in respect of which statutory powers had been obtained. In the present case, part of the company's present system originally was constructed under tramway powers. The Council took the point that as to that portion, although now electrified, the partial exemption given to "light railways" did not apply, and they claimed the full rate, namely, £495, from the company. The company paid £123, one-fourth part, but refused to pay the other three-fourths, £371. The Justices were of opinion that the old tramway portions of the company's system—as to the new portion there was no dispute—was not a "railway" within the meaning of the section in the Public Health Act, 1875, and made an order on the company to pay the balance of the rate.

The Divisional Court upheld the decision of the Justices, but the Court of Appeal decided that the tramway portion came also within the exception, and that the company were only liable to pay, as before one-fourth of the assessment.

Mr. Macmorran, K.C., Mr. W. Ryde, K.C., and Mr. W. H. C. Sharp appeared in support of the appeal; and Mr. Danckwerts, K.C., and Mr. C. C. Hutchinson, K.C., were for the respondent company

Mr. MACMORRAN said that the tramway was constructed under Parliamentary powers obtained for its construction as a tramway and not as a light railway. The true test as to whether it was a tramway or a light railway, as pointed out in the Swansea case, was what powers did the private Acts confer on the undertakers? When power was obtained to construct these tramways, they were to be propelled by horse-power. In all of these Acts of the company the lines were dealt with as tramway lines. They purported to incorporate the Tramway Act; there was no mention in any of them of the Railway Clauses Consolidation Act. Later, horse-power was replaced by electrical traction, but it was still a tramway. Light railways were constructed under Acts of Parliament which were differently drawn to Acts of Parliament for the construction of tramways. In the present case their Lordships would have to consider the County of Middlesex Light Railway Orders of 1901 and 1903, both made and confirmed under the Light Railways Act, 1896. His submission was that this case was governed by the Wakefield case, 1908, A.C. 293. That was a decision as to light railways, and it was held that by virtue of the Light Railways Act, 1896, the light railway was a railway to which Sec. 211 (1) (B) of the Public Health Act, 1875, applied. The decision in that case went on the ground that the undertaking was not constructed originally as a tramway, and was, therefore, a light railway, and the House of Lords adopted the view expressed by the Court of Appeal. The Swansea case which was then decided it was reported, 1892—on which the Divisional Court acted, presumably was brought to the notice of this House when the Wakefield case was argued, and if they had thought it not good law they would have overruled it.

The LORD CHANCELLOR: You invite us to hold that the Swansea case governs this case, and that the Court of Appeal were wrong in overruling it, and following the case of Thornton Urban District Council *v.* Blackpool and Fleetwood Tramways Co., decided in 1909?

Mr. MACMORRAN replied in the affirmative, and said that prior to 1904 respondents, in respect of the tramway, were assessed to the general rate of the district as a railway was assessed under Sec. 211 (1) (B) of the Act of 1875—namely, in the proportion of one-fourth part only of the net annual value; they then came to the conclusion that they were tramways, and therefore not entitled to the reduction.

Mr. DANCKWERTS, K.C., for respondents, said there was nothing mysterious in the word "railway." Rails fixed to sleepers on the ground were as much a railway if used for carriages to pass over whether the undertaking was promoted under a private Bill for a tramway or a light railway. The important point was that the railway was constructed on the land under powers of an Act of Parliament. That distinguished it from a railway put down by a company, for example, to link up their colliery with a railway company's sidings. The tramways and light railways described in the case were identical, and their user and working were identical and as one system, and each was used under statutory powers, and it was an unreasonable conclusion to hold that the light railways were land used only as a railway constructed under statute, while the tramway was not. In all the early statutes a railway was always spoken of as a "railway or tram road." The judgments in the Swansea case, the counsel submitted, were not in accordance with various other cases which he cited. The true view of the matter was that taken by this House in the Thornton case, and applying that principle here, the tramway was a "railway" within the meaning of Sec. 211 of the Public Health Act.

The Lord Chancellor reserved the decision.

## PRIVATE BILL LEGISLATION.

MORLEY CORPORATION RAILLESS TRACTION.—During the hearing of their bill, which was opposed by the West Riding County Council, it was announced that the Corporation had agreed to pay three-eighths of a penny per car-mile to the cost of maintaining the roads, and a clause to this effect was inserted in the bill. It is proposed to run cars through Drighlington, Gildersome, Morley, and East and West Ardsley. Leeds Corporation are to work the system, and will pay a rent sufficient to meet the interest on capital expended and the sinking fund.

LONDON COUNTY COUNCIL TRAMWAYS.—Sir Ivor Herbert's Committee of the House of Commons, on June 17, granted the clause in the London County Council's bill to empower the tramways department to carry in the cars a number of standing persons, not exceeding one-third of the inside passengers, on the following occasions: Inclement weather; Sunday; Bank Holiday; some other public holiday; Saturday after 12 noon; what the Commissioner of Police agrees is "a special occasion." On June 19 the Committee granted a clause enabling the Council to work the London United Tramways in Askew Road and Paddenswick Road, which are within the County Council boundary at Acton. The committee added a condition that the Council should concede to the company the right to run over the route within the county boundary, upon terms to be agreed on or fixed by arbitration, in order to secure the continuance of through running for the convenience of passengers to Shepherd's Bush and Hammersmith.

WEST BROMWICH CORPORATION RAILLESS TRACTION.—A decision was arrived on June 4 by Mr. E. Gardner's Select Committee of the House of Commons who heard evidence for and against this bill. The estimate for the proposed new trolley vehicles and equipment was £18,197, for motor omnibuses £8,000, and for the purchase of land and street improvements £15,000. The Corporation asked for power to run motor omnibuses within the borough and without the borough by agreement with the local authorities through whose district the omnibuses were run. The Committee granted the powers asked for in respect of trolley cars and motor omnibuses, except between Greets Green and Great Bridge, this route not to be undertaken without the consent of the Tramway Company during the remainder of their lease. To save the Council from having to promote another bill the Walsall route would be dealt with on the same terms. In regard to the clause which would give the Corporation power to apply to the Board of Trade for a provisional order to sanction new routes, the Committee decided that this power should be granted only in respect to converting omnibus routes into trackless routes.

WESTERN VALLEYS (MON.) RAILLESS TRACTION.—This bill, which seeks powers to provide means of locomotion in a mining district in Monmouthshire, was considered by a Committee of the House of Commons on June 23-26, presided over by Mr. Clancy. For the promoters, Mr. Knox stated that the capital powers would allow the company to raise £60,000 in shares and £20,000 in debentures. They asked for power to construct a generating station, leaving it open to them afterwards to arrange with the local authority if they could agree on a reasonable price. Mr. J. B. Hamilton and Mr. G. Conaty were the chief witnesses called in support of the bill, the last-named stating that the roads were too narrow for tramways and too steep for motor omnibuses. They were in good condition, and quite suitable for railless trolley traction. The opposition came from local authorities, who asked for contributions towards road reconstruction and maintenance. The promoters offered a farthing per car-mile after first refusing to make any offer, and the Committee passed the preamble subject to the inclusion of a clause that the charge for road maintenance should be three-eighths of a penny per mile, excluding workmen's cars, and that one-third of the cost of reconstruction should be paid in urban districts, such one-third not to exceed £500.

MEXBOROUGH AND SWINTON RAILLESS TRACTION.—Between June 3 and 12 inclusive Sir Ivon Herbert's Committee of the House of Commons sat on several occasions to hear the evidence relating to the railless trolley bill promoted by the Mexborough and Swinton Tramways Company. Mr. E. H. Lloyd, K.C., for the company, stated that it was proposed to equip several routes in mining districts with a total mileage of 6¼ miles. Borrowing powers to the extent of £35,000 were sought. The railways could not cater for the local traffic, because the stations were miles from the centres of population. Alderman D. L. Winter, Rotherham, a director of the company, said that in his experience trolley vehicles possessed great advantages over tramways. The present means of communication between the mining districts were inadequate. The Committee were not satisfied that the route from Swinton to West Melton was planned to meet the needs of the district, and they deleted that portion of the bill. They approved the two other routes, and suggested that a route should be included from Ardwick-upon-Dearne, northward to Goldthorpe. They decided that the promoters should pay one-third of the cost of adapting the roads to trolley vehicle traffic, such sum not to exceed £350 per mile, and thereafter three-eighths of a penny per car-mile for road maintenance.

LONDON, JULY 10, 1913.

**Cost of Road Maintenance.**

It was made increasingly clear from the discussion at the Blackpool Conference of the Tramways and Light Railways Association, to which much of this issue is devoted, that the time is now ripe for a concerted movement in this country for putting road and street maintenance on a more equitable footing. The Hon. Arthur Stanley, who is interested both in automobile vehicles and in tramways, voiced what is fast becoming the general opinion. As we have frequently discussed the main facts, we need do little more here than mention them—namely, that tramway traffic which does not wear out the roads at all is burdened with heavy charges for road maintenance and for rates on the tracks, while motor omnibuses and other heavy motor vehicles and trackless trolley cars, which do wear out the roads, contribute nothing to maintenance and pay no rates in respect of the use of the roads. The petrol tax does not go to maintenance but to improvements and new roads in districts where little of the tax accrues. On the one hand we have road authorities, both urban and rural, groaning under the expenditure to which they are put for road maintenance required owing to automobile traffic; on the other hand we have tramway authorities protesting against the increasing cost of maintaining the parts of the roads for which they are responsible and to the wear of which they do not contribute. The recent Road Congress held in London—in which tramway interests had next to no representation—gave evidence of international opinion in favour of reform. Among the resolutions which were passed were two in favour of maintenance of main trunk roads being borne out of national revenue and in favour of vehicles being specially taxed, which on account of weight or speed cause special damage to roads.

* * *

Parliamentary Committees which have considered during this session bills authorising trackless trolleys and motor omnibuses have recognised the fact that general legislation is necessary, and have refrained from imposing specific terms on promoters. They have, however, confirmed compromise agreements either for payments of three-eighths of a penny per mile run towards maintenance, or for arbitration to settle amounts. Such piecemeal arrangements are not satisfactory in themselves and, moreover, they cannot be applied to cases where companies run motor omnibuses. A company requires no Parliamentary powers to carry on that work. The present hardship to road and tramway authorities in London is beginning to spread over the country as the use of trackless cars and motor omnibuses extends. Thus we may expect to find road authorities and the two Tramway Associations making common cause. It seems rather doubtful whether any help can be expected from any of the automobile interests, though the suggestion that the Roads Improvement Association might be approached is worth adopting. In any event the time has come for a fully-developed agitation which should have for its two main features the abolition of the charge for road maintenance on tramway undertakings and the placing of the burden on those who chiefly wear out the roads—namely, automobile and trackless trolley vehicles, especially of the heavier classes. The burden should take the form of a tax proportional to mileage run, and the money should be specifically ear-marked for road maintenance. In this agitation the road and

Digitized by Google

the tramway authorities may expect to get the support of the general public, as the ratepayers, both in town and country, are suffering severely from the charges for road repairs—charges which, compared with a few years ago, are enormous. It is only by combined influence being brought to bear on Parliament that anything can be done. Long experience has shown that strong pressure alone can induce Parliament to give time for practical reforms which have no political taint about them. All the parties concerned in this matter must therefore take their coats off if anything is to be done.

---

**Trail Cars in London.**

Provincial tramway authorities who may be considering the question of employing trail cars in the carrying of their rush-hour traffic should find the path for acquiring powers made easier by the experience of the London County Council. Several undertakings have had the matter under consideration since, in our issues of April, 1912, we published an extensive range of opinions of foreign tramway managers and others in support of the application which the Council made to Parliament for powers in June of last year. A year before that period the Board of Trade had allowed an experimental service to be carried on over a route of heavy traffic from Euston to Hampstead, and although it proved very successful and there were no complaints, the police triumphed in their unreasoning opposition by the expedient of refusing to license the trailers. Notwithstanding that four organisations—police, private motorists, commercial motor owners, and the omnibus companies—opposed the Council's application to Parliament, the case was so strongly supported that the House of Commons Committee had no hesitation in bestowing powers, subject to regulations to be made by the Board of Trade. An important factor in securing the clause was an experimental trip which the Committee made in a car and trailer from Westminster Bridge to the south end of Blackfriars Bridge, but the whole case was presented in a manner that could not fail to secure success for the public interest against biassed opposition and the bureaucrats of Scotland Yard who seek to usurp the functions of the engineers of the Board of Trade. The police opposition was countered by the evidence of a Paris tramway witness, that the police in that city were in favour of trail cars, whilst the Brussels tramway manager was able to announce that experimental running had converted the police there to an opinion in favour of this means of remedying congestion. Another circumstance which should not be lost sight of, in view of trailer applications next year by Birmingham and other cities, relates to a controversy concerning congestion of traffic in the centre of Manchester a few years ago. There the owners of other vehicles sought to create trouble for the Tramways Committee because of the disregard paid at busy crossings to the regulation which requires an interval of ten yards between the cars. It was recognised, however, by the authorities that the closer together cars can be passed over a crossing the sooner will the space be cleared to permit vehicles to come from another direction.

* * * *

Regard should also be paid by the younger generation of managers to the evidence given in support of the London application by Mr. Stephen Sellon, who, as representing the Tramways and Light Railways Association, reminded the Committee that trailers were used in the days of steam cars, and that the working both then and subsequently showed that they reduced the liability to accident by 50 per cent. Some recompense for the experiments and delay which have had to be faced in the introduction of the trail car to London, is to be found in the improvements which Mr. Fell and the Board of Trade have effected. As the result of his experience of the Euston-Hampstead experiment, the chief officer of tramways has adopted a telescopic guard between the leading and trailing car in place of the gate arrangement at first utilised. If the rear car is also a motor car, both are to be fitted with electro-magnetic brakes, so that if the cars separated the trailer stops dead by the brakes coming into operation. For trail cars without motors a special form of spring brake has been devised to produce instant stoppage. This spring attachment has long worked satisfactorily down the second steepest gradient in London, namely, Dog Kennel Hill, where the descent is 1 in 10·7. An improvement for which the chief inspecting officer of the Board of Trade is responsible, concerns the

Digitized by Google

possibility of the automatic coupling on the tractor car interfering with the satisfactory operation of lifeguards when the car is working independently of the trailer. A new set of couplers, devised by the manufacturers, has been tried, and appears to be quite satisfactory. Testimony should be borne to the excellent spirit which the Board of Trade are showing in their supervision of the three months' experiment which was entered into upon the Woolwich and Eltham overhead trolley route on March 17 last. The lines there, although well used by traffic at certain times, are not typical of London's busiest routes. In the ordinary course of things the Board had called for a report on the running, but they have agreed to a further three months' trial first. This is to take place on a conduit route between the Embankment and Tooting, this circular line carrying the heaviest traffic in London, and passing through the busiest traffic centre used by both tramcars and motor omnibuses.

**The Tramways Problem.**

Even the most enthusiastic advocate of tramways must realise that their future is not so rosy as it was but a short while ago. At one time they held the field, but their very success raised a host of competitors. The steel tyre on a steel rail has, however, been found harder to beat than was fondly hoped in some quarters. For smooth working tramways run the best railways very close, and when both the rolling stock and the permanent way are in first-class order they really form an ideal conveyance for comfort, noiselessness, and absence of noxious fumes. All tramway managers should take these facts to heart and should realise that the only way to secure the number of passengers they have had hitherto, and even to attract more and more of them, is not to spoil the ship for a ha'porth of tar. If efficiently maintained the very conditions essential to the forming of an ideal road act as advertisements, and, as all advertisements of a really good thing have been found to do, invariably and with mathematical certainty repay any maintenance expenditure in increased receipts. The question of corrugation is a crying one in this connection, for in spite of the oceans of ink and the floods of talk that have been spent on it, we seem to be no nearer a solution of the problem or a radical cure of the evil than we were the many years ago when the trouble first became acute. A roaring rail is always an insupportable nuisance. That noise of any kind is preventible is an accepted axiom in mechanics; moreover, a noisy machine is an imperfect one, and one that should not be tolerated in these days. Corrugations cannot be prevented, but they can be ground down before they cause a nuisance. Similarly wear and tear of working parts are unavoidable, but should be made good long before any loud rattling takes place. The very men who can design and work machines day in and day out for years on end with no appreciable noise whatever should surely be able to keep tramcars in perfect order—given the necessary funds. Tramway authorities might well take to heart what has been effected in the case of many motor vehicles, which are now practically silent workers; nor should they hug themselves with the complacent and erroneous idea that any of them are quite safe from competition. The power of public opinion is irresistible in the end, and if, in any town whatever, a tramway system becomes an intolerable nuisance by reason of bad construction or slack maintenance, that tramway system is bound, sooner or later, to be superseded by another mode of transportation. Corrugations are not the only sinners: brakes when violently applied or when used without judgment are almost as bad; for not only do they tear up the head of the rail and cause flats on the tyres with a terrible grinding noise, but they swing and toss passengers about, causing in some cases so much *malaise* that passengers naturally prefer other means of getting about. Of the little amenities on the part of employees which cost nothing and are so much appreciated we have written time and again; of the smart looking out for would-be passengers; of the collection of old tickets; and of the attention to the ventilation. These comparatively trifling matters all tell in favour of any tramway system that adopts them or any other means for adding to the comfort of their patrons and therefore to the number preferring the pleasanter mode of travel wherever competition exists; or who travel when otherwise they would not, attracted by the absence of irritating noise and other inconveniences.

**Payment on Entry.**

No better proof of the advantages derived from passengers paying their fares on entry could be desired than is provided by the circumstance that Liverpool (one route), Leeds, Sheffield, and Bradford have made it a practice to take the fares of top-deck passengers as they board the platform at intermediate stopping places. This method has proved so successful on a few trial routes at Leeds that it has been extended over the whole of the tramways. Portsmouth is the latest place to follow suit, and the beneficial results of the innovation are so obvious that many other undertakings may be expected to engage in experiments. From the points of view of the P-A-Y-E Company and of the car crews these innovations are to be welcomed, for the experience gained on cars not possessing the more commodious and specially fitted entrance and departure platforms should in course of time result in a desire to try the effect of a properly equipped car. Only by this course will managers be able to avoid the complaints that the imitation system gives rise to. By adopting the system of specially coloured tickets the company have met the chief objection of varying fare stages which at the outset was urged against their scheme in this country, and the experiences of Gateshead with single-deck and of Leicester and Aberdeen with double-deck cars go to show that there is no foundation for the only other ground of criticism—the fear that payment on entry results in the blocking of traffic at busy stopping points. Indeed the contrary result follows, for almost by the time departing passengers have descended at the front the incoming people have paid their fares on the other platform. A gratifying outcome at Aberdeen is shown in the financial returns on the Woodside route, where the prepayment cars are running. The ninth week of their introduction gave a revenue increase of £19, while for the whole nine weeks the receipts were up by £246. The inference to be drawn from this is that missed fares and overriding are prevented.

---

**A Suggestion for Hastings.**

The Hastings and District Electric Tramways Company is confronted by a peculiar problem which is the more interesting because it is in many respects unique. The Act of 1903, under which the tramways were constructed, requires the company to adopt self-propelled cars on the sea front or to work that part of the line by some other system than the overhead with which the remainder of the track is equipped. The Dolter system was accordingly installed in 1907 with the approval of the Corporation, and Hastings is now the only place where this method of supplying current from studs in the roadway remains in operation. It has been found here, as elsewhere, expensive and unsatisfactory. The Board of Trade ordered an inspection last year at the instigation of the Corporation, and reported to this effect, whereupon the company, after endeavouring to come to an agreement with the Corporation for the installation of the overhead system, applied to Parliament for powers to override their opposition. This was not, perhaps, the wisest course to pursue. Not only did the Corporation oppose, but the frontagers raised a fund and briefed counsel to fight the bill, with the result that a House of Lords' Committee decided the bill must not proceed. Meanwhile the Board of Trade advised the company that they proposed to forbid further employment of the Dolter system after next September the fifth. Some new method has consequently to be devised for drawing the cars along the sea front during the next three months. The slot system is impractical on account of the cost, also because the roadway is made on a foundation which does not admit of it, and any motive mechanism placed on the cars themselves would have to be carried idle over the whole distance to Bexhill and Cooden unless journeys were broken at either end of the sea front, which would be a grave inconvenience to the public. A comparatively light petrol motor coupled on to the tramcars when they reach the sea front would provide sufficient tractive power to draw them over it. It could then be detached, and the distance being short but few of such motors would be needed to deal with the whole traffic. The cost of supplementing every car with the means of self-propulsion would indeed be prohibitory, especially as the gauge is 3 ft. 6 in., and space is cramped as it is. Possibly, however, the improvements in accumulators referred to in our last issue might permit the cars to receive current from a storage battery carried on a trailer over the critical two miles.

## PETROL-ELECTRIC CAR IN IRELAND.

In a paper on self-propelled cars for light railways, read by Mr. J. P Tierney before the Dublin section of the Institution of Electrical Engineers, the author described a car that he had designed for running over the lines of the Dublin United Tramways Company and the Dublin and Blessington Company, which is at present operated by steam locomotives. The car measured 40 ft. over the buffers, the body was of the centre-entrance type, the entrance for passengers being not exactly in the centre, but placed at a point one-third of the total length of the car from one end. At this entrance a doorway to the right led into the passenger compartment and a door to the left into a special compartment containing the plant. Also to the left was a straight incline staircase leading to the top deck. By this means space was economised, and it was possible to get the plant partly under the staircase. At each end of the car was a driver's compartment, with the necessary control apparatus. The passenger compartment, which seated 36 passengers, was divided into two classes, first and third: the top deck seated 69, leaving a total seating capacity of 105 passengers. One bogie truck was equipped with two 54-H.P. motors, capable of propelling the car with a 10-ton trailer at a speed of 25 miles per hour on the level, and a speed of from six to eight miles per hour on a grade of 1 in 25. On the Blessington line for a distance of three miles the grade averages 1 in 35, which in one place is as steep as 1 in 20. The power plant consisted of a 100-H.P. petrol engine, driving a 65-KW. direct-current compound-wound interpole dynamo. In addition there was a small petrol engine driving a vacuum exhauster for the vacuum brakes, and a small lighting generator for lighting the car. The engine was water-cooled, radiators being provided on the roof in front at one end, in the position usually occupied by the destination indicators. The car was also fitted with an ordinary trolley for running on the city lines. The control would be duplicate, the ordinary series-parallel controller for operating on the trolley section, and a controller on the shunt field of the dynamo for operating on the petrol set.

In his reply to the discussion Mr. Tierney referred to the petrol-electric car with the Thomas transmission system on the South African Railways, which was illustrated in the TRAMWAY AND RAILWAY WORLD of February 8, 1912. Mr. Tierney said that with petrol at 1s. 6d. per gallon, the costs worked out at 4d. per car-mile. They hoped by the use of paraffin to reduce the cost by 1½d. per car-mile. He did not advocate a petrol-electric system in preference to a purely electrical one where the latter could be obtained, especially on the account of the very superior acceleration obtainable with electric cars.

## THE PECKHAM RADIAL AXLE TRUCK.

This truck is designed for car bodies that require a 9 ft. or 10 ft. wheel base truck, and is particularly adapted for short radius curves. It is an improvement upon the Peckham patent pendulum truck, described in a previous issue. The special feature of this truck is the construction of its radial axle gears that support the truck frames upon the axle boxes in such a manner that the wheels and axles can adjust themselves to the curvatures of the rails, and move both laterally and radially independent of the truck frames, combining the lateral movement of the Peckham pendulum and radial trucks, described in our issue of February 6, without the use of a sub-truck.

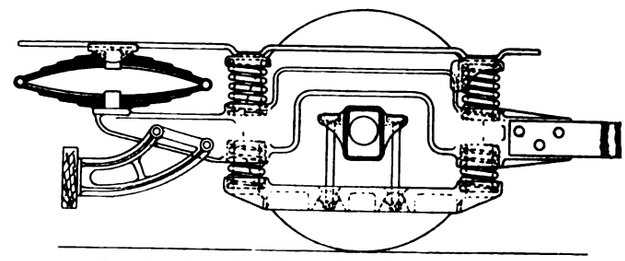

Fig. 1.—Construction of Radial Axle Gear.

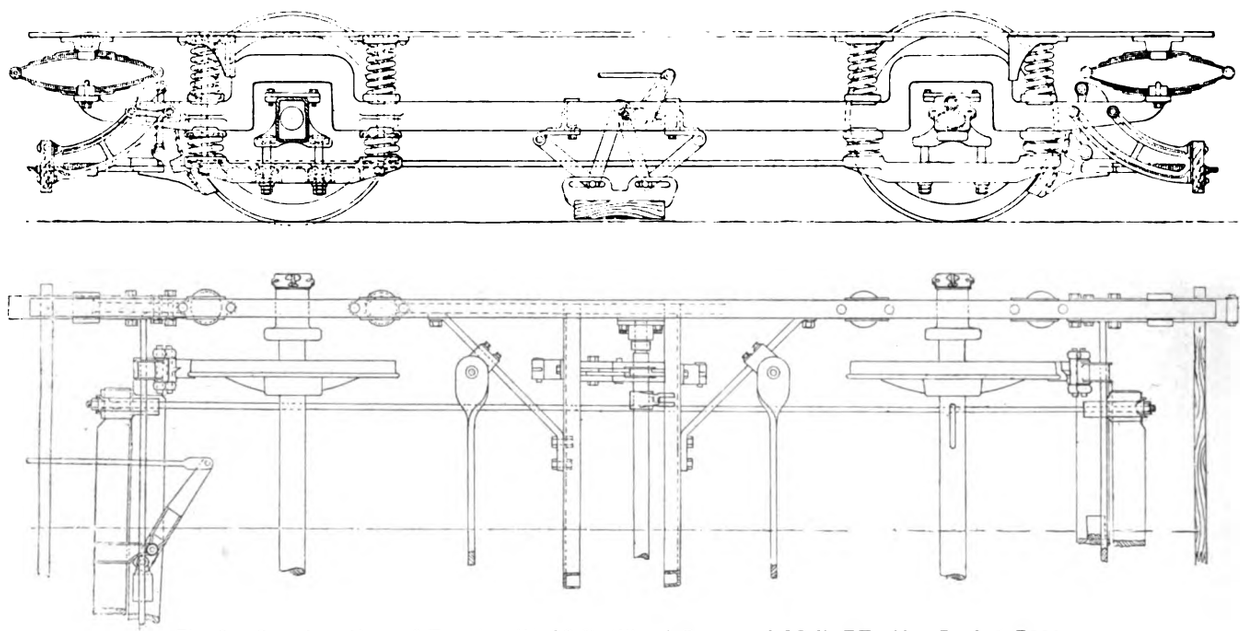

Fig. 2.—Construction of Truck with 10 ft. Wheel Base and 13 ft. Effective Spring Base.

Fig. 1 shows the construction of the radial axle gear. This consists of an independent auxiliary frame, supporting by springs the truck frames from the axle boxes by means of "ball-shaped links" suspended from the axle boxes. The width of the pedestal jaws and the length of the links are made to suit the length of wheel base and radius of curves. Fig. 2 shows the construction of the truck with a 10 ft. wheel base and

Digitized by Google

13 ft. spring support of side frames (effective wheel base). Fig. 3 shows the Peckham radial axle gears as applied to a truck under a Derby Corporation car. The operation of this gear has been so satisfactory that the Derby Corporation have equipped all of their radial trucks with these gears. The manager states that the cars ride smoothly without galloping or side swinging, and that the current consumption has been reduced. These gears are also in successful operation on the Birmingham and Midland Tramways.

With the 8 ft. wheel base pendulum truck for 16 ft. to 18 ft. double (or 28 ft. to 30 ft. single) decked cars, and the 10 ft. radial axle truck for 18 ft. to 20 ft. double (or 30 ft. to 35 ft. single) decked cars, and the 12 ft. to 14 ft. wheel base, single axle radial truck for 22 ft. to 24 ft. double (or 35 ft. to 40 ft. single) decked cars, the Peckham system of flexible gears and long wheel base four-wheeled flexible geared trucks is complete, and can be adapted to all lengths of tramway cars.

The advantages of the Peckham flexible gears and long wheel base trucks have been demonstrated upon several tramways during the past three years. These advantages include smooth and easy riding of the cars; prevention of galloping thus enabling longer four-wheel cars to be used, and the prevention of grinding of wheel flanges on curves, obviating the necessity of machine turning of tyres, and increasing their mileage 15,000 miles. A material reduction in the consumption of energy and increased economy in the cost of maintenance of wheels, rails, and roadbed are also secured. It may be added that the Peckham pendulum and radial axle gears can be applied to all types of existing tramway and railway trucks.

## WELDED JOINTS AT NEWCASTLE.

In a paper on the Newcastle-on-Tyne tramways, read by Mr. J. McKellar, of the city engineer's staff, at a meeting of the Municipal and County Engineers, held in that city, it was stated that of the various kinds of welded joints that have appeared from time to time during the last 10 years, the Thermit welded joint has probably made the most headway. This joint has been adopted very largely by some corporations, notably at Manchester and Leeds. Last year the company responsible for it were entrusted with over 800 joints on the eastern Newcastle extensions, the work being executed by Thermit, Ltd., and the results will largely determine its future in this city. Another weld of a different type—viz., the Tudor weld—has evoked favourable opinion; but this weld is somewhat more costly. In the discussion, Mr. Foster (Leeds), said that they had used the Thermit joint for 11 years, and it had been their standard joint for nine years. They had some trouble with breakages during the earlier stages, but of 7,572 joints welded between the years 1908 and 1912 there had only been 37 breakages, or 0·5 per cent.

Fig. 3.—Peckham Radial Gears Applied to Derby Top-Deck Car.

**Australian Difficulty in Obtaining Rails.**—An indication of the large and growing field in Australia for railway and tramway material was given by Mr. T. R. Johnson, Chief Commissioner for Railways and Tramways of New South Wales, in his evidence before the Dominion's Royal Commission. During each of the last two years, he said, the department had met considerable difficulty in placing orders for 3,000 tons of rails, and after months of delay had only been able to secure them in lots of 1,000 a month. "We," continued Mr. Johnson, "want rails, and we want people to take our orders."

## CONTRACTS AND ORDERS.

**Leyton Council** have accepted the tender of Mr. R. R. Todd, at £1,719, for the supply of new feeder cable.

**Croydon Council** have placed a contract with Mr. F. W. Honour for alterations and additions to the tramway offices.

**Dick, Kerr and Company** have obtained a contract for permanent way renewals in connection with Belfast Corporation Tramways.

**Babcock and Wilcox, Limited,** have received an order for the supply of steam, feed, and drain piping, etc., to Dundee Council, at £2,510.

**The Brush Company** have obtained a contract for supplying and erecting a 500-KW turbo-generator with condensing plant to Swindon Council.

**Rawtenstall Council** have placed an order with the British Thomson-Houston Company for a 1,500-KW. turbo-alternator, with condenser, etc.

**Walthamstow Council** have given a contract for a natural draught cooling tower at the electricity works to Messrs. Kater and Aukeromit, at £800. There were ten tenders.

**Chester Council** have accepted the subjoined tenders: Tudor Accumulator Company, storage battery, £7,470; Lancashire Dynamo and Motor Company, booster, £1,145.

**W. and A. Forsdike, Limited,** have received the contract for the erection of a building to house the new rotary converting plant at the Kelham Island power-station, Sheffield, at £3,210.

**Bullivant and Company** have received a contract to supply 15,000 ft. of 3½ in. cable for the Douglas Corporation Tramways. This is the seventh occasion that the company have been awarded similar contracts for Douglas.

**Walsall Council** have accepted the following tenders: British Westinghouse Company, 100-KW. rotary converter, at £636, and a high-tension feeder, at £70 10s.; Electrical Power Storage Company, renewal of storage batteries at three stations.

**Messrs. Paramors,** Margate, have received a contract for constructing at a cost of £15,062 the roadway and tramways on the viaduct to be built at the Dover Pier as an approach to the new marine station of the South Eastern and Chatham Railway.

**Derby Council** have accepted the following tenders: Newton Brothers, motor-alternator, at £1,835; Greaves and Company, chains for the coal elevator and conveyer; Brush Electrical Engineering Company, Limited, five roof covers for tramcars, £548.

**Glasgow Council** have placed contracts as appended: Bolckow, Vaughan and Company, steel rails and fish plates; British Thomson-Houston Company, 5,000-KW. turbo-alternator, for Pinkston power-station; Drake and Gorham, Limited, lighting fittings.

**Wolverhampton Council** have accepted the following tenders: Amies and Sharratt, additions to the electricity stores, £728; Vaughan and Sons, one 5-ton and one 3-ton overhead travelling crane, £105; Electric Construction Company, Limited, direct-current switch gear for the converter plant, £172.

**Liverpool Council** have accepted the tender of the National Steam Car Company for motor chassis for the tramways department, that of Pope's Electric Lamp Company for annual supply of 40-watt and 60-watt metal filament lamps, and that of J. Hunter and Sons, Limited, for 8,000 yards of worsted serge for use in the tramways and electricity departments.

**Bradford Council** have placed contracts as follow: Henry Barrett and Sons, steel work in connection with the erection of workshop extensions at Thornbury tramway depôt, at £1,230; Beecroft and Wightman, hard wood paving blocks to the tramways department; John Brown and Company, 200 steel tramcar tyres, at £350; Collier Brothers, four miles of grooved copper trolley wire, at £408.

**Doncaster Council** have given contracts as subjoined: Siemens Brothers Dynamo Works, alternator; Lancashire Dynamo Company, dynamo, at £168. Willans and Robinson, Limited, or J. Howden and Company are to receive a contract for a turbine and condenser, the decision being left to the chairman and vice-chairman of the Electricity Committee on the receipt of further information from the engineer.

**New Car Shed at Leeds.**—Messrs. W. Airey and Son's tender was recommended for acceptance at a meeting of Leeds Council for the erection at Sovereign Street of a tramway car shed, depôt, workshop, offices, and club for the employees. The amount of the tender was £23,199. It was stated that another tender came to £500 less, and the report was referred back to the Tramways Committee. On July 2 Airey and Son's tender was accepted.

**Sunderland Council** have allotted the following tenders: Sturtevant Engineering Company, air filter for new alternator; A.E.G. Company, Berlin, short-circuiting device for new alternator, also spare parts for alternator; Dick, Kerr, and Company, Limited, spare parts for alternator; Phœnix Dynamo Company, reinsulating one 750-KW. alternator; J. Thompson and Company, 1,500 yards wood troughing; B.I. and Helsby Cables, Limited, 4,000 yards L.T. cable, 500 yards E.H.T. cable; Crewdson and Hardy, 1,250 yards w.i. piping and bends.

**Newport Council** have accepted the tender of the A.E.G. Electric Company, Berlin, for a 3,000-KW. turbo-generator and steam condenser at £7,120, and the tender of the Lancashire Dynamo Company, Limited, for a 600-KW. direct-current generator at £925. Councillor Moxon, chairman of the Tramways and Electricity Committee, stated that the lowest English tender was £1,326 higher than the German firm's. The German firm gave a guarantee of delivery within 30 weeks, and of the 36 tenders received no other firm had come near that.

**Glasgow Corporation** have placed contracts as appended: E. Green and Sons, Limited, providing and erecting economisers at Port Dundas and St. Andrew's Cross power-stations, £2,705 and £1,848 respectively; Musgrave and Company, providing and erecting induced-draught fans at the same stations, £675 and £679 respectively; Balcke and Company, providing two air filters, £220 each; E. W. Bliss Company and W. C. Yuille and Company, Limited, gear wheels; British Westinghouse Company, Limited, car equipments, motors; British Thomson-Houston Company, Limited, car equipments, controllers.

**Manchester Corporation** have accepted the following tenders:

Drake and Gorham, Limited, traction type incandescent lamps; Estler Brothers, canopy trolley standards; Bolckow, Vaughan, and Company, Limited, steel fish plates; Bayliss, Jones, and Bayliss, Limited, steel tie bars; E. Green and Son, Limited, replacement of No. 3 economiser; S. P. Bidder and Company, repairs to chimney and exhaust pipe; General Electric Company, Limited, two 50-H.P. three-phase motors; Aiton and Company, low-pressure steam and water pipes; Siemens Brothers Dynamo Works Company, Limited, switch gear, bus bars, etc.; Holden and Brook, Limited, one electrically-driven boiler feed pump; Sturtevant Engineering Company, Limited, air filtration plant; De Bergue and Company, Limited, steelwork for foundations of 15,000-KW. turbo-generator; Bruce Peebles and Company, Limited, two 750-KW. motor converters; British Electric Transformer Company, Limited, requirements of 75-K.V.A. transformers; W. T. Henley's Telegraph Works Company, Limited, low-tension cable and paper-insulated cable; Electrical Engineering and Equipment Company, Limited, low-tension cable; Charles Macintosh and Company, Limited, rubber-insulated cable.

**Salford Council** have accepted the offer of Eccles Corporation to supply current for the tramways in Eccles for five years at 1·125d. per unit for a minimum consumption of 675,000 units per annum, and for all units consumed above that quantity at 0·75d. per unit. The Council have also accepted the following tenders: Bertram Thomas, copper strip for main lighting and power switchboard, £302; British Thomson-Houston Company, switch gear required for bulk supply at meter house of Lancashire Electric Power Company, £1,352; Brush Electrical Engineering Company, Limited, one double-deck, single-truck car body, with vestibule ends, £530; nine additional car bodies of a similar character at the price of £500 per car body, subject to a reduction of £30 per car body if after the experimental period has elapsed it is decided to have the nine car bodies without the vestibule ends; J. G. Brill and Company, 10 tramcar trucks, less wheels and axles, £548; Walter Scott, Limited, 1,000 tons of Sandberg steel tramway rails, at £7 7s. 6d. per ton.

**London County Council** have accepted tenders as under:

Frodingham Iron and Steel Company, slot rails and conductor tees for tramway construction, £12,812 10s.; Bolckow, Vaughan, and Company, track rails and fastenings of high silicon steel (Sandberg process), £25,071 15s.; Bolckow, Vaughan, and Company, special track rails, renewable guards, and fastenings of high silicon steel (Sandberg process), £17,476 10s.; Holt and Willetts, overhead travelling crane for Shoreditch sub-station, £285; J. Spencer and Company, overhead travelling crane for permanent way depot at Leven Road, Poplar, £72; Millars' Timber and Trading Company and William Griffiths and Company, Jarrah wood paving blocks for tramway tracks, and Burt, Boulton, and Haywood, and W. W. Howard Brothers and Company, creosoted deal paving blocks for tramway tracks, total value about £8,831; Fry Brothers, twelve months' supply of Guernsey granite setts for use in the tramway department, approximate amount, £3,709; Electro-Mechanical Brake Company, 30 car sets of unbreakable grid rheostats, £8 5s. a set, less 2½ per cent. discount; W. and G. Cannon and Sons, heating apparatus for Poplar permanent way depot; Bullers, Limited, supply of track insulators; Leeds Engineering and Hydraulic Company, two hydraulic accumulators and a pump for the third section of the central car repair depot, £206; British Insulated and Helsby Cables, supply during 1913-14 of copper bonds; Alfred Blackmore and Company, 30,000 tons of Yorkshire nuts, at the basis price per ton of 15s. 8d.; Gardner, Locket, and Hinton, 60,000 tons of Scotch washed singles, at 15s. 8½d. per ton; Wm. Cory and Sons, 70,000 tons of Scotch washed single nuts, at 15s. 10d.; iron castings for permanent way during the year ending April 30, 1914; T. Butlin and Company, £2,955; J. Crowley, £32; S. Griffiths, £123; J. Martin and Son, £2,627. For the supply of miscellaneous tramway parts and equipment for the year ended April 30 next: British Westinghouse Electric and Manufacturing Company, Dick, Kerr, and Company, Morgan Crucible Company, Liverpool Electric Cable Company, J. G. Ingram and Son, Crystalate Manufacturing Company, Bullers, Limited, Anti-Attrition Metal Company, F. W. Rowlands and Company, Carron Company, T. Summerson and Sons, Brightside Foundry and Engineering Company, J. Williamson and Company, J. Crowley and Company, Brydon and Company, S. Peace and Sons, and Hadfield's Steel Foundry Company. Existing contracts with the Morgan Crucible Company, the Sloan Electrical Company, and William Geipel and Company for the supply of carbon traction motor and other brushes for electrical machinery have been extended for a year. Stores for the year ending April 30, 1914: Steel and iron castings for permanent way depot for the tramway department, Edgar Allen and Company, £1,568, R. Hyde and Son, £338, National Steel Foundry, Limited, £860; enamelled iron sign plates for the tramway department, Falkirk Iron Company, £36; foundations for power turning lathes for the third section of the central car repair depot, J. and C. Bowyer, £535; Western Electric Company, high and low-tension electric cables, £25,409 16s. 8d.; Hadfield's Steel Foundry Company, steel and iron castings for permanent way during the year ending April 30, 1914, £144.

## FINANCIAL REPORTS.

**Bombay Tramways Dividend.**—The directors recommend a dividend of 5 per cent. on the ordinary shares for the year ended December 31, an increase of 2 per cent. over 1911.

**Mexico Tramways Company.**—The net revenue for 1912 amounted to 1,830,480 dols., and 786,566 dols. was brought forward. Four quarterly dividends at the rate of 7 per cent. per annum have been paid, leaving 1,462,928·51 dols. to be carried forward.

**Hull Corporation Tramways.**—The accounts for the year ended March 31 show that the total revenue was £158,441 (including £157,048 traffic revenue), and net working expenses £111,564. Of the net balance of £13,435, £12,000 has been devoted to relief of rates and £435 transferred to reserve fund. Traffic revenue per car-mile was 9·33d.; working expenses, including power, were 6·63d.

**Aberdeen Corporation Tramways.**—During the year ended May 31 the tramway receipts amounted to £80,150, an increase of £2,974 compared with the previous year. The number of passengers carried was 18,766,856, as against 18,096,938. The miles run numbered 1,738,966, compared with 1,643,242. For the past three years the receipts show an aggregate increase of £9,029. The P-A-Y-E cars on the Woodside route continue to meet with success, the receipts on this section showing an increase of £153 from their inauguration on April 28 up to May 31.

**Burnley Corporation Tramways.**—The past year at Burnley has been the most successful on record. The total revenue amounted to £79,890, as compared with £72,709. The increase is attributed to popularity of the service and to good trade. The increased number of top-covered cars has been much appreciated. The working expenses were £49,430, as compared with £45,455. The increase is explained by additional mileage, higher wages, and increased cost of materials. Interest on capital required £6,474; sinking fund, £6,491; rent of tramways, £2,061; income tax, £893; to the reserve fund was allocated £5,791; while £8,750 was paid to the borough fund as profit. The total revenue per car-mile was 13 22d., as compared with 12·61d.; and the average working expenses 8·183d., as compared with 7·895d. Owing to the judgment in favour of tramways being given the same allowance as railways, there has been a substantial saving in the payment of rates as compared with last year. An attempt is being made to develop the heavy parcel traffic by the goods wagon illustrated in our issue of December 12, 1912, and the results give fair promise of success.

**A Compliment to the Brighton Management.**—In moving the adoption of the general manager's annual report, Alderman Wilson, chairman of the Tramways Committee, said that if they had asked him four years ago whether the tramways would be on the rates by this time, he would have said they would be. They were certainly doing a great deal better than any of them had expected five or six years ago. One disadvantage the system was suffering from now was the cost of renewals and track. That would continue, and the committee proposed to spend as far as possible the whole of their balance. They did not propose to put any more to the actual reserve fund until they had renewed the whole or the greater part of the tramway. The committee's report showed that there was a net profit of £931 after meeting interest and sinking fund charges. The total revenue for the year was £53 798, against £54,027 in 1911-12. The working expenses, which include the whole cost of the renewals, amounted to £39,506, a decrease of £1,554. The tramways were last year assessed as light railways for the district rate, paying one-fourth, the poor rate remaining the same.

**Nottingham Corporation Tramways.**—The report of Mr. J. Aldworth, tramways manager and electrical engineer, for 1912-13, shows that the receipts, exclusive of interest on investments, amounted to £167,160, an increase of £4,562. The increase arising from the falling of two Easters in the financial year was about equalised by there being one working day less, the previous year being leap year. The working expenses amounted to £108,274, an increase of £2,111, leaving a balance of £58,886. The balance has been appropriated as follows: Interest on stock and loans, £14,349; repayment of capital, £19,762; in aid of general district rate, £19,000; reserve and renewals fund, £4,775; part cost of removal of centre poles, £1,000. The increase in expenditure is attributed to the addition of £1,340 in the wages of the traffic staff, and an increase of £554 in traffic expenses, including the cost of route numbers and ticket boxes fitted to the cars. There was a saving in the consumption of electric energy, which averaged 1·65 units, or 2·06d. per mile. The maintenance charges amounted to £18,683. Of this £8,517 was expended on cars, £1,305 on the overhead electrical equipment, and £8,161 on the permanent way. The average receipts per car-mile were 11·50d. (as compared with 11·22d.), the average working expenses 7·45d. (7·32d.) and the percentage of expenses to receipts 64·19 (65·29).

**Sheffield Corporation Tramways.**—During the year ended March 25, 96,330,242 passengers were carried, and the tramway receipts were £361,845, which, with motor omnibus receipts, made a total of £362,128, an increase of £21,137 on the previous year. The total working expenses of the cars were £207,690, and those of the omnibuses £134; leaving net revenue or gross profits at £154,303. After payment of interest, income tax, and other charges, there is a balance of £77,296 (an increase of £8,561), and of this £30,234 is appropriated for the general district rate. Since 1896, out of profits £237,084 has been voted in relief of the district rate. The expenditure on renewals of permanent way was £27,059. The undertaking has been maintained in efficient working order, no less than £49,390 having been spent out of income in general repairs and maintenance during the year. The car-miles run totalled 8,071,188, as against 7,720,026; passengers carried, 96,330,242, as against 90,458,851; percentage of working expenses to ordinary income, 57·389, as against 57·655; average total revenue per car-mile, 10·760d., against 10·698d.; average fare per mile, ·386d., as against ·416d.; average journeys per head of population per annum, 206·536, against 198·465; number of service cars in stock, 279, against 269; amount of sinking fund applied in reduction of debt, £341,370, against £301,508.

**J. G. White and Company.**—Lord Arthur Butler presided at the ordinary general meeting of J. G. White and Company, Limited, at the Cannon Street Hotel, on June 26, and in moving the adoption of the report, said there was a net profit for the year of £88,797, an increase of £1,691 over last year's figure, and, with the exception of 1911, the year under review was the most successful in the history of the company. After making substantial additions to the reserve accounts, the directors recommended dividends at the same rate as for the past two years. Investments, now standing at £163,728, were about £32,000 less than last year, which was due to the sale of certain securities at a substantial profit. Their most important investment was the Municipal and General Securities Company, which was doing an increasing and successful financial business, and had paid dividends of 10 per cent. on its capital after making liberal allocations to reserves. It was considered highly probable that next year their investment account would show a higher figure than at present. The report was adopted unanimously, and dividends were ordered to be paid as follow: Six per cent. on the cumulative preferred shares for the half-year to February 28 (making 12 per cent. for the year), 6 per cent. on the ordinary shares (making 12 per cent. for the year); and an extra dividend of 10s. per share on the ordinary capital for the year, making a total of 62 per cent. on the ordinary shares.

**Wolverhampton Corporation Tramways.**—The results of the Wolverhampton surface-contact tramways show that a well-designed system carefully maintained will give very satisfactory results. Last year's working has been very successful, and the manager, Mr. W. A. Luntley may be congratulated on the result. The net profit, after paying all capital and sinking fund charges and income tax, amounted to £12,021, on the tramways, and including the profit of £307 from the motor chars-a-bancs service, there is a surplus of £12,328. The Tramways Committee have contributed £3,777 towards the rates, equivalent to 2¼d. in the £, and have raised the reserve and renewal fund to £50,220. The total traffic receipts, which amounted to £53,963, as compared with £51,452, constitute a record. Working expenses amounted to £30,528, as compared with £29,648; percentage of working expenses to total revenue 55 75, as compared with 56·73; average traffic revenue per car-mile 11·086d., and total working expenses 9·53d. The average consumption of energy amounted to 1·388 units per car-mile. There are 49 cars, and the length of track is 21 miles 40 chains. The increase in expenses is due to the extra cost of material and to concessions to employees. The motor chars-a-bancs service is giving good results. The working costs, including depreciation, amounted to 8·107d. per mile, a very creditable result.

**Bradford Corporation Tramways.**—The extension of the period during which halfpenny fare facilities are given is stated to be mainly responsible for the reduction in the net profit on the tramway undertaking in the city treasurer's balance sheet for the year ended March 31. The net profits amounted to £41,921, as compared with £52,782 for the preceding year. The traffic income (£279,524) showed an increase of £6,044, but as there had been an increase in the mileage run amounting to 271,000 car-miles the income per car-mile worked out at a lower figure than in the previous year—11·3d. as compared with 11·6d. Wages of drivers and conductors accounted for an increase of £4,456, of which £2,000 was in respect of advances in wages and £2,500 in respect of increased staff consequent on the additional mileage. £12,800 was paid in rates—£1,300 more. Repairs and maintenance cost £42,900, an increase of £7,000. Electric power cost £46,000, the larger mileage run being responsible for an increase of £2,000. Per car-mile the cost of power worked out at 1¾d. From the parcels department there was an income of £9,500, an increase on the year of £1,200. The profit (£1,067) showed an improvement on the year of £136. As a whole the undertaking made a gross profit of £98,617. From this there had been paid as interest on loans £24,770, and £31,926 had been set aside for sinking fund purposes, leaving a net profit of £41,921, which had been carried to the reserve and renewal account. This account had to its credit at the beginning of the year £75,120, and after payment of £9,000 in relief of rates and £19,000 for renewal of permanent way the account at the end of the year stood at

Digitized by Google

£89,000. From this sum the Council had voted in relief of rates a sum of £17,000.

**The Imperial Tramways Company.**—The directors report that the scheme of arrangement which was approved by both classes of shareholders, has received the sanction of the High Court. Accordingly, the arrears of dividend on the preference shares to December 31, 1911, have been cancelled, and ordinary shareholders have relinquished their exclusive rights in the ordinary shares dividend fund, which will in future form part of the dividends equalisation fund applicable to maintenance of dividends on both preference and ordinary capital. The investment in the London United Company has been written down, and the sum of £85,000 has been transferred from the reserve fund for renewals and contingencies for that purpose, leaving the present amount of the reserve funds at £65,122. The directors state that, in their opinion, the shareholders may now look for the regular payment of preference dividend and the maintenance of at least 4 per cent. on ordinary share capital. The revenue account shows an available amount of £24,255, and after payment of interest on debenture stock for the whole year there is a balance, including £7,678 brought forward, of £19,221, which the directors recommend should be appropriated as follows: Dividend at 6 per cent. for the year on preference capital (less income tax), £11,300; dividend at 4 per cent. for the year on ordinary capital (less income tax), £7,533; and to carry forward £388. A portion of the investment in the London United Tramways, Limited, has been disposed of, 20,000 shares out of the 44,446 £10 preference shares having been sold. The permanent way of the Middlesbrough, Stockton, and Thornaby tramways has been further renewed, so that two-thirds of the track has been relaid. The reconstruction of the remainder will probably be completed this summer.

**Glasgow Corporation Tramways.**—The Finance Sub-committee of the Tramways Committee on June 9 approved of the financial statement of the tramways department for the year ended May 31. For the first time the revenue has reached a million sterling. During the past twelve months the extended halfpenny distance has been in full operation, and 191,944,261 passengers have been carried at this fare. In addition to the 121,212,468 carried in the year ended May 31, 1912, over this extended distance there were 9,062,479 carried on the first two-stage and 9,058,682 on the second two-stage of the former two-stage ticket system. Subjoined are the details of the statement:

REVENUE.

| Surplus to be handed over to Common Good ... ... ... ... ... ... | 33,003 0 4 | 52,067 10 9 |
| | £450,827 17 2 | £458,207 5 1 |

On the expenditure side the following increases were reported: Wages of motormen and conductors, £6,190; wages of cleaners, £3,145; local rates, £7,615; maintenance of track, £17,207; fuel for Pinkston, £2,826; interest on capital, £6,681; sinking fund, £3,214; and renewal and depreciation, £2,053; total, £48,931. On the revenue side the ordinary receipts show an increase of £20,468, and the interest on investments shows an increase of £8,859, which makes a total increase of £29,327. Deducting this sum from the above excess of expenditure of £48,931, a sum of a little over £19,000 is obtained, which represents the decrease in the surplus as compared with the surplus of the year 1911-12.

## PERSONAL.

**Inspector Howard,** of the Ashton Council Tramways, has been appointed to the position of chief inspector.

**Mr. T. R. Whitehead,** engineer and manager, Coventry Corporation tramways, has had his salary increased from £400 to £450.

**Mr. P. W. Bancroft,** chief clerk in the tramways department at Derby, has had his salary increased from £130 to £156 per annum.

**Mr. T. S. Field,** resident engineer to the Blackpool Corporation Tramways, has been voted an increase of £26 to his salary of £182.

**Mr. W. M. Arnot** has resigned his position as Australian manager for Siemens Brothers Dynamo Works, Limited, and intends to visit London at an early date.

**Scholey and Company, Limited.**—Mr. M. N. Jacks, director of Messrs. Humphreys, Limited, and Mr. J. Norman Ambler have joined the board of Messrs. Scholey and Company, Limited.

**Mr. W. H. Stradling,** an official of the London United Tramways, has resigned his appointment after eleven years' service, and on June 23 was the recipient of several handsome presents from the staff.

**Mr. W. Rutherford,** managing director of Dick, Kerr and Company, Limited, has been appointed a director of the Edinburgh and District Tramways Company to fill the vacancy created by the retirement of Sir Robert Maule.

**Dean Welldon,** of Manchester, is throwing open the grounds of the Deanery every Sunday afternoon for three months from 4 p.m to 6 p.m. to Manchester and Salford tramwaymen and their families. Tea is served on the lawn.

**Mr. W. Stone** has been appointed chief electrical engineer of the Victorian State Railways, and will take charge of the work of electrification of the Melbourne suburban lines in association with an expert to be sent out by Mr. C. H. Merz.

**Mr. Cyril Clarke,** principal assistant in the tramways department at Birkenhead, has been appointed acting tramways manager until the end of the year. An amendment in favour of advertising for a manager was defeated, only six members of the Council supporting it.

**Mr. W. C. Murray,** traffic inspector, who has been associated with the New South Wales tramway department since its inception in 1880, is retiring after 33 years' service. Since 1889 he has been at Newcastle. He has been granted four months' extended leave from April 13.

**Mr. W. P. Burton,** who has been invited by Sir Thomas Lipton to command the new America Cup Challenger, is the vice-chairman of the Ipswich Electric Supply and Tramways Committee. He is also the Master of the East Suffolk Foxhounds and Master of the Staghounds.

**Mr. G. W. Humphreys,** chief engineer to the London County Council, has been nominated as a representative of the Council on the Engineering Standards Committee, in the place of Sir M. Fitzmaurice, late chief engineer, who has resigned his membership.

**Mr. P. R. Collings,** of the cashier's office, Portsmouth Corporation Tramways, has been presented with a case of cutlery and carvers on the occasion of his marriage. Messrs. Cook, Trowbridge, and Gordon Bailey spoke on behalf of the cashiers, inspectors, and other municipal departments.

**Messrs. J. M. McElroy and H. Mattinson,** general manager and permanent way engineer respectively of the Manchester tramways, who on May 17 left England on a visit to America to study tramways and transportation methods, returned to Manchester during the first week in July.

**Mr. S. T. Allen,** the new borough electrical engineer and manager of the Wolverhampton electricity department, has been presented with a gold watch and an oxidised silver inkstand by his late colleagues and a number of members of Carlisle Corporation. The Mayor, in handing the gifts to Mr. Allen, observed that he had transformed the electrical undertaking into a profitable one.

**Ilford Traffic Superintendent.**—On the ground of economy Ilford Urban Council in February last decided that the post of traffic superintendent in the tramways department should be abolished. On June 10, on the recommendation of the Tramways Committee, the authority rescinded the resolution, and decided that Mr. Woolstencroft should retain the position at a salary of £156.

**Dinner to Colonel Sir A. Yorke.**—It has been arranged by the two Tramway Associations to give a complimentary dinner to Colonel Sir Arthur Yorke, K.C.B., on the occasion of his retirement from the Board of Trade in July. The dinner will be held in the Savoy Hotel, London, on July 18, when the chair will be taken by Viscount Chilston, president of the Tramways and Light Railways Association.

**Mr. R. S. Pilcher,** general manager, Aberdeen Corporation Tramways, is recommended by the Tramways Committee for an increase of his salary from £400 to £450, with another increase of £50 in two

Digitized by Google

annual increments of £25, bringing the total salary to £500. The committee expressed appreciation of the efficient services given by Mr. Pilcher, and they recognised the economies he had effected and the good condition of the rolling stock and property of the department.

**Mr. H. M. Sayers,** who was cordially welcomed by many friends at the Congress of the Tramways and Light Railway Association, is in England for a few weeks' holiday. Since he went out to Santos, Brazil, as chief electrical engineer of the City of Santos Improvements Company, Limited, many important extensions and improvements have been carried out, and the work was often undertaken at high pressure under conditions that constituted a heavy tax upon those concerned Mr. Sayers returns, however, in excellent health.

**London County Council Central Car Repair Depot Superintendency.**—Fifty-eight applications were received by the London County Council in response to an advertisement for a superintendent of the central car repair depot, at £300 a year. After examining the applications and testimonials and interviewing several of the candidates the committee were of opinion that is was not desirable that a permanent appointment should be made at the present time. They had accordingly decided that a superintendent should be appointed temporarily, and the chief officer of tramways proposed to engage one of the candidates.

**Mr. A. O. Kolkhorst,** who has entered into partnership with Mr. R. W. Weekes, Maxwell House, Arundel Street, Strand, W.C., recently returned from Chili, where for three years he was general manager of the Chilian Electric Tramways and Light Company, Santiago, and at the same time general manager of the Valparaiso Electric Tramways and Light Company. The whole of the electric tramways in Valparaiso and the lighting and power plants were carried out under his direction and supervision, and he had continuous control of this undertaking from 1903 to 1912. The capital outlay on these schemes was £3,500,000.

**Mr. J. B. Hamilton,** general manager of the Leeds Corporation Tramways, was stated in a report presented by the Tramways Committee to the City Council to have been granted permission by Alderman Tetley, the chairman of the committee, to render assistance to Southport, West Bromwich, Nottingham, and the London County Council in connection with applications for Parliamentary powers. A councillor rose to discuss this matter, but Alderman Willey stated that Mr. Hamilton's agreement provided for work of this kind being undertaken by him, after permission by the chairman. The town clerk upheld this statement, and added that the conduct of the chairman in giving permission could not be discussed.

**Mr. J. McKellar,** who read a paper on the Newcastle-on-Tyne tramway extensions at a recent meeting of the Municipal and County Engineers' Institute, was first engaged in the municipal engineers' department at Paisley, where he was articled. In 1897 he entered the service of the Glasgow Corporation, and was engaged on the construction of 40 miles of electric tramways, and also on the erection of the Pinkston power-station. Mr. McKellar became chief assistant to the resident engineer of the Newcastle tramways in 1900, and was afterwards transferred to the staff of the city engineer, being subsequently engaged on various tramways and other works in Newcastle, including many Parliamentary schemes.

**Mr. A. A. Day's** resignation of the appointments of tramways manager and electrical engineer at Bolton was accepted by the Town Council on June 7. Alderman Miles, chairman of the Tramways Committee, said if he ventured the opinion that Mr. Day's serious illness had been brought about through an excessive anxiety and study in carrying out his work he would not be far wrong. Mr. Day practically took no recreation, for which Alderman Miles was sorry, because if he had this would perhaps not have happened. Alderman Nicholson remarked that it was lamentable that on the eve of commencing a big undertaking on which Mr. Day had been engaged night and day for a long time he should be struck down. Mr. Day was formerly chief assistant electrical engineer of Manchester, and succeeded Mr. Ellis, now of Cardiff, as Bolton borough electrical engineer in 1900. He was appointed tramways manager in 1904. The salaries for the dual positions amount to £750 per annum.

**Tramway Committeemen** who are also associated with the general electrical undertakings of their respective Corporations, have had a busy time recently. Aldermen F. Smith and Major Clarke, who are respectively chairman and vice-chairman of the Liverpool Electricity and Tramways Committee, and take a deep interest in the working of the departments for which the committee are responsible, attended the congress of the Tramways and Light Railways Association, at Blackpool, and the following week they devoted to the Municipal Electrical Association. In brief intervals they were able to attend various local conferences and committee meetings at Liverpool Both are strongly of opinion that associations such as those referred to are of much value, not only to industry at large, but particularly to members of Councils, who have to decide on important matters of policy involved in new departures.

**A Presentation at Newcastle.**—Councillor Rodgers, chairman of the Tramways Committee, at the opening of Heaton extension of the city tramways, was presented by the Lord Mayor (Ald. Weidner), on behalf of the Tramways Committee, with a souvenir of the event in the form of a handsome gold watch and chain. His lordship, who was the pioneer of the movement for municipalising the tramways, paid a tribute to the work of the first chairman, Ald. Cail, and of his successor, Ald. Sir Joseph Ellis Following Sir Joseph, Mr. Rodgers had proved himself to be a valuable asset. The Lord Mayor also complimented Mr. Ernest Hatton, the general manager, and the staff on their work. Sir Joseph Ellis proposed the health of the Lord Mayor, with a tribute to the work done by Councillor Mayne, the vice-chairman, and Mr. Hatton, the manager. The tramways had done something to make the lives of the citizens brighter and happier. In thanking the members for the presentation, Councillor Rodgers remarked that the usual recognition of the services of a public man was satire, sneers, and criticism; but he was glad to see that for once in a way public labours had been appreciated.

**Mr. W. Wyld,** late borough electrical engineer and tramways manager at Birkenhead, and now electrical engineer to Hampstead Council, has been presented by the Birkenhead tramway staff and employees with a silver tea service, with tray, as a token of their esteem. Mr. J. Dudleston (traffic superintendent) presided, and said there was a unanimous wish that some suitable recognition should be made by the staff of the gentlemanly and courteous treatment they had always received from him. The fact that over two hundred were present was an indication of his fair dealing with the men. Mr. Chadwick (rolling stock superintendent), Inspector Godding, Mr. J. Gunn (on behalf of the Tramway Workers' Association), Conductor Wallace, Mr. S. Edge, Mr. Evans (shedmen), and others testified to the esteem in which Mr. Wyld was held. Mr. Gunn observing that there were times when they had thought they had been hardly punished, but they could not fail to come to the conclusion that Mr. Wyld had dealt fairly and squarely with them. Mr. Cyril Clarke, the newly-appointed manager, handed the tea service to Mr. Wyld, and referred to his many kindly acts, which had been performed in a most unostentatious manner. Mr. Wyld, in reply, thanked the staff and employees for their kindness, and said that after he appeared before the Hampstead Electricity Committee one of the members remarked to him that he had heard he was not a slave-driver. He never had been a slave-driver, and he never would be. He had always found that the best work was done by men who were asked to do it in a proper manner. It only remained for them to stand by Mr. Clarke as they had stood by him, and the continued success of the tramways was assured. From the employees of the electricity department, Mr. Wyld has received a barometer, Mr. Shallcross, the electrical engineer, making the presentation. The chief officers of the Corporation gave their late colleague a silver salver.

**Mr. H. E. Blain** has entered upon his appointment at the head office of the London Underground Railways. It is understood that among other duties, Mr. Blain will deal with the purchase of material and supplies, a department which, in view of rapidly increasing demands, is becoming one of very great importance to the undertaking. In accepting with regret his resignation as manager of the West Ham Corporation Tramways, the Tramways Committee wished him every success and prosperity in his future career. Mr. Blain went to West Ham from Liverpool in 1903, and organised the tramways. In order to place on permanent record the Council's high appreciation of Mr. Blain's work, not only in connection with his 10 years' management of the West Ham tramways undertaking, but also in connection with municipal tramways throughout the United Kingdom, a testimonial on vellum, under the Corporate seal, is to be presented to him. At the June meeting of the Council, Alderman Littler, chairman of the committee, spoke in eulogistic terms of Mr. Blain's work, and the manner in which he had suppressed the bogus accident claim-mongers. He had built up a bureau of information with regard to this type of individual, which had been most useful to the whole of the tramway systems in that neighbourhood. It was also very largely due to the energy of Mr. Blain that they owed the inter-running arrangements between West Ham and the London and other surrounding authorities. —On appearing for the last time to support a number of tramway summonses at West Ham Police Court, Mr. Blain expressed to Mr. R. A. Gillespie, the stipendiary magistrate, his thanks for the courtesy and consideration he had received at his worship's hands during a term of nearly 10 years. Mr. Gillespie replied that he was sorry to hear they were going to lose Mr. Blain. They had always met in a perfectly friendly and cordial manner, and he hoped that he would get on equally well with Mr. Blain's successor.—On July 4 Mr. Blain was entertained to dinner by the members of the Metropolitan Association of Electric Tramway Managers. Mr. Blain has always taken a deep interest in the affairs of the Municipal Tramways Association, of which he was president in 1912, when one of the Association's most successful Conferences was held in London.

## TRAMWAY AND LIGHT RAILWAY NOTES.

**BIRMINGHAM.**—Consideration was given on July 1 by Birmingham Corporation to the Tramways Committee's scheme for the linking up of the various tramway routes by means of lines through the central area of the city. The scheme was divided into 13 sections. Two parts met with the disapproval of the majority of the members, the proposal to link up Broad Street with Colmore Row *via* Victoria Square being referred back to the Tramways Committee to prepare a scheme that will avoid Victoria Square, and the suggestion to connect Navigation Street with Corporation Street *via* Stephenson Street being rejected by a large majority. All the other proposals, including that for a double line of tramways along Broad Street, were approved. Councillor Harrison Barrow, chairman of the committee, emphasised the dislike the public had to being taken round back-street routes. A minute or two, he said, made a great deal of difference to people travelling on the cars, and as they had found in the case of the Ladywood terminus, often turned profit into loss. Councillors Neville Chamberlain and Combridge, the chief opponents, urged that the tramways could only go on making money whilst they had a monopoly of the routes. Their only security was whether the Watch Committee would or would not give competitors powers to run along the streets. Councillor Harrison Barrow declined to enter into a discussion on the merits of motor 'buses and tramways, but pointed out that the returns of the London General Omnibus Company for the six months ended December 31 showed that their expenses ratio had gone up from 81 per cent. to 92 per cent., so that the motor omnibuses were not having it all their own way in London.

**BURNLEY.**—It has been decided to remove the centre poles and to substitute wire suspension with side poles, in accordance with the practice on other tramways. The work will be proceeded with as soon as convenient. During the past year 456 hammered joints have been filled in by the oxy-hydrogen process at an average cost of 13s. 6d. per joint. The work has been done during the night, and so far appears, the general manager states, to offer a satisfactory solution of a common difficulty.

**LONDON.**—At the suggestion of the Highways Committee the County Council have withdrawn the railless trolley car proposals from the Council's Tramways Bill, in consequence of the House of Commons having adopted an instruction to the Committee on the bill to insert a provision making the erection of the overhead equipment subject to the provisions of section 23 of the London County Tramways (Electrical Power) Act of 1900. That section provided that the Council should not apply the overhead system of traction to tramways without the consent of the road authority. The Highways Committee propose to reconsider the whole matter and report further.—The West London stipendiary magistrate on May 22 dismissed a summons preferred by the police against a tramcar driver for failing to bring his car to a standstill to avoid impending danger. The magistrate was of opinion that the case ought not to have been brought forward, and he awarded a guinea costs. Reporting on the matter on June 10, the Highways Committee said this was the first occasion on which the Council had been successful in obtaining costs against the police. Since January 1 last 19 summonses out of a total of 29 taken out by the police against the Council's motormen for failing to stop to avoid impending danger, endangering the safety of persons, causing hurt, and wanton and negligent driving had been dismissed.—By 2,339 votes to 1,210 the tramway employees of the County Council have agreed to amendments of the regulations governing the conciliation board. Under the amended rules, which were put forward on behalf of the employees, the central board comes to an end, but four boards for various grades will be continued.

**MANCHESTER.**—Under the latest linking up of the tramways on the south side of the city, it is possible to journey from Piccadilly to the Palatine Road terminus and return to the city by circular route along the new Burton Road, Barlow Moor Road route, past the Southern Cemetery, and then by way of Chorlton, Brook's Bar, and the city, this being in all a ten miles circular route. Along Slade Lane as far as West Point a new track is being laid, and in time it will continue along Moseley Road and Wilbraham Road, to Chorlton. By the completion of that route it will be possible to reach Chorlton by car from four different directions.

**NEWCASTLE-ON-TYNE.**—The opening took place on June 6 of the extension of the tramways from Jesmond Road to the Heaton terminus of the Tyneside Tramways Company. The Lord Mayor (Ald. Weidner) said he felt assured that the latest additions to the magnificent service that they already enjoyed would maintain its high standard. The tramways had developed the outlying districts, and the relief afforded to the rates had not been at the expense of adequate provision for contingencies. Councillor Rodgers, chairman of the Tramways Committee, stated that last year they carried 52,204,974 people, the whole population of Newcastle 209 times in the year, or four times in the week. No other town but Glasgow, with its congested population, did better. The fare per passenger was only a penny and a fraction. As an example of the profits of running through services, he said the extension of the Benwell service increased returns from £280 per week to £380 and required two more cars.

**OXFORD.**—Sir Alex. Kennedy has reported to Oxford Council that he sees no reason why the National Electric Construction Company's scheme for running petrol-electric cars in the centre of the city and on Magdala Bridge, in conjunction with cars elsewhere on the overhead system, should not work satisfactorily. The Tramways Committee have been requested by the Council to report on the matter before July 13.

**WEST BROMWICH.**—An attempt by the Home Office to place their London fetters upon a provincial tramway has been defeated. If there is one cause of complaint more than another among tramway passengers in boroughs situated in the outer districts of London, it is that they have to journey to Scotland Yard to recover any article they leave in the cars if it has been removed from a tramway depôt. When the West Bromwich Corporation Bill was before a Committee of the House of Commons in June, the Home Office raised objections to the proposal to establish a lost property office in connection with the tramways, and to have a sale once in six months for the disposal of such property as had not been claimed. The Committee, however, concluded that such a provision was a reasonable one, and likely to be of general advantage. The clause was therefore agreed to.

## PATENT LIST.

### Specially abstracted for "The Tramway and Railway World" from the Official Journal of Patents.

*** If the inventions have been communicated the names of the communicators are given below in italics.

### APPLICATIONS.

### Applications for Letters Patent have been filed:

12,406 Means for the regulation or control of railway traffic—H. von Kramer.
12,473 Lubrication of the wheels and axles of railway and tramway vehicles—J. Abbott.
12,599 Operation of railway points—A. T. Blackhall and S. Hutt.
12,644 Railway sleepers—J. S. Todd.
12,674 Automatic brake slack adjusters for railway carriages, etc.—Birmingham Railway Carriage and Wagon Company, and E. O. Hill.
12,692 Guards or fenders for motor road vehicles—F. Bloomfield.
12,723 Testing insultation—Evershed and Vignoles, Ltd., and S. Evershed.
12,797 Rail fasteners—S. C. Collins.
12,841 Power transmission and control apparatus on motor vehicles—J. G. P. Thomas and Thomas Transmission, Ltd.
12,863 Life-guards for the front of motor vehicles—E. Hall.
12,885 Device for securing rails to ties—E. J. Rosencrans and H. Sanderson.
12,923 Wheel guards and obstruction removers for mechanically propelled road vehicles—M. van Gelder.
12,954 Life-guard for mechanically propelled vehicles—W. J. Palmer.
12,973 Guards for motor-driven vehicles—A. F. Davis.
13,022 Life-guard for motor road vehicles—J. Swift and E. Swift.
13,064 Electric railway signal relay to be operated by alternating currents—A. H. Johnson and W. J. Thorrowgood.
13,078 Automatically reversing overhead collector for electric trains—P. Alexander and R. F. Stedman.
13,093 Safety device and signals for electric cars, motor omnibuses, etc.—E. G. H. Pyle and H. Pyle.
13,135 Dynamic brakes—J. Klinkenberg.
13,147 Wheel guard—C. Lewin.
13,154 Life-saving guard for motor vehicles—D. Maggiora.
13,166 Obstruction remover and wheel guard—C. B. Voisey.
13,202 Railway signalling devices—E. Day and P. Kühn.
13,242 and 13,243 Electrical train-control system—W. B. Murray.
13,278 Life-guard—D. Sullivan.
13,392 Life-guard for motor traffic—G. P. Abrahams.
13,396 Railway crossing—M. E. Harrison.
13,421 Device for securing railroad rails to ties—E. J. Rosencrans and H. Sanderson.
13,428 Trolley heads for electrically-propelled vehicles—J. T. Mayor.
13,495 Safety guards for motor omnibuses—A. W. Gamlen.
13,548 Axle trucks for railway and tramway vehicles—E. Peckham and S. Thomas.
13,564 Life-saving catcher for trams, cars, etc., tracked or trackless—C. Yeoman.
13,656 Systems of electrical distribution—British Thomson-Houston Co., Ltd. (*General Electric Co.*)
13,886 Apparatus for removing obstruction and preventing accident or loss of life by electric trams and railways, etc.—W. T. Harper.
13,820 Electrical connection devices for railway vehicles—L. Boirault.
13,821 Life-guards for self-propelled road vehicles—F. C. Andrew.
13,832 Railway train brakes and signalling—A. G. Taylor and F. Herbert.
13,868 Life-guard for motor omnibuses—F. H. Parker and J. Malam.
13,872 Life-saving guards for motor vehicles—J. Watt and H. P. Patten.
13,887 Speed controllers—T. Douglas.
13,943 Electrical conductors—F. Eastwood.
13,958 Motor fuel economiser—A. Gibbs.
13,972 Guards for motor vehicles—W. Jones.
14,001 Fluid pressure brakes—W. V. Turner and P. H. Donovan.
14,002 Fluid pressure braking apparatus—W. V. Turner.
14,012 Method of forming parallel faces on the ends of rails and other objects to be butt welded—Th. Goldschmidt Akt. Ges.
14,020 Double-decked cars for railways and tramways—L. Spangler.
14,024 Rail joints—O. Allen, Junr.
14,039 Bogie truck for railway carriages—F. H. Addis.
14,047 Life-guards for road vehicles—R. Garret.
14,104 Life-guards for motor omnibuses—W. E. Cocks.
14,177 Apparatus for preventing the overrunning of signals by railway trains—H. G. Wainscott, E. Wainscott, T. Mahon, and S. Yates.
14,200 Life-saving guard for motor omnibuses—P. Beston.
14,202 Motor vehicle life-guard—S. A. Goss.
14,243 Mounting motors on electric tramcars or other rail carriages to prevent side swing—I. Bulfin.

**E. GREEN & SON, LTD., WAKEFIELD.**

14,336 Automatic train stop device—A. E. Hudson.
14,349 Life-guard for motor omnibuses—E. L. N. Karslake.
14,362 Car coupling—O. Rison.
14,415 Guards for use in connection with motor road vehicles—C. Fenwick.

## Specifications Published.

1912.

2,957 Electrical railway systems—Stuart.
10,417 Railway and tramway systems - Hayward.
21,755 Railway sleepers—Winsall and O'Neill.
10,983 Device for use in displacing rail tracks laterally—Kleber.
14,677 Wedges or keys for railway lines—Reed.
3,828 Railway safe running devices—Angus.
15,509 Adjustable bolster chairs and clamps for the switch blades of railway points—Williams.
17,193 Apparatus for the adjustment of the gauge of rails—Williams.
19,517 Means for operating tramway points -Coulcombe.
33,932 Life-guards for vehicles—Seal.
12,184 Driving gear for mechanically-propelled tramcars—Nelson.
12,329 Axle trucks for railway and tramway vehicles and locomotives—Warner International and Overseas Engineering Co., and Hour.
20,942 Suspension of rail car bodies - Thomas.

1913.

3,588 Railway signalling and apparatus therefor—Stuart.
990 Railway chair keys—Stephenson.
1,080 Automatic couplings for railway vehicles—Paynter.
3,936 Sanding apparatus for railway and tramway vehicles—Cia. Italiana Westinghouse dei Freni.
5,916 Railway safe-running devices—Angus.
5,918 Apparatus for operating and controlling railway point locking devices—Angus.
6,144 Buffers for railway and tramway vehicles—Lofthouse.
506 Street indicators for tramway vehicles—Travers.
4,068 Vehicle brakes—Hostetler.

**Directories of Electric Tramways and Railways** will be found on pages xxv.–xxxiv. of this issue.

One can now spend a day in the streets of London without observing a motor omnibus stationary at the road side waiting for attention from mechanicians. In the old days these would have had to be telephoned for from a distant garage. Nowadays there are garages north, south, east, and west, where motor lorries and a full stock of appliances and parts are kept for remedying defects. The organisation of the London General Omnibus Company in this respect is as typical of progress as is the freedom from breakdowns, and locomotive engineers may find satisfaction in the knowledge that the dual advance has been made under the direction of one of their number who was formerly connected with the London, Brighton, and South Coast Railway, and who for three years has been the omnibus company's chief engineer. On November 14 last we gave a *résumé* of a paper on public service motor vehicles read before the Institution of Automobile Engineers by Mr. T. B. Browne, the president, in which interesting details were given of the steps taken to secure the degree of perfection to which London's motor service has attained. Mr. Browne enlarged upon the subject in a paper which he submitted last month at the summer meeting of the kindred body at New York. Therein we find a reference to the reliability of the vehicles, and a chart showing the percentage of involuntary stops during 1910, 1911, and 1912. The total distance covered by the London vehicles per month now averages over 8,000,000 miles, and the total miles lost from all causes by the "B" type vehicles for March last was 0·136 per cent. of the total possible mileage. The involuntary stops from all causes per 100 miles was 0·012, or 12 stops for every 100,000 miles. Of the remarkable despatch with which the company deals with breakdowns, we were recently a witness in the case of a mishap to a worm-driven back axle at the east end of Tooting Common. In half an hour the breakdown party of five men had arrived from Fulham, and in about another half-hour they had detached the live axle and rear wheels from the chassis and fitted a new axle and pair of wheels. This facility for changing the axle is a feature of the "B" type chassis, and Mr. Browne informed his American audience that the change has been made on the road in 45 minutes. Some points of interest concerning other makes of omnibus were mentioned in the paper. The London General, before starting to manufacture their own chassis, had tried some 32 different kinds of omnibus, and although they do not quite accord with the police requirements for the reduction of weight to $3\frac{1}{2}$ tons, a considerable number of the older vehicles are still running, including 118 De Dions, 60 Straker-Squires, and a number of Leylands. The output capacity of the London General and the Daimler Company is 30 vehicles a week each. Concerning the average running costs of the "B" type, Mr. Browne is of opinion that it is about on a par with that given for the Tilling-Stevens petrol-electric, namely, just over 7d. per mile.

---

One beneficial effect of most of the motor omnibus manufacturers now being indirectly, if not directly, interested in the operating companies is that the days of secrecy as to the cost of operation have passed. The companies making and operating the petrol-electric machine were prompt to recognise the importance of being able to give the fullest information as to running and maintenance costs. The low figures which they are able to show in respect of vehicles running over the country roads of outer London as well as on the smoother surfaces of the central districts have served, conjointly with the advantages claimed for their vehicle, to influence a considerable number of provincial authorities to adopt road motor traction. The recent entry of the chief of the London omnibus companies into the ranks of the sellers is likely to add further to the store of available information, not only as regards their own type of omnibus, but three others that are being run under their auspices. During the present year a number of municipal authorities will complete 12 months' experience of the modern conveyances. The most enthusiastic advocate of motor traction cannot expect the operating costs to be as low as the past costs in the metropolis. The difference between the road surfaces is a bar to such an achievement, and during the current year there has been an advance in the price of petrol. Nevertheless the outlook is hopeful, as witness a reference made to the omnibus department of the Liverpool Corporation Tramways in the report for the year ended March 31 last. Of the two petrol-electric machines put into service at the end of November last it is recorded that they have worked most satisfactorily, that they are operated at a much lower cost, and that they are greatly appreciated by the public owing to their smooth running and comparatively little noise. Omnibuses propelled solely by petrol engines are also showing improved results in the provinces, for the annual report of the Eastbourne Corporation motor omnibus undertaking shows that two Leylands, which are

Digitized by Google

# MOTOR TRAFFIC.

the most recent additions, are maintaining their silence in running and their economy in fuel consumption. Eastbourne is one of the two authorities who have relied solely on the motor omnibus. Like pioneers in most other movements the two Corporations have had to face financial discouragement, but the same can be said for a good many tramway undertakings. However, the convenience to the public has been great, and the Council at the end of 10 years have repaid more than half of the loans and can point to several years in which a net profit has been shown. For the year ended March 31 last, the net profit reached the record sum of £711, the gross profit being £3,724 on an expenditure of £10,337 incurred in the running of 22 vehicles, many of which were second-hand when acquired. While the cost per car-mile is high the receipts are also high, the figures being 14·39d. and 15·16d. respectively. The first-mentioned figures include interest and repayment of loans and instalments on 'buses purchased out of revenue. Notwithstanding the increased cost of fuel the cost per car-mile was exactly the same as in 1911-12, but the receipts improved by more than a penny per car-mile.

---

Reference was made in an article in our issue of June 5 to the need which has arisen for a thorough consideration of the question of liability for road maintenance by everyone concerned in road and rail transportation of passengers and goods. Attention was also drawn to the circumstance that although in the past Committees of the House of Commons had refused to impose against the will of the promoters of railless traction bills any fixed contribution for road maintenance, as they were of opinion that there should be general legislation on the subject, this session the Committees are placing upon companies a contribution of one-third of the extra road maintenance cost incurred in consequence of trolley vehicle traffic, such proportion not to exceed three-eights of a penny per mile run. Municipal traction undertakings providing railless trolley and motor omnibus facilities outside of their own areas are being made liable for one-third of the cost of road widening or of providing footpaths as well as for the extra expense of road maintenance and repair. Failing agreement as to the extra expense, arbitration is to be resorted to at the end of the first year, and subsequently at the expiration of every three years, or any less period as may be agreed upon. For this purpose records are to be kept showing the rates, journeys, and mileage run. If, in view of future legislation, the traction undertakings think fit to apply for the recission or modification of these provisions, they are given liberty to make such application. The House of Commons Committees would have been better advised if they had waited for general legislation and refrained from imposing these liabilities. Several reasons may be advanced for this contention, one being that such burdens are calculated to hamper the provision of railless trolley and motor omnibus facilities. Another objection is that the restrictions referred to cannot be imposed upon companies who run motor omnibuses, as in their case Parliamentary powers are unnecessary. Outside of London it is only necessary to obtain licences for the vehicles from local authorities, and if these are not forthcoming the omnibus company can set down passengers in any street, and provide places on private ground for taking them up. In London licences are obtainable for any number of omnibuses so long as the requirements of the police are met as to the weight and absence of noise. A still greater objection to the keeping of the records imposed by the House of Commons Committees would be apparent if the vehicles were to run through a number of districts, as is the case in London, Birmingham, and their environs. In the Midland city and districts the local authorities are glad enough to accept the facilities offered by the omnibus company without imposing any conditions for road maintenance, for they recognise that traffic facilities are an every day necessity and convenience.

---

The foregoing is the view that the Parliamentary Committees ought to have taken, leaving objecting authorities to make claims before the appointed tribunal for the recovery of damages on the ground of extraordinary traffic. In the event of such proceedings being taken it is certain, from decisions already given in regard to other classes of heavy traffic, that passenger transport would be adjudged to be ordinary traffic. It is to the Road Board that local authorities should look for more liberal aid than they at present receive towards rendering their roads fit to carry motor traffic. This course may be recommended to such bodies as the Epping Rural Council and the Southwark Borough Council. The former are petitioning all the highway authorities in Essex to oppose the London omnibus services to places bordering on Epping Forest, on the ground that the traffic is dangerous to the public owing to the narrowness of the roads, and a great expense to the ratepayers. More sensible views are taken by the Epping Urban Council, who consider that the omnibuses bring a greater amount of trade to the town than they take out, that they do no more harm to the roads than motor cars, and that they are not so dangerous to the public. Southwark Borough Council have passed a resolution requesting the London County Council to insert in their next General Powers Bill a clause enabling any rating authority in the metropolis to charge and recover from the owner or owners of motor omnibuses plying for hire either wholly or partially in the area controlled by such authority a sum equal to such amount in the pound on the annual value of the undertaking in such area (the annual value to be ascertained by a calculation of receipts and expenses of the undertaking in the area) as shall equal the amount of the general rate in the pound imposed from time to time in the locality. The reports of the Southwark Council meeting do not reveal the loose reasoning by which the authority consider it possible for the omnibus companies to give a return of their receipts and expenses in the 29 borough council areas, and it is just this difficulty that would wreck the procedure adopted by the House of Commons Committee if they were so short sighted as to attempt to apply it to any railless trolley or motor omnibus scheme which embraced more than one or two districts. It is to be hoped that this and other aspects will not be lost sight of by the representatives of traction interests when the bills of the present session come up for final reading.

---

Electric Motor Car Run from Scotland to London.—An electrically driven Arrol-Johnston car fitted with an Edison storage battery, on June 9, 10, and 11 ran successfully from Dumfries to London, via Manchester. Thirteen charges were given to the battery during the run of 380 miles. The battery, which weighs 900 lb., is fitted in two portions, one under the bonnet and the other under the seats.

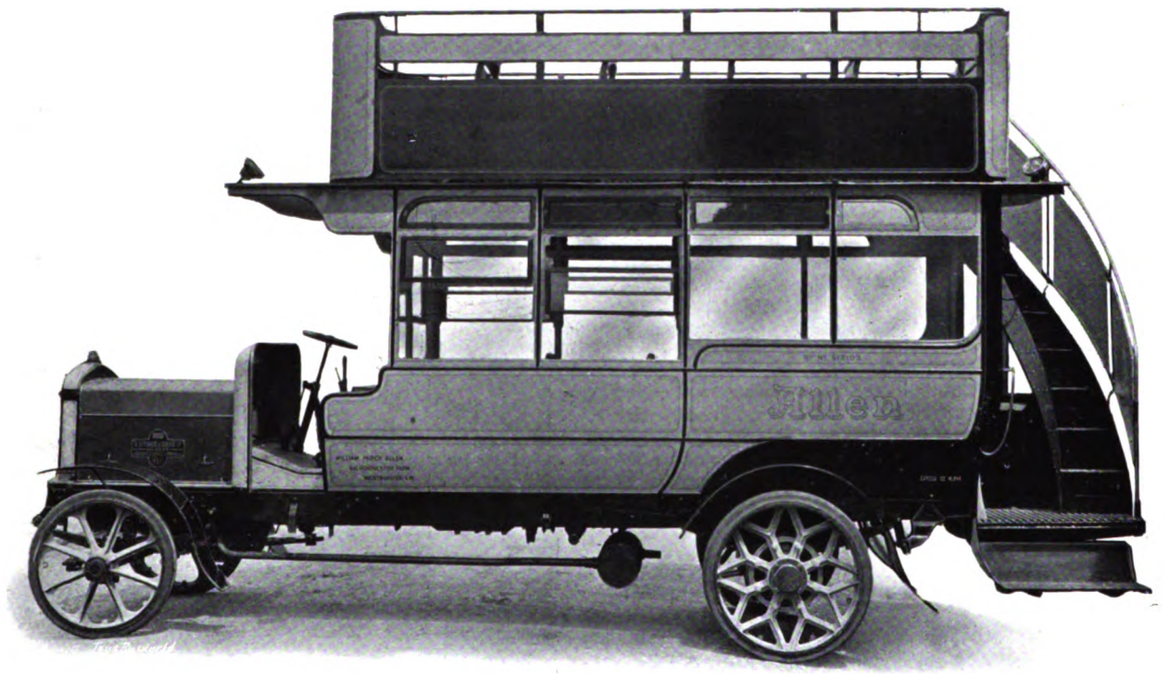
## NEW STRAKER-SQUIRE LONDON OMNIBUSES.

A new type of omnibus is now being put into service in London by Mr. William Percy Allen, and will be known as the "Allen." The present arrangements include the running of 20 of these vehicles on the Victoria to Liverpool Street route. As will be seen by the illustration, the design is a notable advance upon anything now running, and as special attention has been paid to the comfort of the passengers, it is expected that the service will immediately become popular.

The chassis is the Straker-Squire new "C.O." type, with live axle, and the following is a brief specification: Overall length, 19 ft. 6½ in.; overall width, 7 ft. 1¾ in.; wheel base, 13 ft. 6 in.; wheel gauge, 5 ft. 9¼ in.; length from dash to rear of frame, 15 ft. 3⅞ in. The frame is constructed of pressed steel braced together with transverse members of pressed steel, the gusset plates being made solid with the cross members. The engine has four cylinders, cast in pairs 4¼ in. by 5 in., the inlet and exhaust valves being all located on the same side and operated by one cam shaft. The valves are all interchangeable. The crank shaft is of high-tensile steel, running in three white metal-lined bearings; the crank case is so arranged that the bottom portion can be dropped between the clutch and the gear box is provided with double universal joints. The gear box is of the silent chain-driven type, giving three speeds forward and one reverse, the third speed being the direct drive. The gears are operated by a single lever working in a gate, the shafts being mounted in ball bearings enclosed in cages. External double-grip and internal expanding brakes are fitted, the former being operated by a foot pedal and acting upon a drum mounted on the gear box shaft, while the hand brake acts upon the inside drums of the road wheels. This is of the compensation type, the wearing parts of which can easily be adjusted and renewed. The front axle is of the Ackerman type, the steering being effected by screw and nut gear of a design which has been specially constructed to meet the requirements of the London police authorities. The road wheels are of cast steel, the front being fitted with single tyres 900 by 100 mm., and the back with twin tyres 1,000 by 100 mm. The transmission from change speed gear box to back axle is by cardan shaft and worm-wheel gearing, the worm being of special case hardened steel, and the worm wheel of hard phosphor bronze. The live axle is a steel forging of special design, and is of great strength. The road wheels rotate upon the stationary axle forging at the end of the tubular arms, the drive being transmitted through two shafts direct to the wheels. The shafts carry no portion of the weight of the vehicle. The differential is of the bevel type, and



New Straker-Squire Omnibus for London Service.

without interfering with the crank shaft bearings. Inspection doors are also provided. The lubrication of the engine is on the automatic principle. A sump is cast in the lower portion of the base chamber, into which the oil is placed. An oil pump driven by spiral gearing from the cam shaft circulates the oil through troughs cast in the bottom half of the gear case. These are always kept at a constant level, and scoops fitted into the connecting rods provide a very efficient lubrication for the big ends, the splash giving the necessary lubrication for the gudgeon pins, pistons, etc. A test cock is provided in the crank case for the purpose of ascertaining the oil level from time to time. A Bosch high-tension magneto is fitted at the side of the engine opposite to the valve gear. This is secured in position by a bridle, and is both accessible and easily removable. The drive of the magneto and cam shaft is by helical wheels, a small lever fitted to the steering regulating the spark. The cooling is on the thermo-syphon principle, the radiator being of the gilled tube type. Vanes on the periphery of the fly wheel form a fan for the purpose of drawing air through the radiator.

The control of the engine speed is carried out by means of a foot pedal acting upon the engine throttle. A small lever is fitted to the dash board for setting the engine's revolution at a low speed, all acceleration being done by the foot pedal. The clutch is of the leather-faced type with self-contained thrust spring. The connection the driving wheels revolve on floating bronze bushes. All the back axle bearings are of the ball type with ample ball thrust. Specially constructed rear springs are fitted in order to take the driving strains and torque. These are hung in shackles at the rear end and fixed at the front end. A removable sheet-steel undershield is bolted underneath the frame, the clutch and change-speed gear being also enclosed in a dust-proof casing.

The body is an entirely new registered design, and was built by Christopher Dodson, Limited, of London. It is constructed to carry the usual number of passengers, the inside seating accommodation, however, being arranged partly on cross seats facing forward and partly on longitudinal seats. Special attention has been paid to the ventilation of the interior, sliding half-glasses being fitted to the fore-end of the body. Owing to the use of Dodson's patent crossbars the bodies of these vehicles are much lighter than the standard type now running in London. By this means it has been possible to considerably reduce the weight of the bottom framing and at the same time retain the stability and strength required for public service vehicles. As the Allen omnibus is upholstered in apple green velvet with superior fittings, electric light, etc., a very handsome effect has been obtained. The exterior is painted in primrose yellow, relieved with black, and it is safe to say that in appearance the new vehicles will be the most distinctive on the London streets.

# MOTOR TRAFFIC.

## COMMERCIAL MOTOR VEHICLE EXHIBITION.

THE COMING SHOW IN LONDON.

The exhibition of commercial motor vehicles, promoted by the Society of Motor Manufacturers and Traders, which is to be held at Olympia, London, from July 18 to 26, promises to be of great and varied interest. It is now no less than five years since a similar show was held in London, and during that interval great progress has been made. In all, there will be about 175 exhibitors.

In order to call public attention in good time to the show, the Society of Motor Manufacturers and Traders gave a dinner at the Grand Hotel, Charing Cross, London, on July 3. Mr. S. F. Edge, president of the Society, was in the chair, and among others present were: Lieut.-Colonel A. F. Mulliner, E. M. C. Inston (Daimler Company), vice-president, F. W. Shorland (Clement Talbot), S. Straker (Sidney Straker and Squire, Limited), chairman of Commercial Vehicle Committee, Raymond Dennis (Dennis Brothers, Limited), R. Barry Cole (Commercial Cars, Limited), F. Churchill (J. and E. Hall, Limited), W. Dewiss (Milnes-Daimler), J. Maughfling (Thornycroft and Company, Limited), A. Spurrier (Leyland Motors, Limited), Chas. Jarrott (Jarrott and Letts, Limited), A. S. Mays-Smith (Delaunay Belleville, Limited), P. Liversidge (Liversidge Brothers, Limited), H. Smith (Rover Company, Limited), J. D. Siddeley (Deasy Motor Car Company, Limited), D. Citroen (Minerva Motors, Limited), A. Brown (Brown Brothers), H. A. Blackie (Exhibition manager), C. D. Clayton (Press manager), and T. F. Woodfine (secretary of the S.M.M. and T.)

In proposing the toast of "The Exhibition," Mr. Sharpnell Smith referred to the great progress mechanical road traction had made during the past five years, and said he felt confident that the display at Olympia, coupled with the fact that the railway companies had raised their transport rates some 4 per cent., would result in a very large increase in the number of motor vehicle users in all parts of the country.

Responding to this toast, Mr. Straker said that everything possible had been done to make the forthcoming show a success, and they had every reason to hope that it would prove to be the finest exhibition of industrial motor vehicles that had ever been held. In response to the society's invitations, municipal authorities from all parts of the world had arranged to visit the exhibition.

The Chairman proposed the toast of "Our Guests," and reminded the company that the use of motor vehicles not only economically replaced horses, but meant increased trade. In London alone £35,000,000 was paid annually for haulage, and although a considerable portion of this was now earned by horses, in the comparatively near future there could be no question but that the bulk of it would pass to the motor vehicle.

SOME EXHIBITS.

With the exception of the annex the whole of the available space has been taken up at Olympia. Amongst the large number of exhibits will be found motor vehicles for every possible trade or industry. A few preliminary particulars which have already come to hand are as follow:

THE ALBION MOTOR CAR COMPANY, of Glasgow, will exhibit no less than six distinct models. First is a 15-H.P. box van with 9 ft. wheel base, to carry a load of 15 cwts. (exclusive of weight of body). The body has a sliding panel behind the driver, and high side doors fitted to the driver's seat. It is fitted with 880 mm. by 120 mm. plain Dunlop pneumatic tyres on the front wheels and solid tyres to the rear wheels. A 16-H.P. 25-cwt. special box van built to the order of Messrs. James Buchanan and Company, distillers, London, is also shown. It has a wind screen in front of the driver, and high side doors to the driver's seat, and solid tyres on all wheels. Next is a 25-H.P. 2-ton chassis. This is the Albion Company's latest model, which is being exhibited for the first time. It is designed to carry a load of two tons plus weight of body. A 32-H.P. 3-ton chassis is designed to carry a load of three tons plus weight of body. The wheel base is 13 ft. 1 in., and the machine is fitted with steel wheels. A 32-H.P 29-seated torpedo chars-a-banc, has a wheel base of 14 ft. 5 in. This luxurious chars-a-banc has six rows of seats, each seat to take five persons, except the driving seat, which holds four including the driver. The vehicle is fitted with Cape cart hood and folding wind screen. A 32-H.P. 4-ton lorry, has a plain platform 13 ft. long by 6 ft. wide. It is interesting to note that a duplicate of this vehicle obtained the gold medal at the St. Petersburg Motor Show in May.

THE BERNA COMMERCIAL MOTORS, LIMITED, will include in their exhibit a 5-ton lorry, of which we give an illustration. They inform us that the remarkable record of this type of machine has led to its free use both at home and abroad. It is very widely used, especially in the Manchester district. In keen competition with other well-known makers this firm recently secured a number of orders in that neighbourhood and so satisfactory has the service been that already they have received repeat orders for similar vehicles. As evidence of the reliability of these vehicles the Berna Company have received a report from the Dundee Motor Lorry Company in which they state that after fifteen months' continuous service, during which time it had never had

Berna 5-Ton Lorry.

any overhaul or shed day, the first of the 5-ton lorries purchased from them has been thoroughly overhauled. Every part was examined and cleaned, but the only part it was necesssry to renew was a band for the off-side rear band brake. The writer of the report states that he has had considerable experience with commercial vehicles, but had never before met a 5-ton lorry that would run during a period of fifteen months, do over eleven thousand miles, and then finish up with what his foreman calls a "childish overhaul."

COMMERCIAL CARS LIMITED, of Luton, will show some five models covering a wide range of useful work in the traction field. These

Commercial Cars Wagon—Method of Tipping.

will include chars-a-banc, vans, lorries, etc., but the exhibit which will be of special interest to the majority of readers will be the special tipping wagon, which we illustrate above. As will be seen,

Digitized by Google

# MOTOR TRAFFIC.

this particular vehicle was built for the Bedfordshire County Council. It is constructed to carry loads, including body, of six tons, and is fitted with a 40-H.P. 4-cylinder engine, 120 mm. bore by 140 mm. stroke, designed to run at 850 revolutions. The control, however, enables speed variations from 200 to 1,250 revolutions per minute. The cylinders are cast in pairs, and the engine is entirely enclosed in oil-tight and dust-proof casing. Automatic lubrication is maintained by means of an oil pump driven by skew gear off the cam shaft. The Commer Cars patent gear box gives three speeds forward and a reverse with direct drive on top speed, the gears being always in mesh. The final drive is by means of side roller chains, which can be enclosed in the company's patent oil-tight cases if necessary. The method of

**Commercial Cars Tipping Wagon.**

operating the tipping gear, as will be seen from the illustration, is extremely simple. In front of the change-speed gear box, bolted direct to it through an adapting flange, is an aluminium gear case, oil-tight and dust-proof; in this is a worm and worm wheel. The worm is keyed to a special shaft forming an extension of the front portion of the main shaft of the change-speed gear box proper. The worm is provided with suitable ball thrust, and the whole of this part of the gear runs in oil. A connection is made with the lifting screw, which is operated as shown in the illustration. The worm wheel is thrown in and out of gear by a lever which fits on the end of a spindle supported by a bracket direct to the side members of the frame. The Bedfordshire County Council have now three of these machines at work, each of which is giving complete satisfaction.

DENNIS BROTHERS.—One of the exhibits on the stand of Dennis Brothers. Ltd., of Guildford, will be a 66-H.P. four-cylinder fire engine similar to that recently supplied to the Leeds City Corporation, an illustration of which is here given. The Gynn pump has a capacity of 400 gallons per minute, and the machine carries a 55 ft.

**Dennis Fire Engine.**

escape. A feature of special interest in this model is the fact that instead of the customary chemical first-aid equipment, an auxiliary gear-driven pump is fitted, which works at about 100 lb. pressure through the first-aid hose. We understand that Messrs. Dennis will include two entirely new models in their exhibit.

THE CONTINENTAL TYRE AND RUBBER COMPANY (GREAT BRITAIN) have succeeded in obtaining an excellent position in stand No. 174. The feature of their exhibit is of course the famous "Continental" "T" pattern solid tyre. This is the original "T" section tyre, as opposed to the round pattern. The chief advantage lies in the fact that the wearing surface remains practically the same width from the beginning to the end of the tyre's life. The extraordinary resiliency gives an extra mileage, and it is principally on this extra mileage that the Continental Company base their claims for their "T" pattern tyres. Sections as well as complete tyres will be shown as evidence of the good wearing qualities of these tyres. We are informed that a record was kept of nearly 700 tyres used consecutively on Messrs. Tillings' motor omnibuses, and the average was over 20,000 miles per tyre.

THE MIDLAND RUBBER COMPANY will show specimens of all classes of Midland solid and pneumatic tyres for commercial motor vehicles in varying sizes and patterns, solid band tyres of three distinct sectional designs being standardised; viz., square tread, round tread, and concave or "T" pattern. Among the company's exhibits are solid band tyres suitable for heavy steam traction work up to 170 mm. in section; grip or clincher pattern solid tyres suitable for light commercial motor work; grooved, ribbed, and steel-studded "Midland" and "Britannic" pneumatic tyres made specially for commercial work; specimens of wheels, steel felloes, and flanges suitable for various classes of work; photographs of numerous vehicles fitted with "Midland" tyres, and specimens of "Midland" solid tyres removed from service after running over 36,000 miles.

THE MOTOR RADIATOR MANUFACTURING COMPANY'S exhibit will include radiators of Zimmermann honeycomb type for "Fowler" tractor, radiator of Zimmermann honeycomb type for "Ransomes" petrol lawn mower, radiator of gilled tube type for Wolseley "Subsidy" lorry, radiator in Zimmermann honeycomb type for "Hillman" van, and radiator in plain flattened tube type for Tilling motor 'bus.

MESSRS. JOHN I. THORNYCROFT AND COMPANY are showing a number of their models. These will include a 4-cylinder 30-H.P. type "K" chassis; 3-ton lorry, War Office subsidy type; a brewer's dray mounted on the same chassis; a 4-cylinder 30-H.P. type "J" chassis fitted with a 28-seated chars-a-banc; a 4-cylinder 30-H.P. type "M" chassis fitted with a colonial 2½ ton lorry; a 4-cylinder 30-H.P. narrow type "D" with a 2-ton sheet body; and a new 4-cylinder 16-H.P. 35-cwt. box van. They will also have machines on the stands of Messrs. E. and H. Hora and Bayleys, Limited.

## MOTOR TRANSPORT CONFERENCE.

ARRANGEMENTS FOR AN IMPERIAL EVENT.

A large number of overseas delegates will attend the Imperial Motor Transport Conference which is to be held in London from July 18 to 25. The conference opens on the first-mentioned date, when the delegates will be entertained at luncheon at Olympia, Kensington, by the President and Council of the Society of Motor Manufacturers and Traders, on the occasion of the opening of the Exhibition of Industrial Motor Vehicles organised by that Society.

The meetings and the subjects to be discussed will be as follow:

Monday, July 21.—The fuel question and the possibilities of creating an adequate fuel supply for internal combustion engines within the Empire. Particular stress will be laid on questions relating to the production and use of alcohol as a fuel. Papers will be submitted by Sir Boverton Redwood, Bart., advisor on petroleum to the Admiralty, the Home Office, and the India Office; Professor Vivian Lewes, of the Royal Naval College, Greenwich; Mr. A. J. Butterfield, Assoc.Inst. C.E., and Dr. W. R. Ormandy.

Wednesday, July 23.—Motor vehicles for military use, and the production of vehicles suitable for military purposes, and also for ordinary industrial use throughout the Empire. Official statements will be made on behalf of the Army Council by Col. H. C. L. Holden, and Captain A. E. Davidson, secretary of the Mechanical Transport Technical Committee. Further papers will be submitted by Col. R. E. Crompton, Captain R. K. Bagnall-Wild, formerly secretary of the Mechanical Transport Committee, and Mr. Horace Wyatt, editor of *Motor Traction*, organising hon. secretary for the conference.

Friday, July 25.—The carriage of goods and passengers by motor vehicle. Papers will be submitted by Mr. W. Worby Beaumont, consulting engineer to the Chief Commissioner of Police; Mr. E. A. Greathed, general manager of the National Motor Cab Company; Col. R. E. Crompton, consulting engineer to the Road Board; Mr. G. Hamilton Grapes, representing the Postmaster-General of New Zealand; Mr. W. Tetley Stephenson, lecturer on transport at the London School of Economics; Mr. P. Ellison, general manager of the Eastbourne Corporation Motor Omnibus Department; and Mr. F. R. de Bertodano, managing director of the F.I.A.T. Motor Cab Company.

The president of the conference is Prince Arthur of Connaught, and the chairman of the Executive Committee is the Hon. Arthur Stanley, M.P., chairman of the Royal Automobile Club.

# MOTOR TRAFFIC.

## MOTOR VEHICLES AT THE ROYAL SHOW.

Although some excellent examples of the various types of road motor vehicles suitable for all descriptions of haulage were to be found as usual in the machinery section of the Royal Agricultural Show at Bristol, it was obvious that the forthcoming exhibition at Olympia overshadowed the "Royal" to a considerable extent. Individual exhibits were well up to the usual standard maintained at these shows by the leading manufacturers of industrial motor vehicles, but in point of number there was a falling off, and one missed several of the firms hitherto to be found at the Royal Agricultural Society's annual exhibition. A notable feature was the largely increased use of motor vehicles for the conveyance of material for the show buildings, the exhibits themselves, and the stores and provisions required for the accommodation of the vast number of visitors to the show ground. In this connection the machines of the Bristol Tramways and Carriage Company rendered excellent service, while a number of railway motor lorries and various makes of motor vans formed a constant link between the railway depots and the show ground right up to the opening of the exhibition.

The Bristol Tramways and Carriage Company, Limited, maintained an excellent service of motor omnibuses and chars-a-bancs to and from the joint railway station and the Show, in addition to a large fleet of their well-known blue taxi-cabs. Together with an efficient tramway service up to Durdham Downs, where the Show was held, these formed a most complete system of communication which was much appreciated by the outside visitors. The company were also exhibitors, and on a well-arranged stand displayed two machines, both of the new 3-ton worm-driven type with 28-H.P. four-cylinder engines. The cylinders are cast in pairs and the valves are all on one side, the springs and tappets being enclosed. The gear box gives four speeds forward and a reverse, and is operated by central control levers. The company's own pattern carburettor is fitted, an interesting feature of which is the fact that it will take a fuel mixture having 50 per cent. of paraffin. The bodies fitted to the exhibition models were of the lorry type, one being suitable for use as a brewer's dray and the other a flat platform with rail for a cover.

Leyland Motors, Limited, had an exceptionally fine exhibit, consisting of four models of their well-known standard practice. Of these a 400-gallon fire engine, fitted with a Rees-Roturbo pump and built to the order of the Chorley Fire Brigade, attracted considerable attention. This machine, it is understood, in no way differed from the Leyland standard, which has already been described in these pages. The standard 6-ton steam wagon shown is part of an order for 13 of these vehicles now in hand. They are fitted with a steam superheater and exhaust water heater, and as a result of this arrangement the consumption of fuel and water is no more than that of the ordinary 5-ton wagon, each on full load and under similar conditions. The steam pressure on these machines is 230 lb. per square inch, and the superheater takes the form of a single coiled steel tube placed just under the fire box tube plate. The fuel used is the ordinary gas works coke, and under ordinary conditions the consumption is 1 cwt. per 6 to 7½ miles. A 4-ton 40-H.P. covered van was another exhibit. This was a repeat order from Robertson and Sons, of Manchester, while the fourth vehicle was a 30-cwt. petrol chassis constructed to War Office regulations to qualify for the subsidy. In this model the double reduction gear for rear axle drive is enclosed in a casing bolted to the rear axle. The cardan shaft is enclosed in a tube, the forward end of which is provided with a large spherical bearing carried by the cross member. The 24-H.P. engine has four cylinders 4 in. by 5 in., with Bosch magneto ignition. Including 65 already delivered, Messrs. Leyland have received orders for 120 of this type of machine since it was placed on the market a few months ago.

Sidney Straker and Squire, Limited, of Nelson Square, London, showed two machines, namely, the C.O. model, which is described on another page, and a new 30-cwt. (C.W.) model, the latter being one of the novelties of the show. This machine is fitted with a 21-H.P. engine having four cylinders, 90 mm. bore. and 120 mm. stroke, with interchangeable valves all on one side. The whole of the cylinders are in one casting, with large water jackets: Bosch high-tension magneto ignition driven by gearing from the cam shaft is fitted. The cooling is on the thermo-syphon system, while a geared oil pump maintains efficient lubrication to all parts of the engine. The gear box is arranged to give three speeds forward and a reverse, operated by a lever on the gate change principle. From the gear box the transmission is by cardan shaft to the worm drive on the rear axle. The entire worm drive and differential are mounted on a steel casting placed on the top side of the axle, which is made up of a forging of high-tensile steel. It is anticipated that this model will be in considerable demand for light omnibus and van work where a good speed with a moderate load is desired.

Aveling and Porter, Limited, of Rochester, had a prominent stand. Included in their exhibit were a 5-ton steam tractor, a rubber-tyred 3-ton steam wagon, and the latest production of the works—a 4-ton petrol lorry.

Barford and Perkins, Limited, of Peterborough, exhibited their motor rollers in various sizes, including a new model weighing 10 tons empty or 11 tons with water ballast.

Fodens, Limited, of Sandbach, staged two models of their well-known steam vehicles, viz., a 5-ton steam wagon with steel tyres, and a 3-ton machine with rubber tyres built to the order of Messrs. Boots, chemists, of Nottingham. The latter machine has several special features incorporated, the most important being a feed water heater, special lubrication arrangements, and the attachment of wood segments to the large gear wheels with a view to reduce noise.

Richard Garrett and Sons, Limited, of Leiston, were responsible for a most interesting exhibit. Amongst their machines was a Garrett 5-ton patent compound superheated steam tractor, built to the order of Messrs. Rose and Sons, haulage contractors, of King's Lynn. As already explained in a previous issue of this journal, the special features of the Garrett machine is the inclusion of the company's patent superheater and balanced piston gear, which are responsible for the remarkably low fuel and water consumption, coupled with a large increase of power.

J. and E. Hall, of Dartford, exhibited three distinct models. These were a 24-seat chars-a-banc and two goods carrying machines. The most interesting of the latter being a 32-H.P. tipping wagon built to the order of the Sheffield Corporation.

Dennis Brothers, Limited, of Guildford, were represented on the stand of William Vincent, of Reading. Two models were shown, and the one in the form of a motor horse box proved to be a very great attraction. This vehicle is the outcome of a long and careful study of the requirements of horse transit, and the important points in construction are covered by patents. From the interest displayed by the visitors it was evident that the enterprise shown by Mr. Vincent was appreciated.

## BRITISH AUTOMOBILE TRACTION.

SECOND NEW DEPARTURE BY BRITISH ELECTRIC TRACTION COMPANY.

It was announced by Mr. E. Garcke, chairman of the British Electric Traction Company, who presided at the annual meeting on June 16, that the directors had formed the British Automobile Traction Company for the purpose of organising motor omnibus services wherever suitable openings presented themselves. This step is in addition to the running of motor omnibuses in London, which was inaugurated towards the end of last year in connection with the company's Metropolitan Electric Tramway undertaking, in order to meet the competition of the motor omnibuses on their tramway routes. Since then they had made agreements with the London General Omnibus Company and also with the Underground Electric Railways, and a new company had been formed, called the London and Suburban Traction Company, which had acquired the control of the share capital of the Metropolitan Electric Tramways, the London United Tramways, the Tramways (M.E.T.) Omnibus Company, and the South Metropolitan Electric Tramways and Lighting Company. The capital of the London and Suburban Traction Company was about £3,500,000, of which they held about £850,000. They had every reason to expect that the return on their investment in the London and Suburban Traction Company would be larger than it was on the separate undertakings before the amalgamation. He still considered that, given sensible legislation, electric traction on rails was capable of holding its own; and the feature which he hoped shareholders would recognise and appreciate in the directors' new policy with regard to motor omnibuses was that the management of the company was moving with the times, and was alert to take advantage of any opportunity which might present itself to compensate for past misfortunes and to improve their prospects.

Replying to the discussion, Mr. Garcke, referring to a shareholder's remark as to the satisfactory results attending small motor omnibus services over short routes on the Continent, said the point was one which was very prominently before the directors. As regarded motor omnibus services generally, however, they would adopt a cautious rather than a plunging policy.

THE REQUIREMENTS OF BLAYDON.—An appeal is to be made by Blaydon Urban Council to the Newcastle Corporation to establish a railless trolley car or motor omnibus service.

# MOTOR TRAFFIC.

## THE INTERNATIONAL ROAD CONGRESS.

The third International Road Congress was held in London from June 23 to 27, and proved very successful. It is claimed that the great work of road reform was really begun at the first Congress which was held in Paris in 1908, and was continued at the Brussels Congress in 1910. At the meeting in London something approaching 3,000 experts, gathered from 42 countries and colonies of the world, and many of them official delegates of governments, spent two days in discussing a wide variety of subjects relating to road construction and maintenance. These discussions were carried on simultaneously in four sections. Parts of two other days were taken up with an opening and a closing general meeting, at which the final resolutions were passed, and a number of additional days were occupied by visits and inspections. These, unlike many excursions connected with congresses on other matters, were of great practical utility, because the delegates had the opportunity to examine methods of road construction and maintenance wherever they went. This is the first time that the Congress has been held in Great Britain, and it was fitting that this country, which has taken a leading part both in road construction and in the use of motor vehicles, should receive an early visit. It was the coming of the motor vehicle which brought the Congress first into existence, and the problems associated with roads are likely to call for more and more engineering and practical skill and knowledge as automobilism, particularly of the heavy vehicle order, develops. The Congress, which is organised by the Permanent International Association of Road Congresses and by an organising committee of the country in which each meeting is held, promises to be an appropriate complement to such institutions as the International Railway Congress and the International Tramways and Light Railways Congress, the latter organised biennially by the Permanent International Tramways and Light Railways Union. The next Road Congress is to be held in Munich in 1916.

The Congress was held in London on the invitation of the British Government, the King gave his patronage, and the honorary presidents were the Chancellor of the Exchequer, the Secretary for War, the Secretary for the Colonies, the President of the Local Government Board, and the First Commissioner of H.M. Office of Works. The honorary vice-presidents included a large number of noblemen and gentlemen associated with automobilism, local authorities, engineering bodies, and traders. While the Permanent International Association of Road Congresses, whose head-quarters are in Paris, whose president is Mons. Albert de Préaudeau, inspector-general of bridges and roads, Paris, and whose secretary is Mons. Albert Mahieu, engineer-in-chief of bridges and roads, Paris, was the parent body for the Congress, the arrangements were carried out by a British Organising Council. Of this body Sir George Gibb, chairman of the Road Board, was chairman, while Mr. W. Rees Jeffreys, secretary of the Road Board, was honorary general secretary. The Council was formed of representatives nominated by associations of borough and rural local authorities, automobilists, commercial motor users, quarry owners, surveyors, engineers, municipal tramways, and other bodies. The detail work was carried out by several committees.

The opening general meeting was held on Monday, June 23, in the Wesleyan Central Hall, Westminster; the meetings of sections took place on the Tuesday and Wednesday in Caxton Hall, the Surveyors' Institution, and the Institution of Mechanical Engineers. The Thursday was devoted to excursions, including a visit to Windsor Castle on the invitation of the King, and the closing general meeting was held on the Friday in Caxton Hall. Receptions were given on various evenings by the Lord Mayor and Corporation of the City of London, by the Institution of Civil Engineers, and by the Royal Automobile Club. During the week an interesting exhibition (opened by Earl Beauchamp, First Commissioner of Works) was held at the Royal Horticultural Hall. This included all sorts of materials and appliances for road construction and maintenance, and of course methods of tar and bitumen treatment were much in evidence. There were about 80 exhibitors.

### THE OPENING MEETING.

It is impossible in the space at our disposal to go into any detail as regards the numerous meetings, but some indication may be given of the opening proceedings. The Right Hon. D. Lloyd George, Chancellor of the Exchequer, on behalf of the British Government, welcomed the delegates at the opening meeting, and dwelt on the importance of the problems with which the Congress had to deal. In doing so he drew a vivid contrast between the roads of England in the eighteenth century and the roads of to-day. The 231,000 miles of roads in this country at the present time he claimed to be about the best in the world. Next came a brief review of the enormous increase in the use of the roads since motor vehicles began, and the right hon. gentleman put the number of motor vehicles in this country at present at 220,000. From this arose the enormous importance of the science and art of road making and maintenance. In 1892 the roads of England and Wales cost for maintenance £8,500,000, while last year the cost was £15,500,000. Towards meeting the cost of improvements, the Road Board has since its formation in 1910 made grants to the extent of over £3,000,000. Sir George Gibb, who spoke next, pointed out that it was to Mr. Lloyd George that this country owed the first measure passed by Parliament for improving the roads and relieving the ratepayers of some of the costs. The financial question was a point which he emphasised, but he confessed that he did not see any considerable movement of British opinion towards the direct administration of any of the roads by a central Department of State. He thought county administration would be extended so as to cover a greater mileage, but that highway administration in Great Britain would remain a function of local government. As to methods, he said that the general trend of opinion in this country was undoubtedly in favour of the use of tarry or bituminous substances. He also commended to the foreign delegates the way in which modern road problems have been dealt with in Great Britain. A number of foreign delegates afterwards spoke.

### MEETINGS OF SECTIONS.

There were two sections of the Congress, each divided into two subsections. The leading points contained in a great number of papers prepared by road engineers and others in the various countries were, after the Continental method, summarised by general reporters (*rapporteurs*) previously appointed for the purpose, and the abstracts, together with conclusions or recommendations based on them, were the matters directly submitted to the sections for discussion. Tramways did not, except incidentally here and there, come before the meetings, but the road as affected especially by motor omnibuses and other heavy vehicles was continually under review. The meeting being of an international character, the resolutions had, of course, to be highly generalised so as to be applicable as far as possible to all the countries concerned. Perhaps one of the most remarkable things about the Congress was the smallness of the attendance and the brevity of discussions at the section which dealt with the finance of the construction and upkeep of roads and the provision of revenues. The question of who is to pay for the greatly increased and still increasing cost of road maintenance is a burning one, in this country at least, but perhaps because there is such a wide variety of practice in the matter abroad and because there is such a large proportion of national roads in foreign countries, the delegates did not appear to be greatly interested.

The abstracts of the enormous number of papers which had been contributed are in themselves very voluminous, and we must here content ourselves with an indication of the subjects of the resolutions which were prepared by the general reporters. These resolutions sought to crystallise the general opinions from a large number of countries, and they were put before the sections for discussion and adoption. The discussions were sometimes of considerable length, and numerous amendments were moved and some of them adopted. A criticism which was levelled at a good many of the amendments moved by British delegates was that they applied to conditions in this country and thus were not suitable for an international congress. This criticism was usually effective.

The following is an indication in brief of the principal resolutions passed:

*Planning of New Streets and Roads.*—It is better that new main roads be constructed to pass outside rather than through towns. Tramway tracks are best placed in the centre of roads. Main traffic roads should be designed so that spaces are provided for tramway tracks, fast and slow traffic, and standing vehicles. The planning of main road communication outside towns should be at once undertaken.

*Macadamised Roads Bound with Tarry, Bituminous, or Asphaltic Materials.*—By the use of such binders may be obtained a number of different forms of road crust which may be employed with advantage according to the conditions of traffic, locality, and climate. The exact value and duration of life of these various crusts remain to be determined. For this purpose it is desirable to draw up a uniform system of tests. Detail points were dealt with in supplementary resolutions.

*Wood Paving.*—Where gradients permit, wood-block pavement is very suitable for streets where the traffic is great but not of exceptionally heavy character. It is desirable that further investigations and laboratory experiments should be carried out in connection with the selection of timber and of the impregnating preservative. It does not appear desirable to recommend hard woods for roads with intense traffic. Soft woods are equally suitable for roads of heavy and of light traffic.

Digitized by Google

# MOTOR TRAFFIC.

*Methods of Lighting.*—Every vehicle should carry a light which can be seen from the rear as well as from the front. Every motor car should carry two lamps in front and one at the back; if of high speed it must have a head light which can light the road for 50 yards. Regulations should be made to compel drivers of cattle to make their presence known.

*Observations since 1908 on Causes of Wear of Roads.*—Weather conditions are among the most powerful influences which cause deterioration of roads. The destructive effect of weather can be minimised by effective waterproofing on the road surface. Any considerable volume of motor traffic has a seriously damaging effect on water-bound macadam roads. The damaging effect of heavy motor vehicles can be minimised by the use of wheels of large diameter, tyres of suitable width, rubber tyres, and suitable springs. The International Permanent Commission is charged with the preparation of a programme of observations, studies, and experiments.

*Regulations for Fast and Slow Traffic.*—These should be as few and simple as possible, and should be universally enforced. In all large cities there should be a traffic authority. Drivers should be carefully trained.

*Authorities in Charge of Roads.*—It is impossible to lay down any general rule of universal application as to the extent to which the road organisation of any country should be centralised or decentralised. The unit of administration should be sufficiently large and command sufficient resources to employ and adequately remunerate a competent staff.

*Finance of Construction and Upkeep.*—The expenditure on the maintenance of main roads should be mainly paid out of national revenues subject, where local administration prevails, to the supervision of a central government authority. It is equitable that vehicles which cause special damage to roads should be subject to special taxation, the proceeds of which should be earmarked for expenditure on roads.

### THE CLOSING MEETING.

At the final general meeting in Caxton Hall on June 27, after the resolutions had been confirmed, Sir George Gibb, who presided, gave a short farewell address to the delegates. The representatives of a number of foreign countries delivered speeches expressing appreciation of all that they had seen, and of the hospitality they had received. Votes of thanks closed the proceedings.

## I.A.E. VISIT TO AMERICA.

During several weeks in June a considerable party of members of the Institution of Automobile Engineers paid a visit to the United States, when the Society of Automobile Engineers of that country gave them a most hospitable reception in return for the welcome accorded to the Society on the occasion of their visit to Great Britain two years ago. An interesting sight at the huge building in New York of the Automobile Club of America was the garage, containing 600 cars, and the testing laboratory. The latter was installed in 1910 for the purpose of testing motors or any individual parts thereof; these tests may be either a private test solely for the benefit of the inventor or a public test on the lines of those held by the Royal A.C. The plant consists of an electric cradle dynamometer and all the necessary recording instruments, one of the most interesting of which is an instrument used for recording the amount of fuel consumed at any part of the test as well as that used for the whole duration of the test. Visits were also paid to the Carnegie Steel Works at Pittsburg and to Indianapolis, where a 500 miles race was witnessed, and several works were visited, including the Prest-O-Lite factory where are manufactured the tins of pressed acetylene gas referred to by Mr. Coffin in his paper before the Institution in 1911; these tins can be obtained all over the country, the empty tins being left in exchange. The visit to Detroit proved to be the most interesting. First the Ford factory, with an output of 200,000 cars this year, was a revelation to the visitors, the machine tools and the system being remarkable. Other works inspected included those of the Hudson Motor Car Company, the Continental Motor Manufacturing Company, and the Chalmers Motor Company, where works organisation is a thing of which the owners are justly proud. The party embarked with about 600 members of the Society of the Automobile Engineers on a big lake steamer for the summer meeting of the S.A.E. Among the papers read were one by Mr. T. B. Browne, president of the English I.A.E., on "London Motor Omnibuses," Mr. E. B. Wood on "Engine Testing;" Mr. Thos. Clarkson on "Steam Omnibuses;" and by Mr. Chas. Wheeler on "Depreciation." Cleveland, Buffalo, and New England also entertained the visitors.

## BIRMINGHAM AND MIDLAND OMNIBUS.

Presiding at the 29th ordinary general meeting of the Birmingham District Power and Traction Company, held at the Electrical Federation Offices, Kingsway, London, Mr. C. S. B. Hilton stated that the year's operations showed a surplus of £55,449, as compared with £52,841 the previous year. Referring to the company's investment in the Birmingham and Midland Motor Omnibus Company, he stated that the horse omnibuses have now almost disappeared. Messrs. Tilling-Stevens had delivered 13 30-H.P. omnibuses, 24 40-H.P. omnibuses, all double-deck, and in addition two single-deck omnibuses, and the only other vehicles to come were 10 single-deckers. By means of motor omnibuses they were operating six routes entirely inside Birmingham, one partly inside Birmingham and running out into the Black Country, one entirely in the Black Country, and in addition a separate service in Sutton Coldfield, which started at the end of the Birmingham Corporation Tramways, and ran through Sutton Coldfield towards Lichfield. The mileage run by motor omnibuses was now about 21,000 a week, and the receipts per 'bus-mile and the behaviour of the petrol-electric vehicles was satisfactory and encouraging. The Corporation of Birmingham had decided to institute a service of motor omnibuses from the terminus of their Bristol Road tramway at Selly Oak out through Northfield to Longbridge, with the intention of continuing the service to the foot of the Lickey Hills, where the Birmingham boundary now is. The Corporation did not possess any general powers

**Tilling-Stevens Omnibus for Birmingham.**

to run motor omnibuses in extension of existing tramways, and along routes on which tramways were contemplated. It was not the company's policy to clash in any way with the development of the Birmingham Corporation Tramways, but rather to co-operate with this work, and he felt sure that this policy on their part was quite recognised by the Corporation, and that they would not in any way hamper the extension of their business on these lines. They hoped, with the co-operation of the Corporation, to start shortly a service of single-deck omnibuses from Hales Owen through Quinton into New Street, Birmingham, which would place that isolated industrial town within easy reach of Birmingham. The report was adopted, together with the recommendations contained as to dividends.

The single-deck omnibus referred to by Mr. Hilton is shown in the accompanying illustration.

MOTOR OMNIBUS POWERS FOR LEICESTER.—The Leicester Corporation bill, under which powers were sought to run motor omnibuses on three routes partly within and partly without the borough, was passed by a Committee of the House of Lords in June. It was agreed that for three years the Corporation should pay to the County Council three-eighths of a penny per car-mile, and that at the end of the period the question should be submitted to an arbitrator, who should decide what extra cost, if any, had been involved in road maintenance by the running of the vehicles, and that the Corporation should contribute one-third of the extra cost.

# MOTOR TRAFFIC.

## PETROL-ELECTRIC OMNIBUS COSTS.

RESULTS OF THE "TILLING-STEVENS" VEHICLES FOR 1912.

Messrs. Tilling, Limited, who run the Tilling-Stevens petrol-electric omnibuses in London, have issued the following statistics for the year 1912:

| | d. |
|---|---|
| Cleaning, adjustment, and maintenance | 1·163 |
| Tyres | 1·105 |
| Drivers | 1·257 |
| Petrol, lubricating oil, grease, and paraffin | 1·197 |
| Vehicle lighting | ·075 |
| Rent, rates, taxes, garage lighting, water for trade vehicles, depreciation (6 years) | ·986 |
| Conductors | ·847 |
| Body upkeep | ·235 |
| Traffic expenses | ·267 |
| Pence per mile | 7·132 |

MILES COVERED FROM JUNE 15, 1911, TO JUNE 4, 1913.

| | |
|---|---|
| 1911 | 119,017 miles. |
| 1912 | 1,387,031 " |
| 1913 | 1,685,650 " |
| Total | 3,191,698 " |

MILES COVERED BY THE FIRST SIX "TILLING-STEVENS" PETROL-ELECTRIC OMNIBUSES FROM COMMENCEMENT OF SERVICE TO MAY 28, 1913.

| | |
|---|---|
| 1st 'bus | 81,204 miles. |
| 2nd " | 75,535 " |
| 3rd " | 75,245 " |
| 4th " | 70,839 " |
| 5th " | 64,972 " |
| 6th " | 61,601 " |
| Total | 429,396 " |

## WOLVERHAMPTON MOTOR SERVICE.

The following is a summary of the accounts for the year ended March 31, 1913, of the motor chars-a-bancs service of the Wolverhampton tramways:

| | Average per Mile run. | Year ended March 31, 1913. |
|---|---|---|
| INCOME. | d. | £ s. d. |
| Traffic receipts | 9·878 | 1,710 11 7 |
| EXPENDITURE. | | |
| *Operating Costs:* | | |
| Petrol | 1·399 | 242 3 9 |
| Wages of drivers and conductors | 2·013 | 348 9 9 |
| " of oilers and cleaners | ·241 | 41 15 6 |
| Oil, grease, and sundries | ·168 | 29 2 10 |
| Tickets, waybills, etc. | ·022 | 3 16 11 |
| Uniforms | ·063 | 10 19 3 |
| Miscellaneous | ·004 | 0 14 9 |
| | 3·910 | 677 2 9 |
| *General Charges:* | | |
| Licences | ·063 | 10 17 6 |
| Insurances | ·217 | 37 13 0 |
| | ·280 | 48 10 6 |
| *Maintenance, Repairs, etc.:* | | |
| Chassis | ·662 | 114 12 4 |
| Bodies | ·219 | 37 19 2 |
| Tyres | 1·343 | 232 10 10 |
| Depreciation of chars-a-bancs | 1·441 | 249 10 4 |
| | 3·665 | 634 12 8 |
| Bank interest | ·252 | 43 11 6 |
| | 8·107 | 1,403 17 5 |
| Balance carried to appropriation account | 1·771 | 306 14 2 |
| | 9·878 | £1,710 11 7 |

For the previous year the profit was £191, and the total working costs per mile run to 9·905d. The mileage run was 41,559 miles, as compared with 16,721.

"IMPOSSIBLE TO HIRE A MOTOR OMNIBUS FOR A SEASON."—The Tramways Committee of the Douglas Town Council have reported that they find it is impossible to hire a motor omnibus for the season, and that they are therefore compelled to abandon the proposal of a motor service.

CAB CHASSIS FITTED WITH PARCEL CARRIER BODIES.—Many of the "W. & G." express carrier vans recently placed upon the London streets have chassis which were formerly in use with cab bodies. Messrs. W. & G. du Cros, of Acton Vale, are adopting this means of turning some of their vehicles to more profitable use than has been possible in the motor cab trade with two strikes in a year. The innovation, moreover, is filling a decided want in the metropolis.

## ROAD BOARD'S REPORT FOR 1912-13.

In the House of Commons on June 23, Mr. Bridgeman asked the Secretary to the Treasury if he could state what was the cause of the delay in the publication of the report for 1912-13 of the Road Board, and if it was intended to publish it in time for discussion during this session.

Mr. Masterman replied that he did not think there had been any unusual delay. The report could not be published until the financial year was ended, and it contained accounts for that year which have to be made up and audited. It was now under consideration, and it would be presented as soon as possible.

Mr Bridgeman also asked if the Secretary to the Treasury would state what were the sums actually received by the Road Board since its formation; what amount had actually been paid out in salaries, grants, and loans respectively: what sums had been definitely promised; and what balance remained in hand, at the bank, and invested.

Mr. Masterman circulated the following reply: The receipts actually paid into the Road Improvement Fund from the constitution of the Road Board up to May 31, 1913, were as follow:

| | £ |
|---|---|
| Motor spirit duties | 2,011,719 |
| Carriage licences | 1,349,125 |
| Interest on investments | 95,739 |
| Interest on loans | 438 |
| | £3,457,021 |

The amount actually paid out in salaries during the same period was £19,407. Grants to an aggregate amount of £2,461,045 and loans to an aggregate amount of £800,067 have been definitely promised, and the amounts actually paid out have been £696,849 under grants and £128,239 under loans. The balance at the Bank of England on May 31, 1913, was £14,624, and the investments at cost amounted to £2,602,527.

OMNIBUSES REQUIRED FOR CHESTERFIELD.—In connection with the passing of the Corporation's bill relating to railless trolley traction and motor omnibuses, the Tramways Committee are to report upon the type and number of omnibuses to be obtained for testing trolley routes.

PETROL TRAMCAR FOR STIRLING.—The Stirling and Bridge of Allan Tramway Company having applied to the Board of Trade for a licence to use a petrol-propelled tramcar on their lines, the application has been granted, subject to the consents of the local authorities being given.

MOTOR VEHICLES REQUIRED IN AUSTRALIA.—During a tour made by the Minister for Lands (Mr. Bath) and the Minister for Works (Mr. Johnson) in the Yorkrakine country, Victoria, in May, the first named stated that the present railways under construction, under survey, and awaiting survey were as much as the Government could undertake for the next three years, but as a temporary expedient in some areas they were now trying to see if they could not introduce road tractors that would act as feeders until such time as they could extend the programme which they now had in hand. The Minister for Lands, referring to the purchase of road tractors, said they had had an offer from a firm, but as the scheme, if taken up, would be largely in the nature of a trial to see how it worked, the offer was such as did not meet with acceptance. The Government were now inquiring into the working of road tractors to see whether it would be a practicable proposition, but only then as a stopgap until they could extend their present railway programme.

AN INTERESTING CATALOGUE.—Sidney Straker and Squire, Limited, of Wilson Square, Blackfriars, London, have just issued a new descriptive catalogue of their industrial motor vehicles. The catalogue, which comprises some 48 pages, is well illustrated, and gives the reader a very good idea of the wide experience of the firm in all departments of the motor industry, including motor omnibuses of all types, chars-a-bancs, ambulance vans, tower wagons, motor lorries, motor vans, motor tramcars, and petrol locomotives. In their introductory remarks Messrs. Straker state that up to the present time they have supplied some 3,000 motor vehicles for various purposes, not less than 860 of these being for public service. A special feature of the catalogue is the inclusion of a number of interesting illustrations taken from photographs of Straker-Squire vehicles at work in various parts of the world. Specifications and particulars of each type are given, together with a considerable amount of information regarding the method of manufacture and conditions of sale.

# MOTOR TRAFFIC.

## MOTOR TRAFFIC NOTES.

ELECTRICAL MAIL VANS.—The Austrian postal service recently began running 30 electric accumulator motor mail vans. A garage for 50 of these vehicles is in course of erection.

PARAFFIN FOR FIRE BRIGADE MOTORS.—The London Fire Brigade have for the last 12 months been using pure paraffin as motor fuel, with very satisfactory results. The cost has been about 7d. per gallon.

CONTINENTAL TYRES.—At the St. Petersburg Motor Show 63 per cent. of the solid tyres fitted to exhibits were the "T" pattern Continental tyres, made by the Continental Tyre and Rubber Company, Thurloe Place, London, S.W.

OMNIBUS LIFE-GUARD EXPERIMENTS.—The London General Omnibus Company have set up a special staff for the purpose of conducting experiments in connection with life-guards. The company are willing to suitably compensate persons who submit suggestions which the company ultimately adopt.

FURTHER COMPETITION AT CROYDON.—Messrs. Tilling on June 10 instituted an extension of their motor omnibus service from East London to Croydon. For a portion of the distance the new service competes with the tramways, as well as serving districts which have asked for tramway extensions.

INCREASED RAILWAY CHARGE FOR CARS AND OMNIBUSES. The railway companies of the United Kingdom on July 1 instituted a new scale of charges for warehouse rent, wharfage, and labour applicable to merchandise traffic. Motor cars, omnibuses, and tramway cars, irrespective of weight, now pay 1s. 6d. each per ton, against 1s. hitherto paid.

A YEAR'S OMNIBUS WORKING AT NEWCASTLE.—The Tilling-Stevens omnibuses, running to Westerhope in connection with the Newcastle-on-Tyne Corporation Tramways, have been running a year. Councillor Rodgers, chairman of the Tramways Committee, has stated that the vehicles have traversed 48,000 miles. The service acted as a feeder to the tramways.

MUNICIPAL UTILITY MOTORS.—The Westminster City Council are to add four more motor wagons to their fleet of 20. Before coming to this decision the Council received a report stating that the surveyor had found on a tonnage basis that one motor wagon was the equivalent of 4·12 horses. The cost per ton by motor wagon was 2s. 9 28d. as compared with 3s. 10·12d. for horse vehicles.

COMMERCIAL VEHICLE EXHIBITION.—Our advertisement columns contain an announcement of the Commercial Vehicle Exhibition, which is to be held at Olympia from July 18 to 26 inclusive. Prince Arthur of Connaught will perform the opening ceremony. Some years have elapsed since a similar show was held in London under the auspices of the Society of Motor Manufacturers and Traders, and the importance of the present one is enhanced by the Imperial Motor Conference which is to take place concurrently.

ROTARY OR TURBINE INTERNAL COMBUSTION ENGINE.—Mr. W. Worby Beaumont's offer of a challenge cup or plate for the best practically useful rotary or turbine internal combustion engine, applied to a motor vehicle and entered for trial under Royal A.C. Regulations in 1915, has been accepted with thanks by the committee. The committee decided that under the term "rotary" would be excluded all engines with essential reciprocating parts, and that the award should be made or withheld at the discretion of the committee.

WITHDRAWAL OF REDUCED FARES ON NON-COMPETITIVE ROUTES.—By 16 votes to 11 Walthamstow Council have suspended the issue of return tickets at reduced fares on the St. James Street and Forest Road routes, where there is no motor omnibus competition with the tramways. On the first-mentioned route, in 28 days, there was an increase over the corresponding period of last year of 20,480 passengers, of whom 16,232 travelled by ordinary tickets. The gain in receipts was £34. The Forest Road route showed a gain of 9,006 passengers, and a loss of £32.

ROADS IMPROVEMENT ASSOCIATION.—The unsatisfactory road surfaces in suburban parts of London has been discussed, and the association has resolved to obtain data and initiate a campaign for their systematic improvement. On the question of altering the rule of the footpath to correspond with that of the road, in connection with a report received from the Road Users' Conference, the council have unanimously resolved, as hitherto, to recommend the alteration. This would necessitate pedestrians facing approaching traffic, and would force upon them the need to take care before stepping off the footpath.

BRITISH MOTOR CAB DIVIDEND.—The directors report for the 12 months ended March 31 that, after adequately providing for depreciation of rolling stock and other assets and putting aside a sufficient sum to cover all outstanding claims, there remains a balance of £24,069, of which they propose to utilise £19,925 in paying a dividend of 5 per cent. on the preferred ordinary shares. As the result of the settlement of the 10 weeks' strike of drivers the company have to bear the increased cost of petrol, but it is hoped that the profits which will be received from the receipts of the new cabs which are being built will, to some extent, compensate for this.

WIDTH OF LOADS ON MOTOR VEHICLES.—In his annual report Mr. Mozley, manager of the Burnley Corporation Tramways, says: "Considerable delay to the cars has been experienced owing to the inability of heavy locomotives to climb gradients. The matter has been referred to the town clerk with a view to removing the difficulty. A defect in the Motor Car Order of 1904 with respect to the width of loads which light locomotives are permitted to carry is receiving the attention of those concerned. The Order, whilst allowing a vehicle to be 7 ft. 6 in. wide, apparantly places no restriction on the width of the load, and in some cases it is found that loads measuring 10 ft. 6 in. are carried, which are a serious obstruction to the cars."

MOTOR OMNIBUSES FOR WARRINGTON CORPORATION.—By the courtesy of the makers, Messrs. W. A. Stevens and Company, Limited, a representative of THE TRAMWAY AND RAILWAY WORLD was enabled

to take the photograph reproduced above of the first Stevens-Tilling petrol-electric omnibus for Warrington Corporation. This omnibus has the well-known characteristics of the machines manufactured at Maidstone, and will no doubt give satisfactory results.

OMNIBUSES AND MANCHESTER'S LATE SERVICE PROBLEM.—Manchester Tramways Committee are extending the service of motor omnibuses from Palatine Road terminus and Northenden, and if the experiment is successful these vehicles will be used to connect the same terminus with Didsbury and Cheadle. The committee have four 'buses ready for use, and an extended trial on June 17 proved highly satisfactory. Alderman Bowes, chairman of the committee, interviewed in regard to the demand for an all-night tramway service, has stated that probably when it is seen how the motor 'buses work in the Northenden and Cheadle districts the committee will try the experiment of running such 'buses on selected routes for the benefit of people who are kept at work until past midnight.

INDIAN RAILWAYS AND ROAD MOTOR VEHICLES.—The railway authorities of Bengal, Bombay, and Madras are being urged to provide services of road motor vehicles in areas where the construction of railways is out of the question. Motor goods lorries are operated in Madras City. What Sir Henry McCullum, ex Governor of Ceylon, has accomplished in that island is quoted as an incentive. No fewer than 286 miles of new roads were constructed, and many existing roads were improved. The sum of Rs.18,000,000 was expended on the introduction of motor services as an adjunct to the railways. The Government of Ceylon have also introduced a motor mail service, and induced planters to invest in motor vehicles. The island, it is stated, has not yet solved the problem of the right kind of motor vehicle.

THE

# Tramway & Railway World

Vol. XXXIV. No. 3. | LONDON, SATURDAY, JULY 12, 1913. | [Established in 1892.

ANNUAL SUBSCRIPTION (Postage Prepaid)—in the United Kingdom, 25s.; for all places abroad, 28s.

Including sixty-four issues, of which twelve are large illustrated numbers, printed on fine art paper.

## NOTICES.

All Communications and Advertisements for next Saturday's issue should be received not later than 3 p.m. on Friday.

Advertisements for the next issue of which proof is desired should reach us by the second post on Wednesday.

The Editorial and Publishing Offices of "The Tramway and Railway World" are at Amberley House, Norfolk Street, London, W.C.

Telegrams: "TRAMIGRO, LONDON."
Telephone: No. 2948 GERRARD.

## WEEKLY LIST OF TENDERS INVITED.

### THE GREAT INDIAN PENINSULAR RAILWAY COMPANY.

The Directors are prepared to receive tenders for the supply and delivery of the following Stores, namely :—

Railway Tickets, etc.

Specifications and forms of tender may be obtained at this office on payment of the fee for the specification, which payment will not be returned.

Tenders must be delivered in sealed envelopes, addressed to the undersigned, marked "Tender for Railway Tickets, etc.," or as the case may be, not later than 11 o'clock a.m. on Thursday, July 17, 1913.

The Directors do not bind themselves to accept the lowest or any tender.

R. H. WALPOLE,
Secretary.

Company's Offices,
48, Copthall Avenue, E.C.,
July 9, 1913.

### PEMBROKE URBAN DISTRICT COUNCIL, CO. DUBLIN.

The Pembroke Urban District Council are prepared to receive tenders for Alterations and Extensions to Existing Switchboards at the Tramways Office, Municipal Buildings, Aberdeen.

Specification and form of tender may be obtained at the Town Hall, Balls Bridge, Co Dublin, any day during office hours on payment of two shillings and sixpence, which will not be refunded.

The contractor shall, if required, enter into a regular signed contract, and give security by bond for carrying out the work. The contractor must bear the expenses of contract and bond.

Tenders must be delivered at the Town Hall, Balls Bridge, Co. Dublin, not later than noon on Saturday, July 26, 1913, addressed to the Chairman of the Council.

The Council will not be bound to accept the lowest or any tender.

By order, J. C. MANLY,
Clerk to the Council.

Town Hall, Balls Bridge, Co. Dublin,
Dated July 9, 1913.

### BOROUGH OF TODMORDEN.

The Council of the above Borough invite tenders for :—

Section A.—Converting Plant for 300 kw.
" B.—H.T. Switchboards.
" C.—H.T. Cables.
" D.—Mechanical Stokers.
" E.—Superheaters.

Particulars may be obtained from Mr. Joseph Boyce, Borough Electrical Engineer, Electricity Works, Todmorden.

The tenders will be subject to the sanction of the Local Government Board being obtained for borrowing powers.

Tenders to be sent to the undersigned on or before July 26, 1913, marked "Electricity, Tender for Section —."

J. E. SUTCLIFFE,
Town Clerk.

Town Hall, Todmorden,
July 8, 1913.

### CITY OF ABERDEEN.

TRAMWAY DEPARTMENT.

UNIFORM CLOTHING FOR TRAMWAY EMPLOYEES.

The Corporation of Aberdeen are prepared to receive tenders for the supply of Uniform Clothing and Caps for Inspectors, Motormen, Conductors, and Parcel Boys.

Forms of tender may be had on application to the undersigned at the Tramways Office, Municipal Buildings, Aberdeen.

Tenders must be made on the forms provided, and must be handed in not later than 12 o'clock noon on Tuesday, July 22, 1913.

The Corporation do not bind themselves to accept the lowest or any tender.

The contractors will be required to pay not less than the standard rate of wages relating to the particular trades to which this specification applies.

R. STUART PILCHER,
General Manager.

Corporation Tramways Office,
Municipal Buildings, Aberdeen,
July 11, 1913.

### SHIPLEY URBAN DISTRICT COUNCIL.

The Shipley Urban District Council invite tenders for the supply, delivery, and erection of the following plant :—

(A) Two 1,000 kw. Steam Turbines.
(B) Two 1,000 kw. Alternators.
(C) Two Surface Condensers (for above plant).
(D) One Controlling Switchboard.

Copies of specifications, general conditions, etc., can be obtained from Mr. W. Redman, the Council's Electrical Engineer, Dockfield Works, Shipley, on the payment of two guineas, which will be returned on receipt of a *bonâ-fide* tender. The Council do not bind themselves to accept the lowest or any tender.

Sealed tenders, endorsed "Electrical Plant," to be delivered to the undersigned on or before Tuesday, July 22, 1913.

I. LINDOW,
Clerk to the Council.

Manor House, Shipley,
July 5, 1913.

### THE SOUTH INDIAN RAILWAY COMPANY, LTD.

The South Indian Railway Company, Limited, are prepared to receive tenders for the supply of :—

1. Carriage Fittings;
2. Files;
3. Locks and Padlocks;
4. Rivets, Nuts, etc.;
5. Steel Rails and Fishplates
   Rails 41¼lb., about 716 tons
   Fishplates for above rails about 28 tons.

Specifications and forms of tender may be obtained at the Company's Offices.

Tenders, addressed to the Chairman and Directors of the South Indian Railway Company, Limited, marked "Tender for Carriage Fittings," or as the case may be, must be left with the undersigned not later than 1 o'clock on Wednesday, July 23, 1913.

The Company is not bound to accept the lowest or any tender.

A charge, which will not be returned, will be made of 10s. for each copy of specifications Nos. 1, 2, 3, and 4, and 20s. for each copy of No. 5.

Copies of the drawings may be obtained on payment at the office of Robert White, Esq., M.Inst.C.E., Consulting Engineer to the Company, 3, Victoria Street, Westminster, S.W.

By order, NEVILLE PRIESTLEY,
Managing Director.

Company's Offices,
91, York Street, Westminster, S.W.,
July 8, 1913.

## COUNTY OF LONDON.

The London County Council invites tenders for the supply, etc., of High and Low Tension Switchgear required for various Tramways Sub-Stations.

Persons desiring to submit tenders may obtain the specifications, form of tender, etc., on application to the Clerk of the Council at the County Hall, Spring Gardens, S.W., upon payment to the Cashier of the Council of the sum of £2. This amount will be returnable only if the tenderer shall have sent in a *bonâ-fide* tender and shall not have withdrawn the same. Full particulars of the work may be obtained on personal application, and the drawings, specification, and other contract documents may be inspected at the County Hall before the payment of the fee.

The contractor will be bound to pay to all workmen employed by him in and about the execution of the contract, or any part thereof, wages at rates not less, and to observe hours of labour not greater, than the rates and hours set out in the Council's list, and such rates of wages and hours of labour will be inserted in and form part of the contract by way of schedule. Full particulars of the Council's Standing Orders on these matters are given in the *London County Council Gazette*.

Tenders must be upon the official forms, and the instructions therein must be strictly complied with. No tender received after 11 a.m. on Tuesday, July 22, 1913, will be considered.

The Council does not bind itself to accept the lowest or any tender, and it will not accept the tender of any person or firm who has withdrawn a tender after the same had been opened, unless the reasons for withdrawal were satisfactory to the Council.

JAMES BIRD,
Deputy Clerk of the London County Council.

County Hall, Spring Gardens, S.W.,
July 7, 1913.

## WANTED.

### DOUBLE-DECK CAR.

Wanted—Small Double-Deck Car, 4ft. 8½in. gauge, G.E. 58 Motors, B. 18 Controllers. Must be in good condition. Full particulars to Manager, Electricity Works, Glossop.

## WANTED.

Copies of THE TRAMWAY AND RAILWAY WORLD for September, 1906, October, 1907, and October, 1908. Apply to the Publishers, Amberley House, Norfolk Street, Strand, London, W.C.

## INCREASING NEED FOR A TRAFFIC BOARD.

The Select Committee of the House of Commons on motor traffic in London are now approaching the end of their work, and it is to be hoped that their report will be completed and published before the present session ends in August. The question which is now everywhere discussed in tramway and motor circles is, will the Committee recommend the creation of a Traffic Board? As the result of the agitation which arose at the end of last and the beginning of this year in consequence of the alarming growth in the number of accidents caused by motor vehicles and particularly by omnibuses, the Committee were appointed for the purpose of investigating the whole subject. The question of the causes of accidents is, however, intimately mixed up with that of street traffic and its regulation, so that the inquiry has ranged over rather a large field. To a small extent it has covered some of the ground surveyed by the Royal Commission on London traffic in 1905. As reports of the proceedings published in these pages from time to time show, tramway traffic and accidents were also investigated, and the evidence given by Mr. A. L. C. Fell and others emphasised the fact that tramways are much less productive of accidents to pedestrians than are motor omnibuses. Besides following the fixed path of the rails, the tramcar has the advantage of an efficient lifeguard. It was again shown by expert testimony that no practical lifeguard for the front of an omnibus has yet been devised. The side-guards to the rear wheels should prove useful, as many fatalities have been caused by the rear wheels. Witnesses for the omnibus companies did not appear to have anything very definite to suggest for the prevention of accidents, except the thorough training of drivers and the inculcation of caution. They did not favour paying the drivers by the day or week instead of by the journey, but there seems to be no doubt that in the public interest such a change should be made. The latter method would tend to minimise the inclination of drivers to take risks in order to make up for delays. What would be said if any tramway undertaking began to pay its drivers by the journey? The sooner the journey method is abolished the better. Evidence given by the police and by Government departments made it clearer than ever before that all these bodies are quite helpless in the matter of traffic regulation and control. Too many departments have powers and all the powers are limited. Many of the witnesses before the Committee advocated the formation of a Traffic Authority of some kind with full powers of control. This is following on the lines of the recommendation of the Royal Commission for a Traffic Board—a recommendation which the Government have steadfastly refused to carry out. If the present Committee recommend the formation of such a body the Government may at last be induced to move. Such a Board among other things should have the licensing of all vehicles plying for hire and should be able to limit the number of omnibuses where necessary, to prescribe routes which they may follow and those which they may not follow, and to set up some co-ordination between tramway and omnibus services. A few days ago the Prime Minister was urged by representatives of architects', surveyors', and engineers' institutions and of about fifty local authorities to appoint a general authority for the metropolis to co-ordinate suburban town-planning schemes so that the recommendations of the Royal Commission for the construction of main arterial roads through new districts might be carried out. This is only another branch of the work which should be entrusted to a Traffic Board. Mr. Asquith seemed impressed and promised to consider the matter further. It is to be hoped that he will be aided in his consideration by a strong report from the Select Committee.

## STUDY OF AMERICAN METHODS.

The spread of electric tramways in this country has had not a little to do with breaking down the old insular notion that Great Britain had nothing to learn from other nations. Now that tramways have been in operation in the British Isles for years, the cheap and frequent facilities which they afford have enlarged the inhabited area of towns and cities, thus throwing into the thoroughfares of the central termini a volume of traffic that in some instances is calling for the relief of congestion. Manchester is the first place to consider the question of remedial measures, and during the past eighteen months the tramways manager has prepared a valuable report which sets forth the conditions that have to be faced in that city. In order more fully to indicate the methods of relief, Mr. McElroy and Mr. H. Mattinson, the permanent-way engineer, on May 17, set out on a visit to the United States and Canada, in order to study up-to-date methods of street traction. In the first-mentioned country during the past decade a number of cities have resorted to subway and overhead tracks. The two officials returned to Manchester during the first week of the present month, after visiting New York, Boston, Newark, Pittsburg, Chicago, Toronto, and Montreal, a distance of nine thousand miles. This week the Glasgow Tramways Committee recommended that Mr. Dalrymple should journey to the leading cities of America, with a view to studying recent methods of tramway traction. The Glasgow manager already has an extensive acquaintance with American systems, for about seven years ago the Corporation permitted him to advise the authorities of Chicago on the question of municipalising

Digitized by Google

their transit facilities. Both the Manchester and Glasgow reports may be expected to contain some reference to the development during the past few years of Edison battery vehicles both for rail and street traction. The Glasgow electrical engineer is already experimenting in the work of his department with one of these batteries supplied by the Edison representatives in this country, and the Liverpool Tramways Committee are investigating the possibility of the system being utilised as a means of relieving the congestion experienced in the goods traffic from the docks. In the course of a conversation with newspaper representatives, Mr. McElroy stated that he and his colleague have obtained a great deal of information which will be of value to the Corporation in the solution of the serious problem they have in hand. Although the means of transit in the United States are in the hands of companies, they are subject to regulations and control by Commissioners, who act on behalf of the public. The method of appointing the Commissioners varies considerably in the various States, but usually they are appointed by the Governor of each State and by the municipality jointly. They are, of course, paid officials, and have some special qualification for their work. On the whole, these boards have proved exceedingly useful, and their co-ordinating and moderating influence has produced results that have greatly benefited the public. This American experience is of importance, in view of the efforts now being made to induce the Government to carry out the recommendations of the Royal Commission on London Traffic for the establishment of a Traffic Board. It is remarkable that in this country we have been so slow to appreciate the necessity of some unifying authority in a field where so much complexity exists as in metropolitan transport. Nothing but the blighting influence of party politics could so long have prevented the institution of an authority so urgently required.

## LONDON TRAMWAYS RENEWAL FUND.

NO SUM AVAILABLE—QUESTION ADJOURNED FOR TWO YEARS.

At the meeting of London County Council on Tuesday last, the Highways Committee presented a special report on the subject of the tramways renewal fund and general reserve fund. They pointed out that on June 23, 1908, the Council decided that provision should be made for renewals in respect of the tramways undertaking at the rate of two-thirds of a penny per car mile, and that the question of the adequacy of this provision should again be considered at the expiration of five years. The provision of two-thirds of a penny was the result of a careful computation based on the lives of certain parts of the undertaking consisting of the permanent way, cables, machinery at Greenwich station, petrol motor cars, petrol lorries, steam lorries, ticket vans, cable vans, and sundry horse vehicles. No provision was made in respect of renewal of cars, car traversers, cable ducts, tracks in the car sheds and foundations for the permanent way and the renewal of certain sub-station machinery, switchgear and sundry plant and tools, as work of this nature is paid for directly out of revenue. Of a total expenditure to March 31 last of £7,521,030 on items the repayment of which was spread over 25 years, only about £2,074,000 was covered by the renewals fund, the remainder being renewed out of revenue account.

The recent falling off in traffic receipts owing to the great increase in motor omnibus competition had the effect of bringing to a negligible figure the surplus for 1912-13 to be added to the renewals fund, and the surplus for the current year would be very small unless conditions were materially altered. The question of the rate per car mile required became therefore for the moment an academic one. At the same time it was desirable to review the position. Taking the capital cost of the items for which renewals provision should be made, and providing (by cumulative annuity) for the renewal, the annual provision would be as cited below.

| | Annual provision for the renewal. | Amount per car mile. * |
|---|---|---|
| | £ | d. |
| Permanent way—Surface work only, excluding slot rails, but including electrical equipment | 116,304 | .498 |
| Generating station machinery and plant | 13,235 | .057 |
| Sub-station machinery and plant | 6,566 | .028 |
| Cables and feeder pillars | 9,497 | .041 |
| Machinery and plant in central car repair depot and other depots | 1,319 | .006 |
| Motor cars, lorries, wagons, carts, etc. | 1,182 | .005 |
| Total | £148,103 | .635 |

* Based on 56,000,000 miles.

It was very difficult to estimate the amount required for renewals beyond the next five years, but it was considered that an average expenditure of about £139,000 a year, equal to .595d. per car mile, would be sufficient. On March 31 last the renewals fund amounted to £633,010, while in addition there was the general reserve fund amounting to £273,786. In view of the impracticability under existing conditions of estimating the amount that would be available for renewals there appeared to be no practical advantage in revising the basis at present, and the Committee were of opinion that there should be carried to the renewals fund the actual surplus each year, leaving the question of a possible revision of the basis for a further period of two years. In regard to the reserve fund, nothing was available to be carried to it for the year 1912-13, and it was not estimated that there would be any sum available for the year 1913-14. It therefore did not appear necessary that any decision as to the constitution of this fund should be come to at present. The Finance Committee agreed with the Highways Committee, and said that they had adjourned the matter of the reserve fund for two years.

The Council debated this report at considerable length, but no new facts were disclosed. The policy recommended by the Committees was eventually approved.

## PRESENTATION TO MR. H. E. BLAIN.

A largely attended gathering of the West Ham tramways official staff and friends took part in a farewell social to Mr. and Mrs. H. E. Blain, on Wednesday evening last, in the recreation room of the tramways depôt. Mr. Blain was presented with a large and exceedingly handsome silver-mounted polished-oak case, containing a three-bottle tantalus, with accompanying glasses, a card outfit, and a smoker's compendium, duly stocked. The presentation was made on behalf of the official staff by Mr. F. Eggington, the principal assistant, who referred in feeling terms to the relationship between Mr. Blain and the members of the staff, and expressed their deep sorrow at his departure from West Ham, whilst heartily congratulating him upon his new appointment with the London underground railways. Mr. Blain, in acknowledging the presentation, said that it had come as a complete surprise to him, and that he would value the gift as a most kindly remembrance of ten years' work in that busy borough. He thanked Mr. Eggington and the staff for their support, and extended in their name as well as his own a very warm and hearty welcome to the new tramways manager, Mr. J. S. D. Moffet, of Rochdale, whom he described as a capable, straight, and courteous gentleman, and whom he sincerely wished a happy and prosperous time in West Ham. Mr. Moffet, who was present with his wife at the function, replied in suitable terms, thanking the staff for their welcome, and appealing for their loyal support, which he promised to do everything possible to deserve.

Mr. J. W. Beauchamp, the borough electrical engineer of West Ham, referred to the personal loss he felt he was sustaining in the departure of Mr. Blain, and testified to the valuable assistance he and his predecessors had received from him in the work of the sister trading department. Mr. W. C. Ullmann, tramways manager, East Ham, also voiced the regret felt in the tramway world, particularly amongst the managers of the Metropolitan area, at the change Mr. Blain was making, but cordially wished him success in his new sphere.

## METROPOLITAN ASSOCIATION OF ELECTRIC TRAMWAYS MANAGERS.

The members of the above Association on Friday evening, July 4, entertained Mr. H. E. Blain, their late chairman, at dinner at the Municipal and County Club, Whitehall Court, S.W., when there were present Messrs. Ullmann (East Ham), vice-chairman, Fell and Bruce (London County Council), Schofield (Leyton), Harvey (Ilford), Coveney (Erith), Stokes (Bexley), Murray (Walthamstow), Hammond (M.E.T.), Mason (South Metropolitan), and Goodyer (Croydon), hon. secretary. Mr. H. England (Wakefield) was also present.

Mr. W. C. Ullmann, in proposing the toast of the evening, and expressing the general regret of all present at the circumstances which had brought about Mr. Blain's severance from Metropolitan Municipal Tramways operation, and, more particularly, his connection with their Association, of which he was the chairman and prime founder, spoke feelingly of the many excellent qualities possessed by their guest. He stated that no tramways manager in the Metropolitan area had done more to support the usefulness of the Association, and the cordial relations between its members, than Mr. Blain.

Mr. T. B. Goodyer, in expressing his agreement with what Mr. Ullmann had said, remarked that, as hon. secretary of the Association for several years past, and in connection with many other matters, he had been in very close touch with Mr. Blain, and, personally, would look upon his departure as a personal loss. In congratulating him upon his new appointment, he said that his new employers would find they had gained a "real live man."

Mr. Fell, Mr. Bruce, Mr. England and others also bore testimony to the high esteem in which Mr. Blain was held.

**The Metropolitan Electric Tramways Athletic and Social Club** will hold their annual sports meeting at the Black Bull, Whetstone, on Thursday, July 17.

## PRIVATE BILL LEGISLATION.

MEXBOROUGH AND SWINTON RAILLESS TRACTION.—The local Tramways Company's Bill, which had passed the House of Commons, came before Lord Newton's Committee of the House of Lords on July 10-11. The proposals were for a route from Mexborough to Conisborough, and from Mexborough to Bolton Road. Mr. W. B. Cownie, managing director of the company, spoke of the advantage the routes would be to the district, particularly to the miners. The local authorities were always quarrelling, and were not likely to agree on a scheme. Mr. Wedderburn, K.C., said that, subject to the approval of the ratepayers, Mexborough would undertake to promote a Bill next year.

RHONDDA RAILLESS TRACTION.—Following its passage through the House of Commons the National Electric Construction Company's Railless Traction Bill on July 7-8 was considered by a Committee of the House of Lords, presided over by Lord Ribblesdale. In reply to the Chairman, Mr. Knox, K.C., admitted that the undertaking was a by-product of the Rhondda Tramways Company. Mr. J. E. Waller and Mr. W. B. Cownie gave evidence, the latter stating that if conditions were put upon the company which would prevent them geting a clear 5 per cent. on their capital expenditure, they could not go on with the undertaking. He did not think the scheme could stand the contribution of three-eighths of a penny per car mile. On behalf of Llantrisant Council an effort was made to induce the Committee to impose further responsibilities in addition to a contribution of £1,333 which they are to be required to make. The Committee decided that the Bill might proceed as it was, and refused to grant the Llantrisant Council powers to purchase. Having approved the other clauses, the Committee ordered the Bill to be reported for third reading.

## L.C.C. TRAMWAY MATTERS.

ADVERTISING OF TRAMWAY SERVICES.

At last Tuesday's meeting of the London County Council the Highways Committee reported that they had considered the question of advertising the facilities afforded by the tramways, and they suggested that illuminated advertisements should be displayed on certain tramway buildings and other sites. The Committee proposed to obtain tenders for the provision of the signs required from selected firms.

RECONSTRUCTION OF HORSE TRAMWAYS.

In the opinion of the Committee steps should be taken to carry out reconstruction for electric traction of the horse tramways in Ball's Pond Road between Southgate Road and Kingsland Road, a distance of about one-third of a mile. They proposed that tenders should be invited from firms at present carrying out tramway work for the Council.

TRAMCAR V. OMNIBUS.

The Committee reported an interesting case. On May 16 last William Banks, a driver, employed by the London General Omnibus Company, stopped his omnibus suddenly without any warning on the tramway track at East Ham Town Hall. The driver of one of the County Council's tramcars which was following had to apply his brakes sharply to avoid a collision, thus causing the conductor to be thrown against the doorway. The tram driver sounded his gong, and although there was room on the near side for the omnibus no notice was taken, and when the omnibus was eventually driven to the near side the car had been delayed for three minutes. The omnibus driver was asked for particulars, but refused his name and address until a constable was called, which caused a further delay of five minutes. Summonses were subsequently issued against the omnibus driver for driving to the common danger, under the Motor Car Act of 1903, and for obstructing the Council's car. He was fined £3 under the first and £1 under the second summons, and was ordered to pay 15s. costs to the Council.

INTERNATIONAL TRAMWAYS CONGRESS.

The General Purposes Committee reported that the Highways Committee were of opinion that the Council should become a member of the International Tramways Congress, and had asked that their chairman or vice-chairman should be appointed to represent the Council at the Congress to be held in 1914. The expenditure involved was £12 for the annual subscription. The General Purposes Committee accordingly recommended that the Council should become a member of the Congress, and that the chairman or vice-chairman of the Highways Committee represent the Council at the Congress.

The various recommendations were adopted.

LIVERPOOL ROAD TRAMWAYS.

Considerable debate took place on an adjourned report of the Highways Committee recommending the discontinuance of the horse tramways car service in Liverpool Road, Islington, and eventually Sir Edward White accepted an addition to the recommendation proposed by Mr. H. H. Gordon as follows:—"And that it be an instruction to the Committee to consider and report as to the desirableness of utilising the Liverpool Road route as part of a through route for cars between the City and Highgate and other northern termini."

**Bell Boys on Manchester Cars.**—A correspondent of a London newspaper has written in terms of high praise of the Manchester tramways. Amongst other things he mentions that on all the busy routes a car has not only the conductor but also a youth whose business it is to stop the car when required, and to be on the look-out for passengers.

## MISCELLANEOUS NEWS AND NOTES.

**A Petrol Tramcar for Stirling.**—Subject to the consent of the local authorities being given the Board of Trade have authorised the use, as an experiment, of a petrol-propelled tramcar on the system of the Stirling and Bridge of Allan Tramways Company.

**Tramwaymen's Tug-of-War Championship.**—At the annual sports promoted by the London United Tramways Athletic Club, at Brentford, on July 9, was decided a tug-of-war, open to the tramways of the United Kingdom, for the Lady Robinson Challenge Cup. Result:—First round: London United (Hanwell) beat City of Hull Tramways by 2 pulls to 1; London United (Fulwell) beat Bournemouth Tramways by 2 pulls to nil. Final: Hanwell beat Fulwell by 2 pulls to nil.

**Three Halfpenny Stages in a Penny Ride.**—Replying to a question at a meeting of Manchester Corporation, on July 2, as to why halfpenny fares had not been adopted throughout the city, Alderman H. Brown said that the committee wished to find out what the result would be of dividing penny fares into two or three halfpenny fares. In the course of two or three months they would know whether they ought to launch out and divide the penny fares into two halfpenny or three halfpenny fares.

**Illuminated Cars at Manchester and Oldham.**—On the occasion of the visit of the King and Queen to Manchester on Monday next, a decorated and illuminated tramcar will run over the principal tramways in the evening, and also on Tuesday evening. An illuminated car, followed by a decorated King George V. car, will run at Oldham this (Saturday) evening and also on Monday. On the suggestion of the manager, the tramwaymen in this town are to receive double wages for working on July 12, while men not on duty will receive a day's wages.

**Concessions to Reading Employees.**—Recently, Mr. G. F. Craven, the general manager of the Reading Corporation tramways, interviewed a deputation of motormen and conductors, who desired him to put before the Tramways Committee several requests relating to their pay on Bank holidays and Sundays, and also the rate of pay of conductors acting as motormen. The result of this was that the July meeting of the Council approved the Tramways Committee's recommendations to pay motormen and conductors at the rate of double time on Christmas Day and time and a half on Good Friday, and to pay conductors acting as motormen at the rate of 5¾d. per hour during the first year, 6d. per hour for the next six months, 6¼d. for the following year, rising at the end of 2½ years to 6½d. The Council further agreed to allow the conductors an increase in their reporting time of five minutes.

**Trackless Car and Omnibus Scheme for Reading.**—Some months ago a sub-committee was formed to consider the advisability of extending the tramways by establishing either a motor omnibus service or a trackless trolley system, chiefly to serve the districts incorporated in the borough of Reading. The sub-committee recently presented the report to the Tramways Committee, who approved of the proposals, and, with an extensive report by the tramways manager, submitted it to the Council on July 4 for their consideration. The total scheme comprises a tramways extension of about a quarter of a mile, and four trackless trolley routes of slightly more than eight miles total length, with a further provision for motor omnibuses for trying new routes. The total cost of the scheme is over £26,000, and the Council decided that it was necessary to go into Committee over the question and arranged for a meeting on July 10.

**Competition in Oldham.**—The Tramways Committee have discussed the question of carrying passengers on the initial and last journeys of the motor omnibuses from the depôt to Moorside and back. It was proposed to allow the public to travel from the Star Inn to the Moorside tramway terminus and *vice versa* for a six-penny fare. It was contended by several members of the Committee that the 'buses would not secure passengers at that fare, and the Chairman explained that the Committee did not want to rob the tramway service, but he knew many people who would pay that fare. The manager (Mr. Dugdale) explained that people paid 2d., 3d., and 4d. to ride in wagonettes from Moorside to Grains Bar and that while the motor 'buses were running. If the Committee charged the ordinary car fare people would hang back for the motors, and the cars would be running empty in the meantime, because there was no scheduled time for starting. They went by the amount of traffic. The Committee decided to charge 3d. and 6d. fares.

**Commercial Motor Vehicle Exhibition.**—Only a few of the Municipal Tramway Committees have as yet appointed representatives to attend the Commercial Motor Vehicle Exhibition, which will be held at Olympia from Friday next, July 18, to Saturday, July 26. Among those who propose to attend are Mr. Wm. Clough (Bury); Alderman Shentall, chairman, Councillor Clayton, vice-chairman, Councillor Clark, and Mr. R. L. Acland, engineer and manager (Chesterfield); Mr. T. B. Goodyer, general manager (Croydon); Alderman C. Northfield, Mayor of East Ham, Alderman O. R. Anstead, chairman of the Works Committee, and Mr. J. E. W. Birch, borough engineer and surveyor (East Ham); Mr. A. Coveney, general manager (Erith); Mr. L. E. Harvey, general manager (Ilford); Mr. Frank Ayton, chief engineer and manager (Ipswich); Mr. J. Gottschalk, general manager (Northampton); Councillor R. H. Swain, chairman, and Mr. J. Aldworth, general manager (Nottingham), Mr. J. W. Dugdale, general manager (Oldham); Mr. A. R. Fearnley, general manager (Sheffield); Councillor J. Farley, chairman, and Mr. R. R. Greene, general manager (Wallasey); Mr. R. L. Horsfield, general manager (Walsall); Mr. W. A. Luntley, general manager (Wolverhampton).

Digitized by Google

**Request for Illuminated Indicators.**—Stoke-on-Trent Council have called the attention of the Tramway Company to the desirability of each car being fitted with an indicator capable of being illuminated at night, stating the destination or route of the car.

**Reopening of Glasgow Harbour Tunnels.**—The three tunnels under the Clyde which were closed in 1907 owing to ferry boat competition immediately above the line of the tunnels, were re-opened for traffic on July 1. There are three tunnels, two feet apart, all on the same level under the Clyde. The centre tunnel is intended for passenger traffic only, and meantime will not be in use. The west tunnel is used for north-going traffic, and the east for south-going traffic. There are six lifts in each shaft, but generally four lifts only are operated and one kept spare. An agreement has been arranged between the Tunnel Company and the Corporation for the reopening to take place for one year, with an option to the Corporation to purchase the undertaking for £100,000. Members of the Statute Labour Committee and the Tramways Committee attended the opening ceremony, and made an inspection of the works under the guidance of Mr. J. Dalrymple, the tramways manager, and the company's officials.

**The Trolley Wire Design Action.**—Vice-Chancellor Smith, K.C., on July 8 gave his decision in the case in which the British Insulated and Helsby Cables, Limited, of Prescot, near Liverpool, sued the London Electric Wire Company and Smiths, Limited, of the Anaconda Works, Salford, for an alleged infringement of registered designs for wires for overhead trolley tramways, and asked for an injunction to restrain defendants from further use of their copyright. His Honour remarked that one of the designs was registered on March 7, 1908, and had been called in the case design A. The other was registered on April 9, 1908, and had been known as design B. Both wires were grooved, and were about half an inch broad between the lower shoulders at their broadest part, being rather less from the top of the semi-circle to the lowest part of the segment. Judging by the eye alone, to which test he was driven, he was unable to see such a distinction between plaintiffs' designs and the others as would enable him to say that plaintiffs' designs were novel. If design B was valid he held that there had been no infringement, and there would be judgment for defendants with costs.

**Inauguration of a Portsmouth Extension.**—Great interest was displayed at Portsmouth on July 4 at the opening of an extension of the tramways from the Recreation Ground and Commercial Road. The decision of the Council to construct tramways to the populous district of Stamshaw was mainly due to the efforts of Councillor J. Timpson, vice-chairman of the Tramways Committee, whose health was proposed by the Mayor (Alderman J. H. Corke), the chairman of the committee, during a few speeches following the inaugural ride. Mr. V. G. Lironi, the electrical and permanent way engineer, at the request of the mayor, described the work connected with the extension, which has cost £10,750, and details as to the service to be run were given by Mr. W. R. Spaven, the manager. Councillor Timpson paid a tribute to the work of Mr. Spaven, Mr. Lironi, and Mr. Roscoe, the assistant electrical engineer, and Mr. Lewis, the civil engineer, for the energy they had displayed in pushing on the work. He also proposed the health of the mayor, which was also heartily honoured. His worship was presented by Alderman Power with a basket of roses grown by Mr. H. Edmonds on waste land reclaimed by the Corporation, after it had been purchased by Alderman Corke and the late Sir W. King without consulting the Council.

**Croydon Tramway Sports.**—The annual sports meeting of Croydon Corporation Tramway Athletic Club took place on Wednesday of last week (July 2), and was as usual an interesting and enjoyable occasion. The Brighton Railway Athletic Club ground, where the sports were held, is one of the best in South London. Its situation gives extensive views, and with the fair weather that prevailed for the greater part of the afternoon the sports were witnessed in very pleasant conditions. About £150 in prizes, cups, and other trophies were offered for competition, and the numerous events were keenly contested. The tug-of-war teams were exceptionally well matched, and some heroic contests took place. The prizes were distributed by the Mayoress. Mr. T. B. Goodyer, the popular general manager of the Croydon tramways and president of the Athletic Club, entertained a large company to luncheon at Bennett's restaurant. The Mayor of Croydon in a few remarks alluded to the difficulties they were now passing through in Croydon owing to the competition of motor omnibuses, and mention there were 163 of these vehicles on the Croydon tramway routes against 75 tramway cars, which alone were amply sufficient to deal with the traffic. The motor omnibuses, however, made up their losses from large earnings in the central districts of London. It was unfair that the Council were obliged to maintain the streets for the omnibus service. He alluded to the excellent work which Mr. Goodyer had done in particularly trying circumstances, and spoke of the esteem in which he was held by the Tramways Committee. No tramway manager could do more than he was doing.

## WEEKLY TRAFFIC RETURNS.

The official traffic returns of 67 of the principal undertakings of the United Kingdom for the week ended July 5 amounted to £262,340, or £18,443 more than in the corresponding week last year, while the track mileage was 2,712, or 52 more than for the corresponding week. The receipts were at the rate of £96 14s. 8d. per track mile, an increase of £5 0s. 11d. per mile as compared with last year.

## PERSONAL.

**Mr. J. S. D. Moffat,** general manager of Rochdale Corporation tramways, was on July 8 appointed tramways manager to the West Ham Corporation. The salary is £550 per annum, rising to £700.

**Mr. R. Cook,** for eleven years a conductor, motorman, and inspector on the Doncaster tramways, has been presented with a marble clock and bronzes by the electricity and tramways staff on his retirement to take up an appointment as wagon inspector at Bentley Colliery. Mr. G. A. Roberts, assistant engineer, made the presentation, in the absence of the electrical engineer.

**Mr. J. Barnard** has been unanimously appointed general manager of the Bolton tramways at a salary of £400, rising to a maximum of £600. Mr. Barnard was previously traffic manager. The vacant position of engineer and manager of the electricity department has been filled by the appointment of Mr. W. J. H. Wood at a salary of £400, rising by annual increments of £50 to £600. Mr. Wood had previously held the position of station engineer.

**Mr. J. Carter,** purchasing agent to the District, London Electric and Central London Railways, and to the London General Omnibus Company, died on Saturday last after a long illness.

## CONTRACTS AND ORDERS.

**Beecroft and Wrightman, Limited,** have received a contract to supply hard wood paving blocks to Bradford tramways.

**Mr. W. Dowling** has obtained a contract for the construction of a permanent way depôt for the Belfast tramways, at £2,066.

**Sturtevant Engineering Company, Limited,** are supplying a wet-air filter for turbo-generators to the Belfast electricity works, at £360.

**Walter Scott, Limited,** have been awarded a contract for the supply of Sandberg steel rails to Bournemouth tramways, at £5,535.

**St. Helens Council** have awarded a contract to the British Westinghouse Electric and Manufacturing Company, Limited, for a rotary converter.

**The M. and G. Truck and Engineering Company, Limited,** of 124 to 127, Minories, London, E.C., have received an order from Birmingham Corporation for maximum traction trucks for 75 cars.

**Commercial Cars, Limited,** of Luton, have orders in hand for motor passenger vehicles for Bath Electric Tramways, the Cheltenham Light Railway Company, and Grimsby Street Tramways.

**Leeds Tramways Committee** have recommended that the following tenders be accepted:—20 to 40 trucks for new cars, at £42 12s. 6d. each, J. G. Brill and Co.; 20 electrical equipments, with option to take a further 20, Dick, Kerr and Co.

**Doncaster Council** have allotted the following contracts:—Willans and Robinson, Limited, turbine and condenser, £3,308; British Westinghouse Company, Limited, one 350 kw. rotary converter, £1,074, and one 600 kw. rotary converter, £1,510.

**Manchester Council** have placed contracts as follow:—Foundations and floor extensions at engine house, etc., for 15,000 kw. turbo-generator, William Gornall; for cable, W. T. Henley's Telegraph Works Company, Limited, B.I. and Helsby Cables, Limited, C. Macintosh and Co., Limited, and the Electrical Engineering and Equipment Company, Limited; supply of pitch to the tramways department, Simons-Carves, Limited.

**Sheffield Council** have awarded the subjoined contracts:—Motor-driven surface condensing plant, capable of dealing with 75,000lb. of exhaust steam per hour, £2,647, and 10 per cent. allowance for contingencies, and with a further allowance of £100 for the old condenser, British Westinghouse Company, Limited; hand travelling crane of 15 tons capacity, £375, Chatteris Engineering Works Company; direct-acting boiler feed pump, £190, J. F. Hall and Son, Limited.

**London County Council** have accepted the following tenders:—Stern Sonneborn Oil Company, cylinder oil for Greenwich power station up to May 31, 1914, 1s. 5½d. a gallon, less 2½ per cent. monthly discount; C. Price and Co., machinery oil for Greenwich power station, £11 10s. a ton; W. Cory and Son, Limited, removal of ashes from Greenwich power station for one year from August 1 next, 1s. 3d. per cubic yard; W. T. Henley's Telegraph Works Company, Limited, 880 yards of low tension vulcanised bitumen insulated cable, £212 13s. 4d.; British Insulated and Helsby Cables, 50 cwts. of D.C.C., H.C.C. wire, £221 13s. 4d.

**St. Petersburg Tramway Extensions.**—On June 25 St. Petersburg Council awarded contracts as follow for the construction of new tramways during 1914-15:—

(1) To the Kolomensk house for excavations, rectification of streets, and construction of the lines, if they will accept the reduced price of 4,081,040 roubles (£425,500). Failing agreement with this offer, fresh tenders will be called for, and should these not induce lower offers, the work will be done under the direction of the town (2) To the A.E.G. for the construction of the cable ways and cable systems at 1,229,000 roubles (£130,000 and for aerial cables at 1,164,326 roubles (£123,000), and for the equipment of the Polvustrovsky sub-station if the house will accept 101,651 roubles (£10,700), failing which the order will go to the Dynamo Company. (3) To the Dynamo Company for the supplementary equipment of the St. Petersburg and Podyatchesky sub-station at 115,000 roubles (£12,200).

As to the rolling stock orders already published, there is a likelihood that the order for trailers will be withheld from the Swedish house and given to a Russian one, owing to the protests raised against the order going abroad. The difference in favour of the Swedish tender is 47,000 roubles (£5,000) on a total of 1,026,000 roubles (£108,000). The Russian Metallurgical Combine, Prodameta, will supply the rails at a maximum of 1,250,435 roubles (£132,000) and the house of Pomerantr will supply the sleepers at a cost of 218,381 roubles (£23,100).

Digitized by Google

**Glasgow Council** have been recommended to accept the following tenders :—Special trackwork, Lorain Steel Company and E. Allen and Co.; ten-ton travelling crane for Whitevale sub-station, Chambers, Scott and Co.; teak planks, J. Watt Torrance and Co. and Robinson Dunn and Co.; mica, Micanite and Insulators Company, Limited; condenser for a new turbine at Pinketon power station, Messrs. Willans and Robinson; engine, J. Jackson and Co. For the supply of tramway stores the following contracts have been made :—E. W. Bliss Company and W. C. Yuille and Co., gear wheels; W. MacFarlane and Co., c.i. gutters; British Westinghouse Company, car equipments, motors, etc.; British Thomson-Houston Company, car equipments and controllers.

## FINANCIAL REPORTS AND MEETINGS.

**The British Electric Traction Company.**—The receipts of all the associated companies of the British Electric Traction Company for the week ended July 4 amounted to £53,069. Upon such of the lines as were working both last year and this year the receipts show an increase of £4,180 upon the week.

**Capetown Consolidated Tramways and Land.**—A balance of £1,678 is shown to the debit of profit and loss account for the current year, which, added to the balance brought forward from 1911 of £4,628, makes a total of £6,306 to be carried forward. No dividends have been declared by the subsidiary companies during the past year. The Camps Bay Tramway Company shows a profit of £2,973 for the same period. The Cape Provincial Government has taken the initiative in formulating a scheme for the unification of the municipalities of the Cape Peninsula—such unification will, in all probability, embrace Camps Bay. The whole matter is now under negotiation.

**Coventry Corporation Tramways.**—The statement of accounts issued by the tramways department of Coventry Corporation covers a period of fifteen months ending March 31, 1913, the full period since the Corporation acquired the tramways from the company. The report for the past twelve months shows that there was a total expenditure of £24,118 (or 5.822d. per car mile) and the gross profit was £15,035 (or 3.629d. per car mile). The total earnings were £39,153 (or 9.451d. per car mile). The percentage of working expenses to receipts was 61.6. The gross profit for the three months ended March 31, 1912, amounted to £2,949, making a total gross profit for the fifteen months of £17,984. This amount has been appropriated as follows :—Interest, £10,379; sinking fund (eight months), £3,286; reserve in lieu of sinking fund for seven months, £2,875; balance, £1,443. The total capital expenditure stands at £211,208, and the Corporation have 15¼ miles of track and 40 cars. During twelve months the energy consumption for all purposes amounted to 1,533,212 units, the cost per unit being .450d. The consumption per car mile was 1.44 units. The total number of car miles for the year was 904,207, and the car hours 154,919. The passengers amounted to 7,630,065. The population served is 135,000, and the average journeys per head averaged 57.

## MANUFACTURERS' PUBLICATIONS.

**The Maudslay Motor Company, Limited,** have issued a handsome catalogue on industrial and public service vehicles. The catalogue contains a description of a Maudslay engine with drawings and numerous photographic illustrations of various parts, the price list of the chassis and specifications of the respective types, and illustrations of numerous types of lorries, vans, chars-a-bancs and omnibuses. Users of commercial vehicles will find running costs which are given for machines of various capacities of much interest. A full list of spare parts concludes a publication of more than usual interest.

**Turners and Manville, Limited,** have issued a small pamphlet on "Sindanyo," a fireproof substitute for wood, slate, marble and fibre. This material is made principally from asbestos fibre, and has the physical characteristics of hard wood. It possesses great mechanical strength, and may be cut with an ordinary wood or hack saw, or drilled with a twist drill. It is manufactured in two grades, plain and ebony, and can be supplied in sheets, rods, tubes, or in moulded form. The plain grade is recommended for ordinary purposes, including tramcar linings. The material is thoroughly fireproof, and it is, therefore, useful for warehouse or factory doors, cabinets, etc.

**Robert Kearsley and Company, Limited,** of Ripon, have issued a handsome brochure (10¼in. by 8¼in.) consisting of illustrations of their works and offices. The object of the book is to give customers an insight into some of the daily work of a large varnish and paint factory, and to show the resources and organisation of the firm, which was founded in 1837, and has thus a history of seventy-five years. The illustrations show various parts of the works, which cover over five acres. One of the views gives the interior of the well-equipped electric power house, supplying power to the works, and another interesting illustration is that of the giant storage tanks, having a capacity of 60,000 gallons. Varnishes of all grades are made for use on railways, railway and tramway rolling stock, locomotives, motor cars, and for decorative work, etc. A large part of the factory is devoted to the manufacture of dry colours and the grinding of paints, ranging from the heavy oxides as used by engineers, to the finely ground colours for use on the best motor car work. The works include a well-equipped laboratory, paint shop, testing department, and show rooms, all of which are illustrated.

## COPPER AND ALUMINIUM MARKET.

July 11, 1913.

## WEEKLY LIST OF TENDERS INVITED.

### CITY OF NORWICH.

The Electricity Committee invite tenders for the supply of

1. One 3,000 kw. Turbo-Alternator and Surface Condensing Plant.
2. Rotary Converters.
3. E.H.T. Switchgear.

Specifications, forms of tender, and conditions of contract may be obtained from Mr. F. H. Long, City Electrical Engineer, Corporation Electricity Works, Norwich.

Sealed tenders, addressed to the Chairman of the Electricity Committee at the Electricity Works, and endorsed "Tender for ....," to be delivered not later than 11 a.m. Tuesday, August 12.

The Committee do not bind themselves to accept the lowest or any tender.

A. H. MILLER,
Town Clerk.

Guildhall, Norwich,
July 16, 1913.

### COUNTY BOROUGH OF WARRINGTON.

ELECTRICITY DEPARTMENT.

The Electricity and Tramways Committee of the County Borough of Warrington invite tenders for E.H.T. Feeder Panel.

Specification and form of tender can be obtained from the undersigned on payment of one guinea, which will be returned on receipt of a *bonâ-fide* tender. Five shillings each will be charged for extra copies of specification.

Tenders, addressed to the Chairman of the Electricity and Tramways Committee, Town Hall, Warrington, must be sealed with wax and endorsed "Tender for E.H.T. Feeder Panel," and delivered not later than 12 o'clock noon on Wednesday, August 6.

The lowest or any tender will not necessarily be accepted.

F. V. L. MATHIAS,
Borough Electrical and Tramways Engineer.

Howley, Warrington.

### COUNTY BOROUGH OF WARRINGTON.

ELECTRICITY DEPARTMENT.

The Electricity and Tramways Committee of the County Borough of Warrington invite tenders for twelve months' supply of Earthenware Conduit.

Specification and form of tender can be obtained from the undersigned on payment of one guinea, which will be returned on receipt of a *bonâ-fide* tender. Five shillings each will be charged for extra copies of specification.

Tenders, addressed to the Chairman of the Electricity and Tramways Committee, Town Hall, Warrington, must be sealed with wax and endorsed "Tender for Earthenware Conduit," and delivered not later than 12 o'clock noon on Wednesday, August 6, 1913.

The lowest or any tender will not necessarily be accepted.

F. V. L. MATHIAS,
Borough Electrical and Tramways Engineer.

Howley, Warrington.

### CORPORATION OF BLOEMFONTEIN, O.F.S., SOUTH AFRICA.

RAILLESS ELECTRIC TRAMWAYS.

Tenders are hereby invited for the supply and equipment of a system of Electric Railless Tramways within the City of Bloemfontein, Orange Free State, South Africa, including:—

Section A.—Supply of Poles, Brackets, etc.
Section B.—Erection of Poles, supply and erection of all Overhead Lines, Section and Feeder Pillars, Feeder Cables, etc.
Section C.—Supply and erection of Two 250 kw. Converting Machines, 2,100 V.A.C. 50 Cycles to 550 V.D.C., with all adjuncts, etc.
Section D.—Supply and erection of complete Switchboard.
Section E.—Supply and delivery of Ten Railless Electric Cars.

Tenders for the whole of the work, or for any one section, or portion of a section, must be delivered to the Agents of the Town Council, Messrs. Davis and Soper, 54, St. Mary Axe, London, E.C., not later than 12 noon on the 15th August, 1913.

The Council does not bind itself to accept the lowest tender, or any tender, but reserves to itself the right to accept the whole of any tender or any section or portion of a tender.

Plans and specifications, together with conditions of contract, may be obtained on payment of £5 stg. (which will be refunded on receipt of a *bonâ-fide* tender) at the office of the Agents, Messrs. Davis and Soper, 54, St. Mary Axe, London, E.C., on and after the 16th July, 1913, or at the office of the City Engineer, Town Hall, Bloemfontein, on and after the 28th June, 1913.

By order, W. A. KOLLER,
Town Clerk.

### BOURNEMOUTH CORPORATION TRAMWAYS.

The Tramways Committee of the County Borough of Bournemouth are prepared to receive tenders not later than August 27, 1913, for:—

Reconstruction of Permanent Way (equal to about 3 miles single track).

Specifications, quantities, and forms of tender may be obtained on application to the undersigned on payment of a deposit of £2, which will not be returned except on receipt of a *bonâ-fide* tender.

Additional copies may be had on payment of £1 1s. each, which will not be returned.

The Committee do not bind themselves to accept the lowest or any tender.

I. BULFIN, B.A., A.M.I.C.E., M.I.M.E., M.I.E.E.,
General Manager.

Tramways Offices, Bournemouth.

### CORPORATION OF MIDDLETON.

SWITCHBOARDS.

The Corporation are prepared to receive tenders for the supply of Lighting Switchboard and renewals to Traction Switchboard.

Copies of specification, etc., can be obtained from Mr. S. Pauls, Electrical Engineer, Townley Street, Middleton. Sealed tenders, addressed to the Chairman of the Electricity Committee, endorsed "Switchboard," to be delivered to the undersigned on or before mid day Monday, the 28th day of July, 1913.

The Corporation do not bind themselves to accept the lowest or any tender.

F. ENTWISTLE,
Town Clerk.

Town Hall, Middleton.

## WANTED.

### DOUBLE-DECK CAR.

Wanted—Small Double-Deck Car, 4ft. 8½in. gauge, G.E. 58 Motors, B. 18 Controllers. Must be in good condition. Full particulars to Manager, Electricity Works, Glossop.

Digitized by Google

## POSITIONS VACANT.

### COVENTRY CORPORATION TRAMWAYS.

CHIEF CLERK AND ACCOUNTANT.

Applications are invited for the position of Chief Clerk and Accountant to take charge of the accounts and clerical staff. Salary £180 per annum, increasing to £200 after 12 months' satisfactory service.

Applications should state experience, qualifications and be accompanied by copies of not more than three testimonials, and endorsed "Chief Clerk," and must be sent in not later than Thursday, July 31, 1913, addressed to the undersigned.

T. R. WHITEHEAD,
General Manager.

Priestley's Bridge Depôt, Coventry,
July 18, 1913.

### ERITH URBAN DISTRICT COUNCIL.

ELECTRICITY DEPARTMENT.

CHARGE ENGINEER.

Applications are invited from qualified persons for above position. Applicants must possess high-tension three-phase experience and be conversant with details of a modern A.C. station. Salary 40s. per week, rising (upon satisfactory service) by annual increments of 2s. 6d. per week to a maximum of 50s.

Applications, stating age, experience, and present and past positions, with copies of testimonials, to be addressed to the Engineer and Manager, Electricity Offices, Walnut Tree Road, Erith, S.E.

### "LIVE" MAN.

Required, Smart Man, capable of dealing with work necessitating a thorough knowledge of theory and practice of number. Must not be bound down to mathematical text-book methods, but should possess advanced calculative ability, and be able to apply same in practice. A real "live" man, with some organising capacity, and one who can carry through to a completion, mathematical schemes and schedules. Salary and particulars on application, by letter, to Box 4019, Willing's, 125, Strand, W.C.

## FOR SALE.

### BRAKES.

## TRAMWAY EMPLOYEES' CONDITIONS.

It would be a matter for surprise if the industrial unrest witnessed during the past few months left tramway employees unaffected. Those in the Black Country were wise enough to accept the concessions offered by the British Electric Traction Company. The Lanarkshire Tramway Company have issued a notice intimating that they are prepared to meet their men as far as possible on the question of holidays and hours by granting six days' holidays with pay to motormen and conductors who have been in the service for six months, and reducing the longest turns and the spread-over as far as is reasonably possible. An offer to arbitrate on the claims of the Stalybridge Joint Tramways Board's employees has been rejected by the latter in favour of a ballot on the question of a strike. Bradford Tramways Committee effected a speedy settlement of the requests made to them, and two or three of the smaller municipal undertakings have given terms which represent the limit which their finances will bear, such as an increase of a farthing an hour and the extension to spare hands of the week's holiday with pay. The Manchester men have for some time had under consideration proposals for the improvement of their conditions of service, which cannot be excelled anyhwere in the kingdom. A position of some difficulty has been created for the Manchester Tramways Committee by the recommendation of the Workmen's Committee of the Corporation that all men employed in the engineering and allied trades be engaged at the standard rate of wages recognised by the associations of employers and the local organised bodies of workers in such trades in the district. The Corporation adopted this proposal, although the Tramways Committee had asked for its excision owing to the difficulty of securing the right kind of skilled men. As an example of ingratitude it would be difficult to surpass the attitude of the Sheffield union men. Their application was for time and a half to all employees for Sunday work, and the Tramways Committee decided that it should be granted at a cost of £1,254 per annum to motormen and conductors with over five years' service, and that the shilling per week merit pay at present given to car cleaners of ten years' approved service should be extended at a cost of £85 per annum to night shed men, brake-fitters, trolley examiners, overhaul fitters, etc., of ten years' approved service. In return the unionists have asked for an immediate response to the terms of their application, and they threaten to take steps to at once enforce the demand. Yet at a meeting of the Sheffield Federated Trades Council, the tramway union secretary admitted that the men had always been received courteously, that they had never come away empty handed, and that during the last nine years the union had gained nearly £15,000 for the employees. These observations were advanced in support of a resolution passed by the Trades Council embodying an impudent demand for the elimination of non-unionists from all Corporation departments, and for officials to give preference to trades unionists when engaging workmen. We may safely assume that the men will not be in a hurry to incur public disfavour by striking because they have been offered an increase of £1,254 in wages. Thanks to the spirited action of the directors of the Edinburgh Company, the tramwaymen of that city are not likely to find much support if they persist in their threat (made without the sanction of their union) to cease work this week unless the company concede a rise of a halfpenny to all employees. The men work 54 hours per week, and the directors first offered an increase of a farthing an hour to drivers and conductors. Immediately the directors received the strike threat on Tuesday last the manager issued two forms to each man, either of which had to be filled up and returned before midnight, the cars being stopped at 10 P.M. to enable the men to send in the forms. One embodied acceptance of the directors' terms and a declaration against striking, the other being a refusal and a statement of intention to strike. If more than half sign in favour of a strike the whole of the car hands and the engineers and general staff will be paid off this (Saturday) evening, and the works will not be reopened until a sufficient number of men have been trained to maintain the services. An intimation has also been given that under no circumstances will any strikers be reinstated. As the men's pickets outside of the office reported that only thirteen men had returned forms, a struggle seems inevitable. As the result of a further conference with a deputation in order to consider points which had been left in abeyance until the arrival of the chairman of the company in Edinburgh, the directors on Thursday announced as their final decision that they had agreed to ¼d. per hour also being given to the ten years' proved service conductors, and that the pointsmen would be placed on the same basis as the conductors and drivers by being paid time and a half for Sunday work.

---

**Railless Traction Bills.**—The Committee of the House of Lords, of which Lord Ribblesdale is chairman, on July 14 reported for third reading the Bill which had already passed the House of Commons authorising the installation of a system of railless trolley cars in Wood Green, Tottenham, and Walthamstow.—On July 14 Lord Newton's Committee of the House of Lords allowed the Mexborough and Swinton Railless Traction Bill to proceed, on condition that the canal bridge shall be subject to the same protection as the various local authorities, as given in the case of the Doncaster Rural Council.

Digitized by Google

## STREET TRAFFIC IN GLASGOW AND LEEDS.

The Select Committee of the House of Commons inquiring into the cause of accidents from motor traffic in London this week went further afield in their investigation and heard evidence on Wednesday from Mr. L. Mackinnon, traffic superintendent of Glasgow Corporation tramways, and on Thursday from Sir Robert Fox, town clerk of Leeds.

Mr. Mackinnon said that the traffic problem was a very pressing one in Glasgow. The cause of the congestion was the bringing in of all the cars to the centre of the city. The river divided the city into two sections—north and south—but west of Jamaica Bridge there was no bridge for taking the traffic across. As showing the developments of the tramway system—in 1894, when the Corporation started the tramways, they had 240 cars. At the present time they had 853, of which on busy days about 800 were in regular service. With regard to provision against accidents, each car was fitted with life-guard both in front and at the sides. That system was found perfectly satisfactory. In 1911 193 persons were lifted by the guard. On six occasions the life-guard failed to lift the body, and in four of these cases the body was pushed to the side. In 1912 the life-guard was in operation 171 times. In three cases it failed to lift the body, which, however, was pushed aside in each case. In 1913 the guard was in action 172 times. It failed on three occasions, and each time the body got under the car. These figures related to the front guard. He had no particulars relating to the working of the side guard. In 1911 out of 237,000,000 passengers carried over a mileage of 21,704,000 there were only 10 fatal accidents; in 1912, out of 275,000,000 passengers on a mileage of 22,435,000, only seven; and in 1913, out of 311,480,000 passengers on a mileage of 23,335,000, only 14. At present 4,650 cars crossed Jamaica Bridge daily, which made that bridge a very great centre of congestion. With a view to relieving that congestion it had been decided to build a new bridge west of Jamaica Street near Oswald Street. The Tramways Committee had also decided to reconstruct the Suspension Bridge and make it suitable for vehicular traffic. The Tramways Department would pay the cost of both bridges. Discussing the general treatment of congestion, Mr. Mackinnon said that at 47 points the traffic was regulated by the police and at eight of these places two constables were on duty at the same time. There were also 40 timekeepers of the tramways department, who regulated the traffic at the principal junctions. The ticket and traffic inspectors, numbering 50, also devoted attention to these matters. The central streets in the city were very narrow, the width varying from 27ft. to 46ft. or 50ft. The average width of the streets on which the tramways ran was under 40ft. Each car was fitted with three brakes. In a series of recent tests he had found that a car travelling at 12 miles an hour could be pulled up in its own length—30ft. At 14 miles an hour it could be pulled up in 45ft., and at 16 miles in 50ft. These results were obtained by using the ordinary service brake. With the emergency brake the cars could be brought to a standstill in a much shorter distance. The congestion of street traffic did not lead to loss of life, but it led to loss of time.

In regard to motor omnibuses, he thought their absence from Glasgow tended to safety. He did not think omnibuses could live in Glasgow in competition with the tramways at the low fares. He did not think Glasgow had a large number of accidents in comparison with other cities, but one reason why there were so many was that there were no open spaces in the centre of the city in which children could play. The city thoroughfares were the only playgrounds they had. Analysing the list of fatal accidents, he found that in 1911 60 per cent. represented children, in 1912 57 per cent., and in 1913 50 per cent.

As to tramway extension, application was about to be made for powers to construct 15 miles of tramways. It had never been suggested that the Corporation should run motor omnibuses in the city except as an experiment in the way of an all-night service, but that had never been done. He regarded a tramcar running on fixed rails as the safest vehicle they could have on the streets.

Sir Robert Fox in his evidence stated that Leeds Corporation besides owning and working the tramways also ran omnibuses in connection outside the city area. There had been no fatal accidents caused by omnibuses. The maximum number of fatal accidents caused by tramcars in the last ten years was six, and from other mechanically-propelled vehicles, such as motor cars and cycles, the maximum number of fatal accidents was 10 in 1911. During the last three or four years there had been a progressive increase in the number of non-fatal accidents from tramcars as new routes had been opened and more cars had been put on. The number of non-fatal accidents from other mechanically-propelled vehicles had increased threefold in the last four years, and had risen from 33 in 1907 to 108 in 1910, 142 in 1911, and 184 in 1912. As a precautionary measure a larger number of police had been put on point duty, but they had come to the conclusion that their powers were not sufficient, especially in dealing with intermittent traffic. The drivers of motor cars were bound by law to stop when called on by the police to do so, and he failed to see why other traffic should not be subject to a similar law. What was required was a statutory provision of general application.

---

**Proposed Revision of Stopping Places.**—On the recommendation of the manager, the Brighton Tramways Committee advised the Council to apply to the Board of Trade to change several compulsory stops to optional stops, several being on descending journeys. The Council, however, referred the report back for further consideration.

## CROYDON AND OMNIBUS COMPETITION.

PROBABILITY OF RATE-AID NEXT YEAR—REQUEST FOR LEGISLATION.

Mr. T. B. Goodyer, manager of the Croydon Corporation tramways, has forwarded to over 70 members of Parliament representing constituencies in and adjacent to the Metropolitan area, and also to the members of the Parliamentary Labour Party, copies of the resolution unanimously passed by the Croydon Corporation, urging the Government to pass such legislation as will place motor omnibus companies on terms of equality with regard to public obligations with the Municipal Tramways Authorities. The letter also states:—

"The Municipal Tramways Authorities in the area named have expended, practically, 13½ millions of pounds on their undertakings, and when I tell you that, next year, there is every probability that each undertaking will require aid from the rates—instead of being self-supporting, as hitherto—you will, I trust, readily see how very serious the present outlook is for those ratepayers in the Metropolitan area whose tramways are municipally owned. The Metropolitan tramways managers desire, not that their undertakings shall have any preferential treatment, but that motor omnibus operators should be placed on terms of equality with regard to the public burdens now borne by the tramways in the area named. May I express the hope that it will be possible—in the interests of the ratepayers concerned—for you, and the party you represent, to co-operate with other Parliamentary representatives in urging the Government to pass such legislation as will prevent the already over-taxed ratepayer from being further burdened."

Enclosed with the letter was the following extract from Mr. Goodyer's report on the Croydon tramways for the year ended March 31, 1913:—

COMPARISON OF PUBLIC BURDENS BORNE BY TRAMCARS AND MOTOR OMNIBUSES IN CROYDON.

| Items. | Car. £ s. d. | Omnibus. £ s. d. |
|---|---|---|
| License Duties .. .. .. .. | 2 15 0 .. | 5 18 0 |
| Rates on Track .. .. .. | 43 8 9 .. | — |
| Maintenance of Road .. .. .. | 92 11 9 .. | — |
| Petrol Tax .. .. .. .. | — .. | 43 0 0 |
| Total .. .. .. | £138 15 6 .. | £48 18 0 |

In addition to the above payments, the Croydon cars for the past year have contributed £3,000 towards the rates, or an average per car of £51 14s. 6d., thus making the sum of £100 10s. per car run, or a gross total of £11,005 16s. 7d. as a contribution to the local revenue, while the contribution of the 'buses is *nil*.

ADDITIONAL NOTES RELATING TO LOCAL EXPENDITURE BY CROYDON CARS FOR YEAR ENDED MARCH 31, 1913.

The amount paid in wages was £32,264,* or 35.63 per cent. of the revenue earned (£90,543).

Out of every 20s. earned 7s. 1½d. has been spent in wages.

No doubt the greater part of this sum would be expended locally in house rent, tradespeople, etc.

The permanent way expenses and the rates and taxes represent respectively 5.93 per cent. and 2.61 per cent. of the revenue earned.

HOW TRAMCARS IN THE METROPOLITAN AREA ARE HANDICAPPED IN COMPARISON WITH THE OMNIBUSES.

| | Tramcars. | Omnibuses. |
|---|---|---|
| Control | Only permitted to run on routes sanctioned by Parliament. | Free to go anywhere at their option. |
| Track. | Provided and maintained by the system. Damage done by motor 'buses and other traffic repaired at cost of trams. | Provided and maintained by the rates. Repairs paid for by the general ratepayer. |
| Workpeople's Fares. | On all routes. | None. |
| Rates on Track. | Pays rates on track. | None. |

It will be observed from the foregoing that omnibuses operate under conditions of unmatched freedom from every point of view. A tramway, which is a statutory undertaking, constructed under conditions necessitating a heavy capital expenditure—afterwards, burdened by yearly charges, and having to comply with the Board of Trade conditions—is heavily handicapped in having to compete with another system, contributing largely towards the wear and tear of the various roads in the borough over which it runs, but making no payment *whatever* towards the maintenance of such roads, or local burdens. Tramways, also, are under statutory obligations to provide exceptionally cheap fares for their workpeople's services, thereby benefiting employers as well as employees. The provision of such facilities, in all cases, may be said to result in a serious loss. The motor omnibus has no obligation to give similar facilities—yet which are requisite—has no legal liabilities in connection with road maintenance, and is subject to no rates other than those for buildings and garages which are occupied. Those who use the roads for the benefit of shareholders should pay for the upkeep of those roads. Tramways pay more than their fair share of the cost of road maintenance by reason of the obligation that rests upon them to make good and

*Including the wages paid to permanent way men in roads department.

Digitized by Google

maintain the permanent way, which they only technically "use," and the width of the paving each side of the track. In addition, they are also called upon to pay the equivalent of a rent for the use of the roads in the shape of a substantial contribution for rating.

Legislation, therefore, in the interests of the ratepayers and those Municipal Authorities in the Metropolitan area who have invested 13½ millions of pounds in their tramway undertakings—is very urgently required, so that services provided by the community, at the cost of the community and in the interests of the community, should not be in a *less* favourable position than other competitive means of transport. Fortunately, valuable precedents in respect of contributions towards road maintenance by the operation of motor omnibuses and trackless trolley vehicles, have already been established in the following instances. Mr. Goodyer here cites the Chesterfield Corporation's Motor Omnibus and Trackless Trolley Bill and the Rhondda Tramways Company's Trackless Trolley Bill dealt with in May last. In the first case a House of Commons Committee required a clause to be inserted in the Bill in order to render the Corporation "liable for damage arising out of the extraordinary traffic proposed by the Bill, such damage to be assessed, at the end of three years, by arbitration." In the Rhondda Bill a clause was inserted requiring the promoters "to pay a fixed sum per car mile towards the maintenance of the roads upon which such vehicles shall be run."

The question of principle having at last been determined, as in the cases mentioned, the matter should, obviously, Mr. Goodyer states, be carried a step further and applied to the Metropolitan area where the local authorities have no control over the licensing of public vehicles.

## L.C.C. TRAMWAY MATTERS.

IMPROVEMENT IN RECEIPTS.

The usual statement of the tramway traffic receipts presented by the Highways Committee at last Tuesday's meeting of the London County Council showed a welcome change as compared with the decreases exhibited owing to motor omnibus competition for some time past. The total traffic receipts for the week ended July 2 were £43,445, as compared with £43,479 for the week ended July 3, 1912. The decrease was thus only nominal. The number of passengers carried showed a marked increase, the total being 10,263,626 as compared with 10,253,039 in the corresponding week. The length of route open was 143.04 miles against 140.57 miles. Out of the total 6.91 miles were worked by horse against 10.31 miles in the previous year. The electric lines alone showed an appreciable increase both in traffic receipts and in passengers. The total decrease in traffic receipts from April 1 to July 2 of the present year was £20,203.

CARS FOR SPECIAL PURPOSES.

The Highways Committee reported that the Board of Trade had now made the amended by-laws requested by the Council relating to the use of tramcars for special purposes.

COST OF PROMOTION OF BILLS.

A statement was submitted, as given below, showing the cost of promoting London County Council (Tramways and Improvements) Bills during the session of Parliament from 1904 to 1912 together with the length of the lines proposed and the mileage authorised by Parliament.

| Session. | Cost of promotion. £ | Mileage in Bill as deposited. | Mileage authorised. |
|---|---|---|---|
| 1904 ... ... ... | 5,118 | 25⅝ | 11½ |
| 1905 ... ... ... | 2,123 | 2½ | Rejected |
| 1906 ... ... ... | 5,463 | 16½ | 6¾ |
| 1907 ... ... ... | 2,702 | 5½ | ⅝ |
| 1908 ... ... ... | 1,532 | 4¼ | 2¾ |
| 1909 ... ... ... | 4,301 | 10¼ | 3⅝ |
| 1910 ... ... ... | 4,116 | 15 | 2¾ |
| 1911 ... ... ... | 3,686 | 14¾ | 1⅝ |
| 1912 ... ... ... | 3,253 | 5⅝ | 1⅛ |

The mileage given is for new tramways only, and does not include schemes for the reconstruction of existing lines for electric traction. The Bills also include many miscellaneous proposals relating to the tramway undertaking.

A TRAMWAY "LAY-BY."

The Highways Committee had conferred further with the representatives of the Camberwell Borough Council on the question of constructing a tramway "lay-by" in the Harders Road, Peckham, in order to relieve the congestion of traffic near Rye Lane. As a result it had been agreed that the "lay-by" should be installed. No property would have to be acquired, and the cost of installing the "lay-by" was estimated at £2,250.

All tramway reports were adopted.

In the course of a discussion on the cost of promoting tramway Bills from 1904 to 1912,

Sir JOHN BENN said that from 1904 to 1906 18 miles were added to the system at a cost of £706 per mile for Parliamentary expenses, whereas from 1907 to 1912 13 miles had been added at a cost of £1,500 a mile.

Mr. CYRIL JACKSON pointed out that in the latter period the most difficult routes had to be dealt with, and the Government had not attempted to remove the local veto. This year there would be a reduction of expenses as the Council were not promoting hopeless extensions.

## PRIVATE BILL LEGISLATION.

A QUESTION OF COMPULSORY RUNNING POWERS.—In the House of Commons on Monday the decision of a Select Committee on the London County Council Tramways Bill was reviewed. One of the proposals in the Bill was that the Council should be empowered to work when they acquire it from the London United Tramways Company a short cross-connecting length of tramway in the western suburbs. The Council already have power to work the parts of the main lines of the company which are in London as soon as the purchase has been completed. The Committee on the Bill granted the power to work the cross-line, but against the wish of the promoters inserted clauses giving the company compulsory running powers over the main lines in London which terminate at Hammersmith and Shepherd's Bush, their idea being to make certain that there should be through communication between the purchased lines in London and the western part of the lines outside which remain in the hands of the company. The Council took up the position that they would doubtless make voluntary arrangements for mutual through running as they have already done with other outside lines, but they objected on principle to the company being given compulsory running powers. SIR E. Cornwall (N.E. Bethnal Green—L.) now moved the deletion of the clauses giving these powers, and after some discussion the proposal to delete the clause was agreed to and the Bill was read a third time.

## NEW AND PROSPECTIVE WORK.

BELFAST.—The Corporation have decided to apply to the Local Government Board for sanction to a loan of £35,000 for the extension of the electricity undertaking.

CARDIFF.—On the recommendation of Mr. A. Ellis, the electrical engineer and tramways manager, the Finance Committee have advised the Corporation to borrow £30,000 for the purpose of purchasing new plant and machinery at the power station.

WEST HARTLEPOOL.—A plan for an extension to the tramway car shed has been adopted, and the manager has drawn up a memorandum for the approval of Mr. J. F. C. Snell, the consulting engineer, of suggested alterations and renewal of plant. On July 2 the Council approved of the suggested alterations to the car shed, the purchase of four new cars, and a rail-grinding equipment. On the preceding day a Local Government Board inquiry was held into an application to borrow £4,300 for the purchase of new plant for the electricity works in connection with the supply of current to the tramways.

## MISCELLANEOUS NEWS AND NOTES.

**The Tramways and Light Railways Association.**—The "Official Journal" for July contains a report of the discussions at the Congress at Blackpool, and the list of applications for light railway orders.

**Conveyance of Postmen.**—Contracts have been made with the Postmaster-General for the conveyance of postmen on the tramcars in Coventry and Southampton. In the former city the payment is £200 per annum, and the contract is for five years.

**Traffic Inducement at Lowestoft.**—The Town Council have confirmed the action of the Parks Committee in granting an application by the tramways manager for permission to place a band at Belle Vue Park and Kirkley Recreation Ground on alternate Sunday afternoons during the summer.

**Pressure on American Rail Manufacturers.**—Owing to the makers of inter-sections being unable to promise delivery under sixty (in one case ninety) days, Mr. E. A. Robert, president of the Montreal Tramways Company, has informed the City Council that there will be some delay in opening certain of the sixteen new car routes which are to be constructed.

**Brighton Tourist Cars.**—As many visitors do not care to pay a shilling to go round in a tourist car, it has been decided to issue visitors' tickets for a journey round the Beaconsfield Ditchling circular route, and, in addition, to either the Dyke Road terminus or the Race Hill, or Queen's Park terminus and back, at a combined charge of sixpence.

**London United and Middlesex Tramways to be Joined Up.**—Acton Council have referred to the Highways Committee a letter received from the Middlesex County Council conveying a proposal to link up the Council's tramways with those of the London United Electric Company. The former now terminate at the end of Horn Lane, and the latter passing the Market Place a few yards away.

**Season Tickets.**—Maidstone Council have agreed to the issue of season tickets on the tramways from the Cannon, High Street, to the "Swan" at Loose at £3 3s. per annum, £1 12s. 6d. per half-year, and 17s. 6d. a quarter. Councillor Lyle, chairman of the Tramways Committee, expressed the opinion that the tickets would prove a great convenience to the public, as well as a considerable source of revenue.

**Improved Conditions for Bradford Tramwaymen.**—The Tramways Committee on July 7 granted an advance of 2s. a week to inspectors, with a maximum wage of 45s. a week. The wages of the parcelmen are to vary according to their duties. For the conductors, who number some 300, the following scale was asked for:—5¾d. per hour on appointment, 6d. after six months' service, 6¼d. after twelve months, 6½d. after eighteen months, 6¾d. after three years, and 7d. after five years. These demands have been granted, with certain minor alterations affecting the time at which the maximum comes into operation.

Digitized by Google

**Middlesex County Council Tramways.**—The annual report of the Light Railways Committee, recently presented to the Middlesex County Council, stated that the car mileage last year amounted to 11,483,870, and the traffic receipts to £461,043, an earning of 9.65d. per mile. Although the mileage had increased by one million, the receipts had only increased by £1,500. The earnings in previous years had always been upwards of 10d. or 11d. a mile. The capital expenditure on the undertaking amounts to £1,796,083. An agreement is in course of preparation for through running between Finchley and Holborn (*viâ* Wood Green and Caledonian Road), Waltham Cross and Smithfield, Muswell Hill and Bloomsbury, and New Southgate and Aldersgate Street (*viâ* Green Lanes and Essex Road).

**Progress of Nottingham-Ripley Tramways Construction.**—Before the end of July it is expected that the Heanor-Cinderhill portion of the tramways in course of construction from Nottingham to Ripley will be opened for traffic. The total length of the line is fourteen miles, and in laying it five railway bridges have been widened or rebuilt. Widenings have been effected at 75 places, but Mr. W. H. B. Wright, the engineer to Messrs. Balfour, Beattie and Co., states that no great difficulties have had to be encountered. The work has been in progress about thirteen weeks, and the line passes through Kimberley, Giltbrook, Hilltop, Eastwood, Langley Mill, Heanor, Codnor, Loscoe, and Ripley. The main generating station is at Ilkeston, and there are eight sub-stations. Nottingham Tramways Committee have agreed to link the Cinderhill section with their tramways at Basford, and there will be through running.

**Damages Against Llanelly Traction Company.**—In an action heard at Llanelly County Court the Traction Company were sued for £100 damages in respect of injuries sustained during an assault alleged to have been committed by the company's employees. Wm. Griffiths, the plaintiff, gave evidence that he boarded a car near the Post Office. The conductor said, "Go down and wait for another car." It was raining heavily at the time, and he refused to alight. The conductor was alleged to have then caught him by the throat and struck him, knocking out a tooth. When the car stopped the motorman in pulling him off the car wrenched plaintiff's arm, and as a result he had been unable to follow his employment since March 1. Three passengers gave evidence for the plaintiff. The conductor denied plaintiff's version, and said the man struck him after having boarded the car while in motion against witness's instructions. The motorman, a passenger, and Mr. C. Tattam, the tramways superintendent, also gave evidence. The jury brought in a verdict for plaintiff, and assessed the damages at £50.

**Assessment on Net Income or on Car Mileage?**—Stoke Newington Council have decided to assess the London County Council tramways in that borough not upon the net income of the undertaking but upon car mileage, of which that in Stoke Newington was approximately a fifty-fifth part. Of the total estimate of a quarter of a million, Stoke Newington claims an amount of £5,545 for which they should receive rates. This is an increase from £3,200, which was the assessment before the electrification of the Green Lanes track. The County Council have asked to be placed in a provisional list for the purpose of reducing the present assessment.

**Stalybridge Joint Tramways Board's Problems.**—Mossley Council at their July meeting agreed to pay the sum of £2,281 as their share of the loss of £9,124 which had resulted on the past year's working of the Stalybridge, Hyde, Mossley and Dukinfield Joint Tramways and Electricity Board. Alderman Clark, chairman of the Tramways Committee of the Board, said the loss was due to unforeseen circumstances. Referring to complaints as to the cars causing passengers to miss trains, he observed that on a small system, and with single lines, they could not run cars as regularly as on one with double lines. Cars could not be run to meet trains. After the last accident the shed at Mossley was closed on the recommendation of the Government inspector. It was better for the cars all to be at one shed, where they could be properly inspected before turning out. The Mayor said the bad year was chiefly caused by the tramwaymen's strike, the coal strike, the cost of coal, and the breakdown of plant. Their great difficulty was that the cars were only earning 8d. per mile when they should be earning 10d., and the problem was how to get the other 2d. The electricity department was doing fairly well, and would, he hoped, be able to give a helping hand next year.

## CONTRACTS AND ORDERS.

**Siemens Bros.' Dynamo Works** are supplying Tantalum traction lamps to Rochdale tramways.

**Edgar Allen and Co.** have received a contract for the supply of points and crossings to Southend Council.

**United Electric Car Company** have obtained the contract for supplying fourteen top covers to Burnley tramways.

**West Ham Council** have accepted the tender of J. Baker and Co., of Rotherham, for supplying 32in. steel tyres to the tramways department.

**The Albion Motor Car Company, Limited,** Scotstoun, have recently received orders for two 30-cwt. Albion motor cars for Christchurch Tramways Board.

**The Daimler Company, Limited,** have obtained a contract for the supply of spares and other accessories required for three motor omnibuses, to Rotherham tramways department, at £432.

**Carlisle Council** have placed a contract with Pratchitt Bros. for the supply and erection of a coal conveyor and bunker at £1,055, and with Babcock and Wilcox, Limited, for steam and water pipes at £395.

**Siemens Bros. Dynamo Works** have been awarded a contract for the annual supply of Wotan lamps for office lighting and of Tantalum lamps for car lighting to South Shields tramways.

**Regina, Canada.**—The City Commissioners of Regina, Saskatchewan, have just ordered from Bruce, Peebles and Company, Limited, through that firm's Eastern Canadian agents, a 1,200 k.w. motor converter (Peebles la Cour patents).

**C. and J. Webb and Co., Limited,** have received a contract from Yarmouth Council to supply tramwaymen's overcoats at the following prices:—For motormen, 24s. 10d. each; conductors, 23s. 7d.; inspectors, 36s. 9d.; chief inspector, 38s. 3d.

**Newport Council** have accepted the following tenders:—Switchgear (with British Thomson-Houston switches), Bertram Thomas; 100 tons of tramway rails at £7 15s. per ton, Walter Scott, Limited; rewinding turbo-alternator, General Electric Company.

**Walsall Council** have accepted the tender of the Harris Patent Feed Water Filter (1910), for a water softener for £345, and of Normans, Limited, for erecting a new steel and iron building for the additional boiler house at the electricity station for £397.

## PERSONAL.

**Mr. H. King,** late traffic superintendent of the Merthyr Electric Traction Company, has been presented with a testimonial recording the esteem in which he is held by the staff and employees. Mr. King has been appointed tramways manager at Aberdare.

**Mr. Francis Husband** has resigned his position with the London County Council tramways to take up the position of engineer and director with the Electrical Contracts and Maintenance Company, Limited, Sanctuary House, Westminster, S.W., as from July 1.

**Mr. G. Webster,** who has been the Rochdale Corporation tramways traffic superintendent for the last ten years, has been recommended by the Tramways Committee for appointment as general manager, in succession to Mr. J. S. D. Moffet, now manager of the West Ham tramways.

**Mr. Arthur Ellis,** the general manager and electrical engineer, and the staff of Cardiff tramways were heartily praised for their work during the past year by Sir John Courtis, the chairman of the Tramways Committee, when proposing the adoption of the annual report on the working of the tramways.

**Mr. F. Buckley,** general manager of Wigan Corporation tramways, was referred to in terms of warm praise by the employees at their annual outing, for his efforts to bring about a satisfactory solution of the question of improved conditions of employment. A resolution was passed thanking the Tramways Committee for their favourable response to the men's application.

**Mr. J. Dalrymple,** general manager Glasgow Corporation tramways, has been authorised to visit the most important cities in America where tramways are in operation, with a view to making himself acquainted with the most modern and up-to-date method of tramway traction. In view of the proposal to construct a new bridge over the Clyde, the Master of Works is to visit places in America where different types of opening bridges may be seen.

**Aldermen J. Clark, J.P., and R. Wood,** the chairmen of the Tramways and Electricity Committees of the Stalybridge and District Joint Tramways Board, were referred to in terms of commendation at a meeting of the Mossley Council, Councillor Sykes remarking that the members of the Joint Board were proud of the two chairmen. Expressing a hope for a more successful future for the undertaking, he said they had made application to borrow a sum of £25,000. An inspector held an inquiry, and many inquiries were made as to the management and general position. The opposition had been left without a leg to stand on. If they had had a better lead at the start and more expert advice they would have saved thousands of pounds. Another member bore testimony to the ability and diligence of Messrs. Schofield and Blackmore, the chief officers.

## FINANCIAL REPORTS AND MEETINGS.

**Torquay Tramways Successful Working.**—For the first half of the year the traffic returns of the Torquay Tramways Company show an advance of £1,200 over the corresponding period last year.

**The British Electric Traction Company.**—The receipts of all the associated companies of the British Electric Traction Company for the week ended July 11 amounted to £50,686. Upon such of the lines as were working both last year and this year the receipts show an increase of £558 upon the week.

**London Electric Railway Dividends.**—For the past half-year: Metropolitan District, at the rate of 2½ per cent. per annum on the 5 per cent. second preference stock; London Electric Railway, at the rate of 1 per cent. per annum on the ordinary stock; Central London, at the rate of 3 per cent. per annum on undivided ordinary stocks, and at the rate of 4 per cent. per annum on the preferred ordinary stock; City and South London, at the rate of ¼ per cent. per annum on the ordinary stock; Underground Electric Railways, full distribution on the income bonds at the rate of 6 per cent. per annum.

**Electric Construction Company.**—At the annual meeting of the Electric Construction Company in London on July 15, Mr. P. E. Beecheroft, who presided, said the net profit had increased from £20,304 to £27,500. Their works had been fully employed, and better prices had prevailed. They had been able to handle an increased output at comparatively little additional cost in the way of fixed factory charges. It was proposed to pay a dividend of 5 per cent. on the ordinary shares, and transfer £10,600 to the reserve, leaving to be carried forward £6,899. The report was adopted.

**Argentine Railway Feeders.**—Some time ago the Minister of Public Works of the Province of Buenos Ayres submitted to the Legislature a project which authorised the issue of a loan for $3,500,000 gold for the installation of portable railways of 50 centimetre gauge to be constructed in the highways in various parts of the province and act as feeders to the network of main lines. Messrs. Muller and Passman applied to the Government for permission to construct 300 kilometres of line of this system at a cost of $4,800 a kilometre. The department of engineers reported favourably on the project, but the department of highways were against it. The Minister of Public Works will shortly grant the concession asked for.

**The Purchase of Perth Electric Tramways, Limited.**—At an extraordinary meeting of the Perth Electric Tramways, Limited, Mr. O. Wethered presiding, the shareholders passed a resolution winding up voluntarily, to enable the directors to carry out the sale of the property to the Government. The chairman said there would be no difficulty in at once making a distribution, probably £1 per share, the distribution of the balance of the assets following as soon as the necessary details of the liquidation are carried out. Mr. Stoneham, who seconded, said that the Government had made a good bargain, and as they had raised the loan at a little over 4 per cent., if they carried on the tramway as the company had carried it on, they would no doubt be receiving something like 10 per cent. upon their money.

**General Electric Company.**—Presiding at the annual meeting of the General Electric Company in London on July 10, Mr. H. Hirst said that the net trading profits and income from investments for the past year amounted to £145,260, against £133,507 for 1911-12, to which must be added the balance brought forward, which gave them a total of £177,311 to be dealt with, against £145,777. They proposed to pay this year 10 per cent. on their ordinary shares, against 7½ per cent. last year. Certain of their manufacturing departments, producing specialities, had been turned, for purposes of policy, into separate companies, so that they could take as partners experts in specific lines. Their investments under that heading amounted to about £100,000. There was an ever increasing demand for electrical power for use in small and big industries; they were on the threshold of a big development in electrical heating and cooking, and the electrification of railways was coming fast.

**Croydon Corporation Tramways.**—The report of the general manager, Mr. T. B. Goodyer, to the Tramways Committee, shows that the total receipts for the year ended March 31 amounted to £92,463, and the working expenses to £66,218. Including bank interest there is a gross balance of £27,153, a decrease as compared with the previous year of £6,434. After providing for interest on capital, £7,993; contribution to sinking fund, £7,428; and income-tax, £1,145; there is a net balance of £10,586 (a decrease of £6,717). Of this sum £3,000 has been paid in aid of rates, and £7,586 has been transferred to the renewals fund. The gross balance is equal to 0.53 per cent. on the capital outlay, and the net balance to 3.72 per cent. The percentage of expenses to total revenue is 70.01. Unfavourable weather and motor omnibus competition, increased rates, increased power costs, due to the additional mileage, increased cost of permanent way repairs, etc., are mentioned in explanation of the decrease in the net results. The total receipts per car mile were 8.46d., a decrease of .85d. as compared with the previous year. The average profit per passenger has decreased from .168d. in 1912 to .087d. in 1913. The consumption of electrical energy was 2,484,093 units, an average of .938 unit per car mile, the cost being 1.505d. per car mile (a reduction of .040d.), while the average cost per unit is 1.604d. Mr. Goodyer's remarks on motor omnibus competition are given elsewhere in this issue.

## WEEKLY TRAFFIC RETURNS.

The official traffic returns of 67 of the principal undertakings of the United Kingdom for the week ended July 12 amounted to £259,103, or £6,051 more than in the corresponding week last year, while the track mileage was 2,712, or 52 more than for the corresponding week. The receipts were at the rate of £95 10s. 9d. per track mile, an increase of 14s. 11d. per mile as compared with last year.

# WEEKLY LIST OF TENDERS INVITED.

### BOURNEMOUTH CORPORATION TRAMWAYS.

The Tramways Committee of the County Borough of Bournemouth are prepared to receive tenders not later than August 27, 1913, for :—

Reconstruction of Permanent Way (equal to about 3 miles single track).

Specifications, quantities, and forms of tender may be obtained on application to the undersigned on payment of a deposit of £2, which will not be returned except on receipt of a *bonâ-fide* tender.

Additional copies may be had on payment of £1 1s. each, which will not be returned.

The Committee do not bind themselves to accept the lowest or any tender.

I. BULFIN, B.A., A.M.I.C.E., M.I.M.E., M.I.E.E.,
General Manager.

Tramways Offices, Bournemouth.

### COUNTY BOROUGH OF WARRINGTON.

ELECTRICITY DEPARTMENT.

The Electricity and Tramways Committee of the County Borough of Warrington invite tenders for E.H.T. Feeder Panel.

Specification and form of tender can be obtained from the undersigned on payment of one guinea, which will be returned on receipt of a *bonâ-fide* tender. Five shillings each will be charged for extra copies of specification.

Tenders, addressed to the Chairman of the Electricity and Tramways Committee, Town Hall, Warrington, must be sealed with wax and endorsed "Tender for E.H.T. Feeder Panel," and delivered not later than 12 o'clock noon on Wednesday, August 6.

The lowest or any tender will not necessarily be accepted.

F. V. L. MATHIAS,
Borough Electrical and Tramways Engineer.

Howley, Warrington.

### COUNTY BOROUGH OF WARRINGTON.

ELECTRICITY DEPARTMENT.

The Electricity and Tramways Committee of the County Borough of Warrington invite tenders for twelve months' supply of Earthenware Conduit.

Specification and form of tender can be obtained from the undersigned on payment of one guinea, which will be returned on receipt of a *bonâ-fide* tender. Five shillings each will be charged for extra copies of specification.

Tenders, addressed to the Chairman of the Electricity and Tramways Committee, Town Hall, Warrington, must be sealed with wax and endorsed "Tender for Earthenware Conduit," and delivered not later than 12 o'clock noon on Wednesday, August 6, 1913.

The lowest or any tender will not necessarily be accepted.

F. V. L. MATHIAS,
Borough Electrical and Tramways Engineer.

Howley, Warrington.

### EAST INDIAN RAILWAY.

The East Indian Railway Company is prepared to receive tenders for the supply and delivery of :—

Wheels and Axles,

as per specification to be seen at the Company's Offices.

Tenders to be sent to the undersigned, marked "Tender for Wheels and Axles," not later than 11 o'clock a.m. on Wednesday, the 6th day of August proximo.

The Company reserves to itself the right to divide the order, also to decline any tender without assigning a reason, and does not bind itself to accept the lowest or any tender

For each specification a fee of £1 1s. is charged, which cannot under any circumstances be returned.

By order, C. W. YOUNG,
Secretary.

Nicholas Lane, London, E.C.,
July 24, 1913.

### PLYMOUTH.

The Plymouth Corporation is prepared to receive tenders for the undermentioned works in connection with the Electricity Works of the Borough, viz. :—

Contract No. 30.—Steam Turbo-Alternator, Condenser, etc.

Contractors may not tender for a part of any contract.

Copies of the conditions, specification, and form of tender, bound up together, may be obtained from the undersigned on the deposit of one guinea for each copy, which will be returned after receipt of a *bonâ-fide* tender upon the prescribed form, and within the stated time.

Should a contractor withdraw his tender, the amount of his deposit will be forfeited.

Sealed tenders, endorsed "Contract No. 30," must be delivered to the undersigned not later than August 27, 1913.

The Corporation does not bind itself to accept the lowest or any tender.

(Signed), E. G. OKELL,
Borough Electrical Engineer.

### MUNICIPAL COUNCIL OF SHANGHAI.

The Council invite tenders for the supply and delivery f.o.b. British Port of the following :—

CONTRACT NO. 1.

Two Steam Turbo-Alternators, each of 5,000 kw. capacity, complete with Surface Condensing Plant, etc.

CONTRACT NO. 2.

Four Water-Tube Boilers, Evaporating 28,000lbs. each, with Integral Superheaters, Mechanical Stokers, Economisers, etc.

Specifications, general conditions, and forms of tenders may be obtained from Messrs. Preece, Cardew and Snell, 8, Queen Anne's Gate, Westminster, S.W., on payment of a deposit of £2 for each contract, which will be refunded on receipt of a *bonâ-fide* tender.

Extra copies of each specification can be obtained on payment of 2s. 6d. each, non-returnable.

Sealed tenders, in duplicate, endorsed "Shanghai," are to be delivered to Messrs. Preece, Cardew and Snell, 8, Queen Anne's Gate, Westminster, S.W., before 12 o'clock noon on Tuesday, August 26, 1913.

The Council do not undertake to accept the lowest or any tender, and reserve the right to accept the whole or a portion of any tender.

### COUNTY BOROUGH OF BIRKENHEAD.

The Corporation of Birkenhead are prepared to receive quotations from parties desirous of tendering for special Tramway Trackwork in manganese cast steel, comprising points and crossings.

Particulars of the material required may be obtained on application to Mr. Chas. Brownridge, M.Inst.C.E., Borough Engineer and Surveyor, Town Hall, Birkenhead.

## LIVERPOOL CORPORATION TRAMWAYS.

ADVERTISING ON TRAMWAY CARS.

The Tramways and Electric Power and Lighting Committee are prepared to receive tenders for the exclusive right to Advertise upon the Tramway Cars for a period of seven years, commencing on the 1st August, 1914.

The number of cars, working and spare, excluding first-class cars, is 496, and the total length of line traversed 119 miles. The total mileage of the cars during 1912 amounted to 12,590,408, and the number of passengers to 134,249,967. The total resident population in the districts served by the Corporation tramway cars amounts to approximately 838,000.

Tenders must be enclosed in the envelope provided, and addressed to the "Town Clerk, Municipal Buildings, Liverpool," and forwarded through the post so as to be received by him not later than the first postal delivery on Wednesday, the 13th August, 1913.

Form of tender and specification may be obtained upon written application to C. W. Mallins, Esq., A.I.E.E., General Manager, Tramways Department, Central Offices, 24, Hatton Garden, Liverpool.

EDWARD R. PICKMERE.
Town Clerk.

Municipal Buildings, Liverpool,
July 21, 1913.

## FOR SALE.

THE OWNER OF BRITISH PATENTS, Nos. 21332 of 1906, 21333 of 1906, and 21334 of 1906, relating to "Improvements in the Manufacture of Forged Metal Car Wheels," is desirous of disposing of the patents or entering into working arrangements under license or otherwise with firms likely to be interested in the same.

Copies of the patent specifications, and full particulars can be obtained from and offers made (for transmission to the owner) to MARKS AND CLERK, 57 and 58, Lincoln's Inn Fields, London, W.C.

## THE HOUSE OF LORDS ON THE RATING QUESTION.

Tramway authorities all over the country will be keenly disappointed with the result of the appeal to the House of Lords in the case of the Tottenham Urban District Council *v.* the Metropolitan Electric Tramways, Limited. The question raised in this case, as our readers are well aware, was whether tramways should pay rates on their full net annual value, as they have had to do in the past, or whether they should for purposes of rating be considered to be railways, and therefore have the benefit of the Public Health Act, 1875, which provides, among many other things, that railways are only to pay rates on one-quarter of their full net annual value. The House of Lords, on Thursday, reversed the decision of the Court of Appeal, and restored the judgment of a Divisional Court deciding that tramways must continue to pay on the full net annual value. The judgment is briefly reported in our present issue, but it may be useful here to point out one or two surrounding features. Point was given to the case by the fact that a part of the lines worked by the tramway company in Tottenham consists of a light railway, authorised by a Light Railway Order, while another part is a tramway, authorised as such by a private Act. The light railway and the tramway in their construction, equipment and working are indistinguishable from one another, and the same cars run over both. The light railway has to pay rates on only one-fourth of its net annual value. This, of course, was settled once for all by the House of Lords in the Wakefield case in the year 1908, when it was decided, following out an express provision of the Light Railways Act, that a light railway is for all purposes, except that of passenger duty, to be deemed to be a railway, and that all enactments relating to railways shall apply. Thus the question became very pertinent whether this tramway, forming a continuation of the light railway, should not be assessed in the same way. Of course, if the answer had been in the affirmative, all tramways in England would be similarly relieved. The decision of the House of Lords shows once more the "glorious uncertainty of the law." The Divisional Court, evidently after hearing very little argument, affirmed the view of the local justices that the tramway was not a railway, reliance being placed on the old Swansea case of 1892. When the matter came before the Court of Appeal in February, 1912, Lord Justice Farwell, Lord Justice Kennedy, and Mr. Justice Warrington unanimously reversed that decision. They held that the tramway was a railway, and based themselves principally on the fact that in the words of the Public Health Act the subject which was being rated was "land used as a railway." This might seem incontrovertible; but now the House of Lords, in the persons of the Lord Chancellor, Lord Shaw, and Lord Moulton, unanimously affirm that a tramway is not a railway. They appear to waive consideration of the question whether the subject is land used as a railway, and to base themselves upon the distinction between a railway and a tramway, which they say is clearly understood both by the popular and the legal acceptation of the two terms. They also think that if a partial exemption from rates conferred by the Public Health Act was intended to extend to tramways, that Act would have made it clear in terms. In public legislation it is laid down that the word "railway" does not include "tramway," unless it is expressly made to do so by the terms of the Act. The decision comes just at a time when an agitation is growing for the relief of tramways from the special burdens placed upon them in the way of rates and liability for road maintenance, in order that they may be put in a position of greater equality with automobile passenger traffic. There is accordingly one special advantage in having the law declared at the present time, because those who are anxious to get fairer conditions for tramways have now a solid basis from which to work towards the much-needed and much-desired reform.

## ARBITRATION AT SHEFFIELD.

In response to a request from the union tramwaymen, the Sheffield Committee have reconsidered their refusal to grant time and a half for Sunday labour to motormen and conductors other than those with five years' service. Without any solicitation from the men, the Committee, however, have offered to refer the question in dispute to the arbitration of an independent person to be appointed by the Board of Trade. Thus the Committee have deprived them of any support for the proposal to take a ballot on the question of withdrawing labour, and if the national executive of the union desires their local committees to retain the confidence of municipal authorities generally they should direct the men to follow the precedent set in the case of Manchester a few years ago by submitting the matter to arbitration. At present the local committee have only decided to take the employees' opinion regarding arbitration. The lengthy review of the position of affairs which Mr. A. R. Fearnley forwarded to the secretary, in communicating their decision, leaves the men without a leg to stand upon. This is recognised by editorial writers of the Liberal and Conservative daily newspapers, the first-mentioned journal observing:—

"On broad principles our sympathies are with Labour in a desire to secure better conditions of employment, but in this case the Committee can show a splendid record of concessions which

Digitized by Google

on the whole make the lot of the men better than that endured by similar workers in other towns. It may be urged that the tramways are a highly profitable undertaking, and that the first consideration should be the men engaged in working the service. This is not a principle from which we would dissent, but the line has to be drawn somewhere. After all, there are others interested in the success of the tramways, and it is a moot point whether or not the time has arrived for greater advantages to the public who make the success of the system. Only recently the decision was arrived at that it was inexpedient to grant cheaper fares in the early hours of the morning."

Mr. Fearnley shows that the motormen and conductors are the best paid in the United Kingdom, save for a decimal advantage in the case of West Ham, owing to conductors there being given the same rate of pay as motormen. During the last nine years, as the men admit, they have never come away empty handed from an interview with the Committee, and they acknowledge that in that period they have received concessions to the value of £15,000. After as short a period of service as three months, a conductor is permitted to qualify as a motorman, and can then reach the maximum rate of pay with twelve months' service. The system of meal reliefs is the most costly system known on any tramway, and it has only been continued at the special request of the men. The payment for hilly routes is so much higher than any rate paid in other towns that the Committee frequently refrain from quoting it. Under these conditions there are a large number of men who have recently come into the department who are receiving, within a period of from six months to two years, an advance of at least 50 per cent. upon the wages they were receiving before entering the employ of the department. That these conditions are appreciated is shown by the manager's statement that the men have brought to bear upon the department all the influence which they are capable of doing in order to secure the admission of relatives and friends, and that, almost without exception, members of the Tramways Committee and members of the Council who are not members of the Committee are inundated with applications for support of men who are desirous of entering the service. Adverting to statements that during the past two years of good trade a number of employees have left to take situations elsewhere in this country and in the Colonies, Mr. Fearnley says it should be added that a considerable number of these men have intimated their desire to come back, and as an instance it may be stated that three applications have been received during the past few days. A tabulated statement of the wages paid for the week ended July 12 shows that the highest payments to motormen were between £2 10s. and £2 13s., and the lowest between £1 15s. and £1 16s., while in the case of conductors the payments were from £2 5s. to £2 9s. and £1 8s. to £1 9s. Dealing with assertions made with reference to the wages of timekeepers, pointsmen, etc., Mr. Fearnley says that the men making these statements must know that the majority of the men referred to are, with few exceptions, to all intents and purposes, pensioners on the department. The truth of the matter is that, in return for their payment to the union, the men expect to be given an annual dip into the pockets of the ratepayers. This much is revealed in a signed letter from a union man, published in a local journal, in which he states that to accept the present concession as final "would split the Association in Sheffield in two." He adds that only those who have been engaged in the building up of the branch know the hard work and sacrifices that have been made, and they simply cannot contemplate the possibility of all that work being thrown away.

## THE MOTOR TRAFFIC INQUIRY.

### Evidence from Liverpool and Manchester.

On July 18 the Chief Constables of Liverpool and Manchester were examined before the House of Commons Select Committee on power-driven traffic in London as to the traffic conditions prevailing in their respective cities.

Mr. F. Caldwell, M.V.O., Chief Constable of Liverpool, said the tramway system carried last year 134,249,967 passengers, and the mileage was 12,590,408. The number of tramcars each day in use was 8,434. The number of cars crossing busy street junctions was in one case 4,737, in another 4,667, and in several others about 3,500 per day. There were a number of very congested points where the light traffic crossed the heavy traffic, such as the approaches to the passenger landing-stages and the Riverside Station, etc. The traffic at all important street junctions was regulated by a constable. His power of regulation and control was derived from the Liverpool Improvement Act, sec. 273, which empowered the Lord Mayor to make traffic regulations, and permanent regulations were then made for all important points. Heavy slow traffic was kept to the left side of the road, leaving the middle of the road free for light fast traffic.

Tramcars were passed on the left or near side. The police were instructed to prosecute drivers of vehicles who passed too quickly past a tramway stopping place where passengers and a car were, and the question of speed was not so important as the circumstances of each class of traffic. In addition to the men on special traffic duty at fixed points, mounted police patrols were used in a number of the principal thoroughfares, as they were very useful in enforcing the rules of the road, preventing obstruction, and in streets where there was heavy horse-drawn traffic, in seeing that the proper space was kept between the carts to allow pedestrians to cross.

The number of accidents during the past year was:—Fatal, 27; injury only, 1,625; caused by horse-drawn vehicles, 12 and 632; tramcars, 7 and 519; motor cars, motor cycles, and other mechanically-propelled vehicles, 8 and 474. During the year 34 persons who had been knocked down or fallen in front of tramcars were pushed clear of the track by the plough lifeguards. He did not know of a case where the lifeguard failed. In the majority of cases the accidents were caused by carelessness on the part of the pedestrians.

By Mr. W. Thorne: There were only a few motor 'buses, and these were owned by the Corporation and used in the suburbs.

By Mr. Harris: A growing difficulty was dealing with a tramway stop and the passage of light vehicles, but there was no special by-law.

Mr. Kellaway: Your mortality rate for street accidents per 1,000 of the population is only 2.5. That is the best record except that for Bristol. There is this peculiarity, that in Liverpool there is a very complete system of electric tramways running in congested thoroughfares?—Practically the whole city is covered with tramlines, and we have no competing service of motor cars.

Do you regard the presence of electric tramways as rendering the control of traffic more difficult than it would be with any other form of traffic?—I personally look upon tramways as being a less dangerous form of traffic than a motor 'bus service.

### Chief Constable of Manchester.

Mr. R. Peacock, Chief Constable of Manchester, stated that the traffic problem was acute, and had been under the consideration of the authorities for many years. The difficulty of dealing with it was increased by the fact that there was no underground or overhead method of transit in the city. The total number of tramcars running daily was between 800 and 900, and during the busiest hours tramcars passed through some of the most congested thoroughfares at the rate of 66 per hour. The speed of the cars between certain points within the central area varied from 4.18 miles per hour to 5.96 miles per hour, while outside the central area it averaged about 10.71 miles. The low speeds at which the cars were run in the central portion tended to increase the congestion, and also greatly increased the cost of running. If the cars in the central area could be run at an average speed of eight miles an hour it was estimated that it would save between £20,000 and £30,000 per annum in the working expenses, and would tend to relieve the general congestion. Manchester had spent £2,365,669 in the last fourteen years in street improvements. The remedy for the congestion must be found in regulations enforceable by statutory authority.

A great contributory cause to the congestion was the growth of mechanically-propelled vehicles. Eight thousand motor vehicles had been registered. In recent years motor traction for the conveyance of merchandise had increased considerably. Section 1 of the Motor Car Act, if properly applied, was sufficient to deal with all cases of reckless or negligent driving. In 1911 there were 7 fatal accidents caused by horse-drawn vehicles, 3 by tramcars, 6 by motor cars, 8 by taxi cabs, and 7 by other mechanically-propelled vehicles. In 1912 the figures were:—Killed by horse-drawn vehicles 16 persons, by tramcars 7, by private motor cars 6, by taxi cabs 5, by other mechanically-propelled vehicles 4. The number of non-fatal accidents was as follows:—1911: By horse-drawn vehicles 358, by tramcars 317, by motor cars 231, by taxi cabs 154, by motor cycles 51, by other mechanically-propelled vehicles 57; total, 1,168. 1912: By horse-drawn vehicles 372, by tramcars 349, by private motor cars 123, by taxi cabs 163, by motor cycles 53, by other mechanically-propelled vehicles 36; total, 1,096.

Digitized by Google

In 1902 the Corporation obtained powers to make regulations (a) prescribing the line to be kept at any street crossing by all persons riding or driving, and (b) requiring the drivers of heavy and slow-moving vehicles to keep their vehicles to a particular portion of the street. Regulations were made and duly put into force with beneficial results to the traffic, public safety, and convenience. A few years ago, however, an appeal against a conviction was made, and the Court quashed the conviction on the ground that no offence was committed unless a warning was given by a constable stationed in the street to direct the traffic. The effect of this ruling was to render the regulations inoperative, as only a small portion of the force was exclusively engaged in the direction of traffic.

The Committee adjourned indefinitely, the Chairman intimating that he would call them together when he had prepared a draft report.

## TRAMWAY LABOUR TROUBLES.

THE STRIKE AT EDINBURGH.

At the height of its tourist and holiday season, Edinburgh has this week been deprived of its cable car service by a strike of tramwaymen, who, to the number of 680, ceased work on Friday night, July 18. The men asked for an increase of a halfpenny per hour, and the company offered a farthing per hour increase, which was refused. The men point to the large dividends now earned by the company (last year the dividend was 40 per cent.), and, looking to the increased cost of living, claim that they are entitled to a larger share of the profits.

On the other hand, the directors of the company state that for fourteen years prior to 1908 they were not able to pay dividends, and that the shareholders were entitled to set that fact against the large dividends earned now. The company have imported about fifty "spare" drivers from the Manchester district, and about ninety of the old hands returned during the week. These men, however, have had no experience of the cable car system, and they have undergone training in the Shrubhill depôt during the week, under the direction of Mr. Harris, the engineer. On Tuesday three cars were run out, having on board Mr. C. W. Shepherd, the general manager, and about 30 of the Manchester men. All three were in charge of experienced drivers, and the first car was cheered by the crowd outside the Shrubhill depôt.

A meeting of the Edinburgh magistrates was held on Tuesday, at which it was intimated that applications were to be made for licences for the new drivers and conductors. It was agreed to hear the applications on Friday. Hitherto 21 days' training has been insisted on before granting the licences.

The Amalgamated Association of Tramway and Vehicle Workers of which Alderman Jackson, of Manchester, is secretary, sent a letter to the local committee in which he said that if the men lost their heads and declared a strike, the best advice he could give to the union members was to remain at work. The local secretary followed the advice of Alderman Jackson. The directors of the company have complained that the deputation of the men who twice met them and the manager agreed to recommend the employees to accept the board's offer; yet they are now the leaders of the strike. How is it possible, the directors ask, to negotiate with men who sign an agreement one day and strike the next?

A partial service was instituted on the Post Office and Nether Liberton route on July 23, by four cars, each carrying four constables. Yesterday 28 cars were running. The Lord Provost has agreed to write to both parties suggesting the holding of a conference, with himself as chairman.

STRIKE BALLOT AT SHEFFIELD.

The Sheffield Tramways Committee at a special meeting on July 22, refused to grant further concessions to their employees, and thus comply with the application of the men for pay at the rate of time and a half for all Sunday labour. The Committee had already decided to grant the request in respect to motormen and conductors with over five years' service, and that the shilling a week merit pay at present given to car cleaners of ten years' service be extended to night shed men and other mechanicians of ten years' approved service. The Committee are also prepared to refer the question in dispute to the arbitration of some independent person, to be appointed by the Board of Trade. The union officials, who claim that 97 per cent. of the men are organised, state that a ballot will be taken as soon as possible on the question of ceasing work.

The publication of the Tramways Committee's resolution was accompanied by the appearance in the local papers of a two-column letter which Mr. A. R. Fearnley, the general manager, had been instructed to forward to the union secretary. Appended are some extracts from the document:—

"The Committee are not prepared to admit the principle that the same rate of pay should be given to men who have only been in the employ of the department for a comparatively short period as to those who have had a more lengthened service.

"The following table shows the wages paid per car mile run on sixteen of the principal municipal tramways in the country:—

| | | | |
|---|---|---|---|
| West Ham ... ... ... | 2.597d. | Sunderland ... ... ... | 2.137d. |
| Sheffield ... ... ... | 2.347d. | Birkenhead ... ... ... | 2.113d. |
| London County Council ... | 2.199d. | Leeds ... ... ... ... | 2.113d. |
| Newcastle-on-Tyne ... ... | 2.183d. | Nottingham ... ... ... | 2.11d. |
| Halifax ... ... ... | 2.166d. | Bradford ... ... ... | 2.045d. |
| Glasgow ... ... ... | 2.163d. | Manchester ... ... ... | 2.040d. |
| Leicester ... .. ... | 2.150d. | Rotherham ... ... ... | 1.987d. |
| Liverpool ... ... ... | 2.138d. | Hull ... ... ... ... | 1.93d. |

"The difference between the Sheffield and the London County Council figures on the Sheffield mileage means increased wages in favour of the Sheffield motormen and conductors to the amount of £4,977 4s. 7d. per annum. Ditto Halifax, which is the next highest Yorkshire town to Sheffield, £6,087 0s. 5d.; ditto Leeds, £7,869 8s. 1d.; ditto Bradford, £10,156 4s. 10d.; ditto Hull, £14,023 13s. 9d. The only reason why the West Ham figure is above that of Sheffield is on account of their paying the conductors at the same rate of pay as the motormen."

MEN TO VOTE ON THE PROPOSAL TO ARBITRATE.

The committee of the men's union on July 24 published a reply to the general manager's letter, the communication concluding as follows:—"The question of arbitration opens up an entirely new situation. We have submitted our case to the committee, and believe we have established our claim, and if the committee, on their part, can leave their case in the hands of an independent chairman, well, then the men have the same faith. The men must decide this question for themselves, and the first opportunity will be taken to place the matter before them. The committee realise that the onus of a quarrel is now placed upon the men and to refuse arbitration would prejudice their case in the eyes of the public. The committee have recommended that the men be approached at once, and their opinion taken, and future actions will be determined by the result of the meetings."

## THE RATING OF TRAMWAYS.

JUDGMENT BY THE HOUSE OF LORDS.

The House of Lords on Thursday gave the important decision that tramways in England are liable to pay rates on the whole of their annual value and not on one-fourth as is the case with railways. This decision was arrived at in the well-known case of the Urban District Council of Tottenham *v.* the Metropolitan Electric Tramways, Limited, and it involved reversing the finding of the Court of Appeal and restoring that of the Divisional Court.

No difficulty arose on the facts of the case. The electric tramway company are owners or lessees of tramways and light railways in Middlesex. Tottenham District Council in 1910 for the purposes of the general district rate assessed on the full net annual value tramways of the company in Tottenham. Contending that their lines in fact constituted a railway and as such were (under the Public Health Act) only liable to be assessed in the proportion of one-fourth of their net annual value, the company paid only £123 18s. 2d., or a quarter of £495 12s. 6d., the sum demanded by the rating authority. On the matter being referred to the Courts as a test case, the Divisional Court held that the tramways should pay on their full annual value, but the Court of Appeal reversing that decision held that these tramways should only pay on one-fourth. The House of Lords restored the judgment of the Divisional Court.

In the system of the Metropolitan Electric Tramways, Limited, in Tottenham, a part of the lines was described as "tramways" (having been authorised as such) and another as "light railways" (having been authorised by Light Railway Order). The judges in the Court of Appeal stated that, so far as physical construction and appearance went, the light railways and the tramways were identical. Carriages used on tramways ran through, and over the light railways, and the electrical propelling energy was derived from a common scource. The Tottenham District Council urged that the tram lines were not "land used only as a railway" within the meaning of Section 211 of the Public Health Act, 1875. The light railways are rated on only one-fourth of their net annual value in accordance with the decision of the House of Lords in the Wakefield case.

The LORD CHANCELLOR, in moving on Thursday that the appeal should be allowed and the finding of the Divisional Court restored, said that both he and Lord Shaw agreed with the judgment which Lord Moulton would deliver.

Lord MOULTON then read an exhaustive judgment in the course of which he said that when tramways were started they were in the hands of private companies, and the Legislature was not disposed to treat them too liberally. On the other hand, under the Light Railways Act, 1896, the Legislature gave many advantages as an inducement to promoters. It seemed to him that light railways, running, as they did in many cases, over land owned by the promoters, could get but very small advantage from municipal expenditure of the rates, such, for instance, as the lighting and sewering of roads, and therefore were justly entitled to contribute to the rates at one-fourth of their assessment. But that was not the case with a tramway running along main streets, for the pavements might in a sense be said to be the platforms for the use of their passengers, and they got full advantage of the lighting and general expenditure on the streets paid for by the rates. He thought the distinction between a light railway and a tramway or tram road was clearly understood, both by the popular and the legal acceptation of the two terms respectively, and that if the partial exemption from rates conferred on light railways by the Public Health Act, 1875, was intended to extend to tramways the Act would have made it clear in terms. In the present case the subject of taxation was not a railway but a tramway, constructed under Acts which were specifically Tramway Acts, and subject to the privileges and disabilities given to tramways by the public legislation relating to them. There remained only one head of argument, standing entirely by itself, which must be noticed, and which at first appeared to possess great weight. The Tramways Act, 1870, applied to Scotland. The cases quoted on behalf of the respondents showed that tramways in Scotland were valued by

Digitized by Google

a functionary known as the railway and canal assessor, a fact which at first sight would appear to show that in Scotland tramways possessed the legal status of railways and were treated as such. If this were the case, it would give great weight to the contention that they ought to be so treated in England, and to enjoy the exemption as to rating granted to railways. But when the matter was looked into more closely, it assumed a very different appearance. The rateability of the tramways in Scotland was established by a decision which rested not upon their being railways, but—as in England—upon their being in occupation of land. It was true that, in consequence of that decision, tramways came to be valued by the railway and canal assessor, but this did not imply that they were recognised as having the legal status of railways, because the functions of the railway and canal assessor were not confined to valuing railways and canals. He could be called upon to value waterworks, gasworks, and any other concerns which traversed more local units than one; and, seeing that he had such special experience, he evidently was the most suitable person to value such a subject as the continuous route of a tramway. But the matter in Scotland was put in a position still more widely different to that in which it stood in England by the Burgh Police (Scotland) Act, 1892, which, by Section 147, expressly provided that railways and tramways *eo nomine* should be entitled to a three-quarters reduction. This did not apply to counties where both railways and tramways were rated at their full value, nor did it apply to parishes where there was a power of classification of property. Inasmuch as the Act did not apply to England, it was immaterial to the decision of the present case. For all these reasons he was of opinion that in public legislation the word "railway" did not include tramways unless it was expressly made so to do by the terms of the Act. To hold otherwise would be to put tramways under the exclusive jurisdiction of the Railway and Canal Commissioners—a thing which had never been suggested during the forty years of the existence of that Court, and was obviously contrary to the intentions of the Legislature in creating it. The word "tramway" had had both popularly and legally a distinct meaning for the last 40 years, and although the action of the Light Railway Commissioners might have produced some confusion and had certainly led to the exemption being obtained in cases in which it was not merited, this could not affect a case like the present, where the subject of taxation was neither legally nor popularly a railway. He was therefore of opinion that the judgment of the Divisional Court should be restored and the respondents should pay to the appellants their costs here and below.

## L.C.C. TRAMWAY MATTERS.

NEW LINE AT FOREST HILL.

At last Tuesday's meeting of the London County Council the Highways Committee reported that the street widenings along the route of the authorised tramways from London Road to Park Road, Forest Hill, would probably be completed towards the end of this year, and the Committee considered that arrangements should be made for the construction of the lines. These would connect existing tramways and enable through car services to be run between Dulwich and New Cross and Rushey Green. The estimate of cost for construction on the conduit system, including trackwork, lowering of the roadway under a railway, rails, and electrical equipment, was £16,050. Approval was asked for the necessary estimates.

GREENWICH POWER STATION EXTENSION.

In regard to the question of the construction of foundations for the first two turbo-generators to be installed in Greenwich power station, the alterations to give increased capacity to the coal bunkers and ash hoppers, and the provision of additional workshops, etc., the Committee reported that the first turbine foundation would require to be completed by the end of the present year. Before this work could be commenced it would be necessary to demolish the foundation of one of the reciprocating engines. The Committee proposed that the foundation work should be carried out as a separate contract on the basis of a schedule of prices as this would enable a contract to be placed at an early date, and approval was asked of an approximate estimate of £6,500 for this work, and it was proposed that tenders should be invited from selected firms.

These reports stood over for a week.

CENTRAL CAR REPAIR DEPOT.

The Committee recommended that tenders be invited from selected firms for the erection of part of the third section of the central car repair depôt.

TRAVELLING CRANE FOR GREENWICH STATION.

The following tenders were received for the supply of a fifty-ton overhead travelling crane for Greenwich generating station :—

| | |
|---|---|
| Babcock and Wilcox ... ... ... ... | £2,285 0 0 |
| Cowans Sheldon and Co. ... ... ... ... | 2,809 10 0 |
| Joseph Booth and Bros. ... ... ... ... | 2,970 0 0 |
| Carrick and Ritchie ... ... ... ... ... | 2,989 0 0 |
| S. H. Heywood and Co. ... ... ... ... | 3,392 10 0 |

The estimate of the chief officer was £2,200. The Committee proposed that the tender of Babcock and Wilcox should be accepted, and that that firm be allowed to sublet as under :—(1) General Electrical Company and British Westinghouse Company, electrical equipment; (2) Lanarkshire Steel Company, or the Steel Company of Scotland, steel sections; (3) Stewarts and Lloyds, cast steel.

THE LONDON UNITED PURCHASE.

In regard to the arbitrator's award in connection with the purchase by the Council of the portion in London of the undertaking of the London United Tramways, the Committee recalled the fact that there were several points on which the Council had given notice of appeal, and the company were also appealing on other points. The Committee were at present in negotiation with the company with regard to the working of the tramways after purchase, and they had accordingly made arrangements that all litigation on the matters in dispute should be postponed for the present pending an agreement being arrived at as to the working of the lines. If a satisfactory agreement was come to it might not be necessary to proceed with the litigation.

Following up a policy already acted on, the Committee proposed that the Council should now take steps to carry out necessary repairs on further portions of the London United Tramways about to be taken over by the Council. The tracks proposed to be dealt with were in Goldhawk Road and King Street, and on the Hammersmith loop. The cost of the work was estimated at £10,700, and it was proposed that it should be proceeded with at once. The company would be prepared to carry out the work on the lines agreed to as regarded the parts of the track work last reconstructed. The Finance Committee reported that the expenditure should be regarded as incidental to the cost of the purchase of the part of the undertaking in London. The total amount expended, or to be expended on the reconstruction of nearly eight miles single track was £51,800. This comprised all but about two miles of the lines to be purchased.

These reports were adopted.

## MISCELLANEOUS NEWS AND NOTES.

**Electrification of Morecambe Tramways.**—The Tramways Committee have instructed the borough electrical engineer, Mr. L. B. Hogarth, to prepare an estimate for the electrification of the horse tramways.

**Tramways Extension at Swansea.**—After holding a local inquiry the Light Railway Commissioners have granted an Order for the construction of tramways on Town Hill as recommended in a scheme prepared for the Town Council by Mr. Stephen Sellon. The object of the proposal is to develop Corporation lands for the provision of workmen's and other dwellings. The working of the railways on the gradients involved will be subject to approval by the Board of Trade.

**Liverpool Corporation Tramways** have obtained from the National Steam Car Company, Limited, of Moulsham Works, Chelmsford, a new steam chassis of the maker's standard 32 h.p. type. Leaving London at five o'clock on Wednesday morning, the chassis travelled to Liverpool under its own steam, arriving at seven o'clock in the evening of the same day, after covering a distance of 210 miles. Mr. Clarkson accompanied the chassis. A motor 'bus body will be erected on this chassis at the Lambeth Road Car Works of the Liverpool Corporation.

**Proposed Strike in the Ashton District.**—A strike ballot was taken on July 23 of the employees of Ashton Corporation Tramways, Stalybridge, Hyde, Dukinfield, and Mossley Joint Tramways Board, and Oldham, Ashton and Hyde Tramways Company, on the question of enforcing their demands for increased wages and extended holidays. It is announced that 96½ per cent. of the members of the union had voted in favour of a strike, and that the other 3½ per cent. were either against it or did not vote. The next step will be to get the sanction of the general executive to proceed with the strike, in the event of the demands of the men not being conceded.

**Success of the P.A.Y.E. Cars at Aberdeen.**—Mr. R. S. Pilcher, general manager of the Aberdeen Tramways, in his annual report issued on July 22, stated: "On April 28, 1913, the Council inaugurated the "pay-as-you-enter" principle on the Woodside section. Six new cars were built, and four altered and made suitable for the operation of this system of fare collection. These cars have been in service for some time now, and the public have become accustomed to them. We find that there is no congestion or delay through the prepayment of fares. The passengers have accomodated themselves to the system, and have their fares ready, whilst there have been no rear platform accidents. The receipts have gone steadily up, and although there is a natural increase taking place on this route, there is a large part of the increase in receipts due to the prepayment of fares. It is well known that under the usual method of collecting fares there is a considerable leakage, due mainly to the inability of the conductor to attend to his numerous duties and to collect all the fares." The year under review has been the most successful in the history of the undertaking.

## CONTRACTS AND ORDERS.

**Siemens-Schuckert, Limited,** have obtained a contract for the electrification of the Necochia (Argentina) tramways.

**East Ham Council** have accepted the tender of Callender's Cable and Construction Company, at £55 10s., for the supply of a feeder pillar.

**Croydon Council** have accepted the tender of Le Grand and Sutcliffe, of London, for a deep-well pump for the electricity works, at £435.

**Walthamstow Council** have placed a contract with the Blasberg Engineering Company for the erection of a natural draught cooling tower at the generating station, at £980.

**Ramsbottom Traction Committee** have recommended the Council to accept the tender of the Lancashire Electric Power Company for a switchboard at the electricity works.

Digitized by Google

**The Titan Trackwork Company, Limited,** have secured contracts from the Merthyr Tydfil tramways, the Birkenhead Corporation tramways, and the Pelotas Electric tramways.

**Keighley Council** have placed a contract with the Cedes Electric Traction Company, Limited, for a spare pair of hind wheels, with armatures complete, and a spare current collector and flexible wire to the disconnecting socket, for the railless trolley vehicles, at £123 10s.

**London County Council** have accepted the following tenders:—Electric Construction Company, charging apparatus for electrically-driven fire appliances at Hammersmith fire station, £158; Babcock and Wilcox, fifty-ton overhead travelling crane for Greenwich power station, £2,285; Burt, Bolton and Haywood, 50,000 creosoted deal paving blocks required in connection with the diversion of tramway tracks in Wood Lane, delivered by van on the site, £7 6s. 10d. per thousand, total £367 1s. 8d. The Highways Committee have reported, without mentioning the names of the firms, that they have arranged for the purchase of 100 cast steel wheel centres at the cost of £216 18s. 9d., and 1,000 plough leads and 3,500 sliding contact plough leads, at a cost of £518 15s.

## PERSONAL.

**Mr. J. R. Taylor,** chief clerk in the Ashton tramways department, has been recommended for an increase of £13 per annum in his salary.

**Mr. R. H. Schofield,** who has been appointed sales manager to Ferranti, Limited, Central House, Kingsway, W.C., has been with the Ferranti Company nearly twenty years.

**Mr. L. C. F. Bellamy,** manager of Ilkeston Corporation tramways and borough electrical engineer, was married on Wednesday to Miss Eileen Leghorn at St. John's Church, Fairfield, Liverpool.

**Inspector J. Pearson,** of Glasgow Corporation tramways, has been presented with the St. Andrew's Ambulance Association certificate of honour for bravery in stopping a runaway horse. But for his action some of the passers-by must have been injured.

**Sir J. S. Harmood Banner,** M.P., Lord Mayor of Liverpool, who was knighted on the occasion of the King's visit, is a director of the British Insulated and Helsby Cables, Limited, the Midland Electric Corporation for Power Distribution, Limited, etc.

**Mr. George Webster,** the new manager of the Rochdale tramways, joined the staff of the old Rochdale Tramways Company and rose to the position of traffic superintendent. In 1904, when the undertaking was taken over by the Corporation, Mr. Webster was appointed traffic superintendent.

**Aberdare Tramways Appointments.**—The following members of the electricity staff have been appointed to positions in the electricity and tramways department:—Mr. W. J. Williams, as works superintendent; Mr. W. T. Hilder, as outside superintendent; and Mr. G. D. Morgan, as chief clerk.

**Mr. Alfred Clough,** resident electrical engineer to the Liverpool Tramways and Electric Power and Lighting Committee, acting under medical advice has intimated his desire to retire from the service. The resignation has been accepted as and from October 1 next, and the committee have placed on record their appreciation of the services rendered by Mr. Clough to the Corporation and to the community in connection with the management and development of the electric supply undertaking.

## FINANCIAL REPORTS AND MEETINGS.

**Millar's Timber and Trading Company.**—The directors recommend a dividend of 5 per cent. on the ordinary shares.

**Blackpool and Fleetwood Tramroad Company, Limited.**—The board have declared an interim dividend at the rate of 4 per cent. per annum.

**Lanarkshire Tramways Company.**—For the half-year ended June 30 last it is proposed to declare a dividend at the rate of 6 per cent. per annum, as against 5½ per cent. per annum for the corresponding period last year.

**Chatham and District Light Railways.**—The following dividends are recommended by the directors for the half-year ended June 30:—At the rate of 5 per cent. per annum on preference shares, and at the rate of 3 per cent. per annum on ordinary shares.

**The British Electric Traction Company.**—The receipts of all the associated companies of the British Electric Traction Company for the week ended July 18 amounted to £52,627. Upon such of the lines as were working both last year and this year the receipts show a decrease of £389 upon the week.

**Loss on the West Ham Tramways.**—The deficiency of £3,388 on the working of the West Ham tramways for the past year was discussed at the meeting of the Town Council on July 22. A proposal to support the Croydon Corporation in the demand that the Government be urged to pass legislation to place motor 'bus companies on terms of equality with municipal tramways with regard to public obligations was agreed to. The Tramways Committee were directed to report upon the desirability of obtaining powers to run omnibuses in the borough.

## WEEKLY TRAFFIC RETURNS.

The official traffic returns of 67 of the principal undertakings of the United Kingdom for the week ended July 19 amounted to £261,389, or £11,454 more than in the corresponding week last year, while the track mileage was 2,712, or 52 more than for the corresponding week. The receipts were at the rate of £96 7s. 7d. per track mile, an increase of £2 8s. 5d. per mile as compared with last year.

## COPPER AND ALUMINIUM MARKET.

July 25, 1913.

Messrs. Henry R. Merton and Co., Ltd., 2, Metal Exchange Buildings, Leadenhall Avenue, E.C., supply the following quotations of prices per ton:—

**Telephone; No. 2948 GERRARD.**

# WEEKLY LIST OF TENDERS INVITED.

### BOROUGH OF BRIGHOUSE.

ELECTRICITY DEPARTMENT.

The Electricity Committee invite tenders for the supply and delivery of 600 yards of .15 by .075 by .15 Lead Covered Cable; 300 yards of .15 by .075 by .15 Armoured Cable; 720 yards of .1 by .05 by .1 Armoured Cable; and 220 yards of .033 by .022 by .033 Armoured Cable; also 3 Feeder Pillars.

Copies of specifications may be obtained from the Electrical Engineer, Electricity Works, Huddersfield Road, Brighouse.

Tenders, endorsed "Cables" or "Feeder Pillars," as the case may be, to be delivered at my office not later than Saturday, August 9, 1913.

The Council do not bind themselves to accept the lowest or any tender.

JAS. H. ROTHWELL,
Town Clerk.

Municipal Offices, Brighouse,
July 28, 1913.

### GREAT NORTHERN RAILWAY COMPANY (IRELAND

The Directors are prepared to receive tenders for the supply of:—

Bull Head Rails,
Flat Bottom Rails,
Fishplates,
Cast Iron Chairs, and
Permanent Way Fastenings.

Specifications and forms of tender can be obtained from the Secretary.

Tenders, made out on the forms supplied by the Company, should be delivered, under sealed cover, endorsed "Tender for ———," to the undersigned not later than 10 a.m. on Monday, August 25, 1913.

The Directors do not bind themselves to accept the lowest or any tender.

T. MORRISON,
Secretary.

Secretary's Office,
Amiens Street, Terminus, Dublin,
July 30, 1913.

### CITY OF TRURO.

Tenders are invited by the Corporation for the supply and delivery of about—

(a) 700 super yards Artificial Footway Paving.
(b) 6,000 Creosoted Deal Blocks.

Particulars and forms of tender can be obtained upon application to the undersigned, to whom sealed tenders, suitably endorsed, should be sent not later than noon on Monday, August 11, 1913.

The Corporation do not bind themselves to accept the lowest or any tender.

FREDK. A. BARNES,
City Engineer and Surveyor.

Municipal Buildings, Truro,
July 28, 1913.

### LIVERPOOL CORPORATION TRAMWAYS.

ADVERTISING ON TRAMWAY CARS.

The Tramways and Electric Power and Lighting Committee are prepared to receive tenders for the exclusive right to Advertise upon the Tramway Cars for a period of seven years, commencing on the 1st August, 1914.

The number of cars, working and spare, excluding first-class cars, is 496, and the total length of line traversed 119 miles. The total mileage of the cars during 1911 amounted to 12,590,408, and the number of passengers to 134,249,967. The total resident population in the districts served by the Corporation tramway cars amounts to approximately 838,000.

Tenders must be enclosed in the envelope provided, and addressed to the "Town Clerk, Municipal Buildings, Liverpool," and forwarded through the post so as to be received by him not later than the first postal delivery on Wednesday, the 13th August, 1913.

Form of tender and specification may be obtained upon written application to C. W. Mallins, Esq., A.I.E.E., General Manager, Tramways Department, Central Offices, 24, Hatton Garden, Liverpool.

EDWARD R. PICKMERE,
Town Clerk.

Municipal Buildings, Liverpool,
July 21, 1913.

### CORPORATION OF WAKEFIELD.

Tenders are desired for the supply, delivery, and erection of various plant for extensions to the Works of the Electricity Department. The Works are divided into three sections as follows, and tenders will not be considered for a portion only of any section:—

Section 1.—Water Tube Boiler, Superheater, Stoker, etc.
Section 2.—Steam Turbo-Alternator, Condensing Plant, etc.
Section 3.—High and Low Tension Switchgear.

Appointments to view the sites of the works (after August 5) to be made with the City Electrical Engineer, Old Town Hall, Wakefield, who will also supply copies of the specifications and general conditions on receipt of a deposit of £1, which will be refunded on receipt of a *bonâ-fide* tender. Further copies may be had if desired at a charge of 5s. per copy, which will not be refunded.

Sealed tenders, endorsed "Electrical Extensions Section —," must be sent to A. C. Allibone, Esq., Town Clerk, Town Hall, Wakefield, and must be delivered not later than noon on the 1st day of September.

The Corporation do not bind themselves to accept the lowest or any tender.

H. A. NEVILL, M.I.E.E.,
City Electrical Engineer.

### COUNTY BOROUGH OF BURY.

Tenders are invited for the supply of One 2,000/3,000 kw. Turbine Alternator, with Exciter and Surface Condenser.

Copies of general conditions and specification can be obtained from Mr. S. J. Watson, M.I.E.E., Electricity Works, Bury, on payment of a deposit of two guineas, which sum will be returned on receipt of a *bonâ-fide* tender.

Tenders enclosed in the official envelope are to be delivered to the undersigned not later than noon on Monday, August 25, 1913.

JOHN HASLAM,
Town Clerk.

Municipal Offices, Bank Street, Bury,
July 29, 1913.

### HUDDERSFIELD CORPORATION.

The Highways Committee of the Huddersfield Corporation are prepared to receive tenders for Street Watering Motor Vans.

For full particulars apply to the Borough Engineer.

Tenders to be delivered at this office not later than 9 a.m. on Wednesday, the 6th of August next.

K. F. CAMPBELL, M.Inst.C.E.,
Borough Engineer.

Huddersfield, July, 1913.

## POSITIONS VACANT.

### PORT ELIZABETH MUNICIPALITY.

ASSISTANT ELECTRICAL ENGINEER.

The undersigned are authorised to receive applications, on or before August 19, for the appointment of Assistant Electrical Engineer. Candidates must have had a thorough electrical and mechanical training, and be competent to take entire charge of a direct current system, and, in the absence of the Chief Engineer, to formulate and carry out high tension extensions, including generating plant, feeders, etc. Salary £500 per annum. Passage paid outwards. Applicants must state qualifications, age and experience, and forward copies of testimonials.

DAVIS AND SOPER,
Agents of the Port Elizabeth Municipality.

54, St. Mary Axe, London, E.C.,
July 23, 1913.

### GOVERNMENT OF WESTERN AUSTRALIA—PERTH.

The Agent-General for Western Australia has empowered Messrs. Merz and McLellan to receive applications for the position of Chief Station Superintendent for the new combined Tramway and Public Power and Lighting Generating Station with outlying sub-stations in Perth. Until the new station is in commission the selected candidate will have to assist in supervising the erection and setting to work of the new power station, sub-stations, and cable work.

Salary £450 a year on a three years' agreement, to date from arrival in the State. Second-class passage out and home again on satisfactory termination of agreement.

Candidates should have had experience of central station management and the operation and erection of H.T. turbo-alternators, water-tube boilers, rotary converters, static transformers, and in the laying and maintenance of H. T. cables.

Candidates must be prepared to take up the appointment in Perth within next four months.

Application by letter, stating age, whether married or single, full particulars of experience, with copies of three latest testimonials, should be sent at once to Merz and McLellan, 32, Victoria Street, Westminster, London, S.W.

### EXPERT RAILWAY ACCOUNTANT.

The Commission on the Unification of Railway Accounts of Peking require the services of a thoroughly competent Railway Accountant. Annual salary £2,000, with first-class passage out and return. Applications, stating age and previous experience, and accompanied by copies of not more than four testimonials, should be forwarded before August 15 to Dr. C. C. Wang, Chinese Legation, London, W. Correspondence will be considered confidential.

## FORESTALLING AN AGITATOR.

Dublin possesses an agitator who aspires to become known as the "labour dictator," and in order to increase his affluence he conceived the idea of securing the men of the Dublin United Tramways as contributors to his union. Events show, however, that he failed to allow for the existence of Mr. W. M. Murphy, the veteran chairman of the Company. In his fifty years' experience in the employment of labour as a contractor Mr. Murphy has not only avoided strikes but he has never had any serious friction with his men, for the reason that he has always been ready to meet them, not as master to servant but as man to man and a friend in time of trouble. As a railway director, too, he has witnessed the failure of all the railway strikes in Ireland during the past thirty years. Under these circumstances it is not surprising to find, as reported in another column, that Mr. Murphy forestalled the agitator by inviting the men to a meeting, and announcing that the directors had decided to grant them improvements in their conditions that will entail a charge of £2,250 per annum on the company, in addition to £1,500 given two years since. The liberality of the company is evidenced when it is considered that they have no means for recouping the shareholders, as the railway companies have done, by raising their rates. Besides these advantages, so gracefully given, the directors have for some time had under consideration the question of pensions, as a number of the men have thirty years' service to their credit. Hitherto the men, on retirement, have been given pensions without any scale, but in a short time free pensions are to be given to every man of a certain age and who has had a certain length of continuous service. What the men thought of the proposals was shown by the cheers which they gave for the directors and officers, while a motorman was eloquent in testifying that hunger and poverty have been the result of strikes stirred up in other branches of labour in Dublin within the last few years. Mr. Murphy pointed out that the directors are always accessible to any man or section of men, and he was well advised in stating that authority had been given to the manager to dismiss any man who uses threats to induce men to join a union. In taking this course Mr. Murphy, we may add, stands upon strong ground, for both the Royal Commission, whose report gave workmen the right of combining, and the 1911 Commission on Railway Conciliation Boards, were firm in declaring that there should be no intimidation of workers who did not desire to enter the unions. This is a fact of which unionists nowadays are ignorant. An example of their ignorance was shown on July 25, when a deputation of two of the Cardiff union, in submitting to the Cardiff Tramways Committee a plea for increased wages, took with them the secretary of the London branch to put forward an audacious demand that all the local men shall become members of the union by August 16. Sir John Courtis replied that he was not in favour of coercion or tyranny. The Committee would have done well if they had advised the agitator to go and make his demand before the London County Council. Evidently unionism is in a bad way in the Metropolis, or the secretary would not be able to find time to discharge such a task for the Cardiff men. Many of the London tramway men south of the Thames have formed an organisation of their own on purpose to be rid of trade union methods.

## TELEPHONE WIRES CROSSING TROLLEY WIRES.

At an extrordinary meeting of the Municipal Tramway Association held in June last it was decided after full consideration to accept the offer of the Postmaster-General with reference to telephone wires crossing trolley wires, contained in his letter of February 13 last, and amended after a further conference with a special deputation on April 15. We have now received from Mr. C. J. Spencer, hon. secretary of the Association, a copy of the letter referred to, together with an abstract of the points raised at the Conference, slightly amending the terms so far as the cost per circuit is concerned, and a copy of the resolution accepting the terms offered. We give these in full below. A full report of the proceedings at the first Conference on the subject between representatives of the Municipal Tramway Association and the Tramways and Light Railways Association was given in our issue of November 12, 1912.

LETTER FROM THE POSTMASTER-GENERAL.

13th February, 1913.

With reference to the deputation representing the Municipal Tramways Association, which waited upon the Postmaster-General on the 25th of October last, I am directed to inform you that the Post Office engineers have given very careful consideration to the possibility of adopting some method of protecting the telegraphs from tramway power circuits, which while not less effective than guard wires shall not be open to the objections referred to by the representative of the Association.

As the Association is aware, the erection of aerial cable is impracticable in many cases, and it is always more or less unsatisfactory from an engineering point of view as well as being expensive, while the construction of underground work at the Post Office expense where the telegraphs were in dangerous proximity to trolley power circuits, as was explained to the deputation, could not be financially justified. There is, however, now available an insulating material which will admit of the insulation of each wire crossing a power circuit at a comparatively low cost. While in some ways this method of protection may not prove so satisfactory from the Post Office point of view as the provision of guard wires, the Postmaster-General is prepared to adopt it on certain conditions in view of the representations of undertakers that guard wires interfere with the efficient working of their tramway systems. On the new system the cost of insulating a span of one circuit of two wires will be about 11s. 6d.; but the association will readily appreciate the advantage of avoiding continual applications to undertakers for the cost of insulating such circuits added to a crossing. The average number of wires in a bed crossing a tramway route may be taken as sixteen, and I am to suggest therefore that when a tramway undertaker desires to avoid the erection of guard wires, he should pay a first and final charge for each post office crossing (*i.e.*, any arrangement of wires under which all wires are terminated on one side at least on the same support) of £4 10s. when the Post Office is first comer, and £2 5s. when it is second comer.

Of course, when the Postmaster-General is first comer a further initial charge would in each case be made to cover the cost of taking down and re-erecting the circuits already in existence.

Digitized by Google

The proposal to use insulated wire cannot for the present apply to trunk wires and wires running parallel to power circuits for considerable distances. Such works, however, are only concerned in a very small number of cases and cannot materially affect the main question.

The Postmaster-General cannot admit that the obligation of the undertakers to bear the cost of protection is affected by the fact that the Post Office wires may be erected subsequently to the construction of the tramway.

As was pointed out to the deputation, Parliament in the interests of the public has conferred upon the Postmaster-General a right to erect and maintain telegraphs upon and over public roads which is prior and superior to the right of any undertaker acting under statutory powers.

This right is recognised by the insertion in all Tramway Acts and Orders of a clause providing that undertakers shall comply with such reasonable requirements as the Postmaster-General may make from time to time for the protection of his telegraphs. At the conference held at the Board of Trade in 1905 the Post Office contention that the cost of providing protection for the telegraphs should be borne by the undertakers even when the Post Office was second comer was admitted to be reasonable, and it was only as an act of grace that the Post Office agreed to bear one-half the cost.

In view of representations from various bodies that the new methods should be introduced as soon as possible, the Postmaster-General will be glad to learn at the earliest convenient date that the proposals are regarded as satisfactory.

I am, Sir, your obedient servant,
A. M. OGILVIE.

On April 15 a deputation from the Municipal Tramways Association and the Tramways and Light Railways Association waited upon the Postmaster-General, when the following three points were raised :—

(1) That, as the acquisition of the National Telephone Company's plant by the Post Office had altered the situation, the arrangement concluded in November, 1905, under which in second comer cases the Post Office paid half the cost of protection should be revised in favour of the undertakers.

To this the Postmaster-General replied that the general purchase agreement between the Postmaster-General and the National Telephone Company was known before the arrangement (having been approved by Parliament after public discussion in August, 1905); that even apart from this, the acquisition of the National Telephone Company's plant did not affect the matter, which was a question of principle; that the arrangement made in 1905 was, as stated by the Board of Trade, offered as a final settlement and accepted accordingly, and that, if the question were re-opened he should go back and decline to bear any part of the cost even in second comer cases.

(2) Whether the Postmaster-General was willing to regard the Post Office as second comer where existing guard wires were taken down at the request of the undertakers, and the necessary protection afforded by the use of insulated wire.

The answer was in the negative.

(3) Whether the Postmaster-General would consider the question of revising the calculated average number of 16 wires in a crossing.

An offer was made for the present, at any rate to charge for protection at the rate of 5s. 9d. per circuit in second comer cases, 11s. 6d. in first comer cases, and to render an annual account to the various undertakers for the work actually done over their lines.

RESOLUTION PASSED BY THE MUNICIPAL TRAMWAYS ASSOCIATION.

That this extraordinary general meeting of the Municipal Tramways Association held on June 18, 1913, having heard the report of the Executive Council on the negotiations with the Postmaster-General regarding telegraph and telephone wires crossing tramway wires, recommends the municipalities to accept the offer of the Postmaster-General contained in a letter from the Post Office dated February 13, 1913, and amended at a Conference which a special deputation had with the Postmaster-General on April 15 last, as being the best terms obtainable from the Post Office.

This meeting at the same time desires to record its keen disappointment that the Postmaster-General has not seen his way to reconsider the principle of this matter, seeing the change which has taken place by the taking over of the National Telephone Company's system by the Post Office, which circumstance has in the opinion of this meeting entirely altered the condition of things obtaining at the time of the agreement arrived at in 1905.

---

**Settlement of Edinburgh Strike.**—After lasting for twelve days, the strike of the Edinburgh tramway employees came to an end on July 31, on the following terms :—(1) All men on strike to be reinstated to their former positions; (2) the directors to receive the representatives of the men; (3) the farthing increase per hour be accepted; (4) a week's holiday per year be given to the men with pay, to start immediately; (5) the Lord Provost to preside at a conference in September or October to adjust other outstanding grievances, such as fines, and various other questions. The terms were agreed to at a conference presided over by the Lord Provost. Prior to the meeting, 37 cars had been put in service, each car being accompanied by two constables. By some strange procedure the union headquarters had come to recognise the strike, and collections in the city up to Tuesday had realised £265. The magistrates on Tuesday refused to license the drivers put forward by the manager, apparently because each man had had experience only on one section.

## ILFORD'S PROPOSAL TO THE L.G.O.

OBJECTIONS TO THE TERMS FOR THROUGH TRAMWAY SERVICE.

A report from Mr. L. H. Harvey, the new manager of Ilford Council Tramways, was adopted at the July meeting of the Council. Mr. Harvey recommended that the Council should for six months try a partial scheme of through running which had been discussed between himself and Mr. Holmes, the manager of the Barking Tramways, subject to a universal penny fare being adopted and also subject to the London General Omnibus Company agreeing at the same time to abolish half-penny fares in the district, as arranged verbally by Mr. Harvey with their manager some time ago. An alternative scheme of through running with Barking was also submitted. The Tramways Committee recommended that negotiations be entered into with the Barking Council. They further reported that they had instructed the manager to negotiate with the Omnibus Company with regard to the adoption by them of universal penny fares in the Ilford district.

During the discussion objection was raised to the proposed abolition of half-penny fares, and an undertaking was given that the whole question would come before the Council for discussion before half-penny fares were abolished.

Mr. Holmes reported that he had had 23 interviews with the London and West Ham Tramways authorities on the question of through running. "Their suggestion," he said, "is that in return for the Barking inter-running we should allow every other car now running from Aldgate to our Clock Tower to run to Chadwell, in addition to our own present service, that we should receive the fares that these cars take in our area, and that we should pay the through authorities for their cars the sum of 5¼d. for every car mile run by them on our lines. Roughly worked out, this scheme would mean that we should have to pay the through authorities over £10,000 per year for their cars in our area, and we should perhaps get £5 or £10 per week extra takings by their cars on the High Road route. If, on the other hand, these through cars in our area were to displace an equal number of our own cars, then it would mean that we should be paying a far greater price for strange cars to do our local traffic, which we are capable of doing ourselves at a cheaper rate, as it does not cost us 5¼d. to run our cars. Not only this, but the excessive current used and the extreme wear on the track by reason of their heavy cars would be matters of great moment to us, and, moreover, a number of our cars would be laid up and our staff reduced, with the only result that Ilford would have a very much more irregular local service at a greater cost than it has at present. In either event, it appears that the through cars would be the only ones to benefit by the scheme, due to the fact that they would enlarge their picking-up ground for their through traffic, with practically no benefit to Ilford. It is an undoubted fact, shown by the census I have taken on several occasions, that the through cars cannot possibly give a regular local service in Ilford, owing to the inevitable delays on their route further up the line, and this is emphasised by Barking having protested already against the inadequate local service by the through cars on the Poplar route.

"Another point that must not be lost sight of is, that owing to the extreme weight of the L.C.C. and West Ham cars, and, in my opinion, to the method of using the magnetic brake by the motormen, the question of permanent way renewals would be a very serious one. Our rails are light in section, far lighter than those of the L.C.C., and they would be very quickly worn out, far sooner indeed than the period of our loans allows for, and this would mean that our rails would have to be renewed out of revenue, as we are, of course, unable to get fresh loans granted until the expiration of the old ones. The question of renewing rails out of our present revenue is out of the question, and, moreover, our reserve fund is approaching depletion, and nothing therefore would be left except to raise a rate in aid of the work. As a matter of fact, our short length of track on Ilford Hill, upon which the through cars are now running, will shortly have to be renewed, owing to the extreme wear, and this work will have to be paid for out of what reserve funds we have remaining."

## IMPERIAL MOTOR TRANSPORT CONFERENCE.

The Marquis of Crewe addressed the delegates of the Imperial Motor Transport Conference at their inaugural meeting at Olympia on July 21. He said it was a matter of pride to them, particularly in an age when they in England were sometimes prone to carry self-depreciation to an almost humiliating length, to be able to say that in the matter of mechanical transport for commercial purposes they might claim to stand ahead of any other country in the world. It was most appropriate that the conference should meet in London, because there was no place where the problems of transportation were nearly so urgent or so difficult.

The Hon. Arthur Stanley, M.P., succeeded Lord Crewe in the chair on the first day, when the attendance included many representatives of municipal authorities in this country. Sir Boverton Redwood and Professor V. B. Lewis submitted a paper on petrol substitutes for use in motor vehicles, in which they contended that the manufacture of motor spirit on a really larger scale either from shale or from coal was a somewhat complicated industrial problem. On the other hand alcohol could be made in almost unlimited quantities, with the immense collateral advantage of creating a new industry which could not fail to be of the greatest importance, but would benefit agriculture and give us a fuel that could not be cut off in time of war. Under existing conditions

Digitized by Google

alcohol was not an ideal fuel, but there was reason to believe that the objections which had hitherto attached to its use in motor vehicles might be overcome, and the gain in overcoming them would be so very great that there was ample justification for taking such action as might be necessary for that end. The first step was to construct a motor specially suited to this fuel.

The conference adopted the following resolution, on the motion of Sir Boverton Redwood :—"That having regard to the high price of petrol and the limited quantities of petroleum, coal and oil shale available and the obvious fact that these sources of volatile liquid hydrocarbons are in course of depletion, it is desirable that attention should be directed to the construction of a motor suited for use with alcohol, and that, concurrently, action should be taken with a view to the ultimate creation of an adequate supply of fuel obtainable at a sufficiently low price." It was resolved that a committee should be appointed to further the idea and to suggest ways and means. Mr. A. W. Southey submitted a proposal, which was seconded by Dr. Lessing, to the effect that an adequate amount of spirit could be obtained from coal-tar oil. This, however, was negatived.

On July 24 Colonel H. C. L. Holden dealt with the standardisation of mechanically-propelled commercial vehicles for military purposes in time of war, and Captain A. E. Davidson, secretary to the War Office Mechanical Transport Committee, read a paper dealing with the situation which would be created on the outbreak of war, to meet which the War Office had offered a subsidy to makers and owners of vehicles fulfilling certain conditions.

Resolutions were carried recommending consultation between the Government, military authorities, users, and manufacturers throughout the Empire on the subject of mechanical transport subsidy and that a permanent Imperial Motor Transport Committee, provided with subsidies from the Governments and Chambers of Commerce of the Empire, should organise visits of automobile designers to the Oversea Dominions to obtain the data requisite for improvements in self-propelled vehicles.

Other papers included one on motor transport in South Africa, with special reference to the railway service, by Mr. W. W. Hoy, general manager of the South African Railways and Harbours; and on the relations between British manufacturers and oversea buyers by Mr. G. Hamilton-Grapes.

## PROTECTIVE DEVICES AT GREENWICH POWER STATION.

At the meeting of the London County Council last Tuesday a specially important report was presented by the Highways Committee upon the subject of guarding against breakdowns at Greenwich power station. The Committee stated that they had given special consideration since the serious breakdown of plant at the station in April last to the question of arranging for the installation of protective devices with the object of guarding against breakdowns in future. Mr. A. L. C. Fell, chief officer of tramways, had conferred with Mr. G. W. Partridge, chief engineer of the London Electric Supply Corporation, and as a result the chief officer had submitted certain proposals. The cost of giving effect to the scheme was estimated at £25,000, including £7,000 for the switchgear required for the two 8,000 kw. turbo-generators, which the Council on May 6 last decided to obtain from the British Westinghouse Company. The Committee were strongly of opinion that these protective devices should be installed, and they recommended accordingly. They also proposed that Mr. Partridge should be paid 200 guineas.

The Finance Committee, reporting on the matter, said that the principal question which arose from the financial point of view was the bearing of this expense, regarded as an insurance against further breakdowns. A breakdown such as that which occurred recently was a very serious matter as regarded loss of revenue, and it was also very important to establish and maintain the prestige of the tramway undertaking for reliability. If this could be secured by the expenditure proposed the money might perhaps be regarded as well spent. While this was so, this new charge on the undertaking at the present time in order to preserve existing revenue was a serious matter. The report was approved.

## L.C.C. TRAMWAY MATTERS.

The London County Council held their last meeting before the summer recess on Tuesday, when voluminous reports were presented by the various Committees. The Council sat from 3 p.m. on Tuesday until 8 a.m. on Wednesday.

### GENERAL ADOPTION OF PASSENGER QUEUES.

The Highways Committee in their report referred to Section 30 of the Council's Tramways Act of 1912, which gives power to make by-laws requiring passengers waiting to board cars at any stopping place or terminus to wait in lines or queues, and to enter the cars in the order in which they stand. The Committee had been in communication with the Home Secretary with a view to the framing of a suitable by-law, and the Home Secretary had intimated that he would be prepared to approve a by-law in the form in which the Committee now recommended. This proposed by-law stated that on occasions when six or more intending passengers were waiting at any stopping place or terminus they should form up in a line or queue two abreast, when directed by any officer of the Council, and no person should take a place in the line out of proper order, or should enter the tramcar out of the order in which he stood. A penalty not exceeding 40s. was provided for.

### RECONSTRUCTION OF TRAMWAYS.

In regard to the reconstruction of the horse tramways in Ball's Pond Road, between Southgate Road and Kingsland Road, the Committee had been in communication with certain firms who had recently carried out construction and reconstruction for the Council. Messrs. Dick, Kerr and Company were prepared to undertake the tramways and street improvement works at the prices submitted on April last in their tender for the reconstruction of the horse lines from Highbury Station to City Road. The Committee were of opinion that the offer was a reasonable one, and that it should be accepted.

### GREENWICH POWER STATION.

The Committee had considered tenders for the provision of condensing water pipes to be laid in the bed of the River Thames at Greenwich power station. They had not yet been able to decide as to the tender which should be accepted, and they proposed that they should be authorised to deal with the tenders during the summer recess. It would be necessary to provide certain new switchgear in connection with the turbo-generators which were being obtained for the power station, as well as various protective devices of the existing switchgear. The Committee recommended that their chairman and vice-chairman be authorised during the summer recess to open any tenders received, and to accept the most favourable.

The Committee had considered tenders for the purchase of the undermentioned plant, the use of which was to be discontinued at Greenwich power station :—Two 3,500 kw. reciprocating engines and generators, and two 150 kw. Belliss engines and generators with condenser. They had accepted the highest tender received for the reciprocating engines, that of George Cohen and Sons, which was on the basis of the weights of the component metals. None of the tenders received for the Belliss engine was satisfactory.

### IMPROVEMENTS AT SUB-STATIONS.

In connection with the provision of rotary converters and static transformers at Shoreditch sub-station, the Committee proposed various arrangements for the carrying out of the work, providing for additional offices and foundations for the rotary converters. The expenditure was estimated at £2,510, and it was proposed that tenders for the execution of the building work should be invited, and that the chairman and vice-chairman of the Committee be authorised during the summer recess to accept the most favourable tender for the foundations.

The following tenders had been considered for the provision of certain additional switchgear for Shoreditch, Camberwell, and Woolwich sub-stations and the central car repair depôt :—

| | £ s. d. |
|---|---|
| Spagnoletti, Limited | 999 14 0 |
| Johnson and Phillips | 1,068 0 0 |
| Ferranti, Limited | 1,100 5 0 |
| Switchgear and Cowans | 1,140 18 6 |
| Eckstein, Heap and Co. | 1,330 15 0 |
| A. Reyrolle and Co. | 1,387 11 0 |

The estimate of the chief officer was £950. The Committee proposed that the tender of Spagnoletti, Limited, should be accepted.

### TROLLEY WIRE CONTRACT.

The Committee had considered the following tenders for the supply of five miles of 4/0 grooved trolley wire :—

| Names of Firms. | Price a Mile. |
|---|---|
| | £ s. d. |
| Thompson and Co. (providing for manufacture in France) | 87 15 0 |
| Frederick Smith and Co. (*accepted*) | 93 6 8* |
| | (81 13 4 a ton) |
| British Insulated and Helsby Cables | 94 0 0* |
| Thos. Bolton and Sons | 91 13 0 |

* Subject to discount of 2½ per cent.

The Committee had accepted the tender of Frederick Smith and Company.

### MOTOR CARS FOR THE TRAMWAY DEPARTMENT.

The Committee recommended that six motor cars be obtained for use in the tramway department, and that tenders be invited. These were to replace existing cars which had become obsolete, and whose up-keep and petrol and oil consumption were very expensive.

### MUNICIPAL TRAMWAYS ASSOCIATION.

The General Purposes Committee recommended that Mr. W. J. Squires and the chief officer of tramways represent the Council at the annual conference of the Municipal Tramways Association.

### MISCELLANEOUS.

Among minor matters the Committee reported that the Board of Trade had approved of the running of trailer cars between Nile Street and Abbey Wood, and between Beresford Square and Eltham for a further period to October 31.

In view of the amount of work in supervision of the manufacture of rails and special trackwork, it was proposed to employ an additional inspector up to March 31 next, at £4 4s. a week.

It was recommended that tenders be invited for the erection of the extension of Abbey Wood car shed. The completed shed would provide accommodation for 80 cars.

It was further proposed that a new cross-over should be constructed by the tramway department in Peckham Road at a cost of £650.

All the reports were adopted.

### THE REDUCTION OF RATES ON THE TRAMWAYS.

Mr. J. D. Gilbert asked the chairman of the Local Government Committee whether he could state (1) how many assessment appeals had been made against Borough Council valuations of tramway tracks for rating; (2) could he inform the Council if railway companies were also appealing against their local assessments on account of loss of revenue owing to motor 'bus competition;

Digitized by Google

(3) would not the effect of the Council's and railway companies' appeals, if successful, be to increase considerably the rates of Borough Councils; (4) was it possible to give the Council any illustration of what any one Borough Council would lose over reduction of tramway and railway rates, and what increase there would be owing to increased road charges?

Mr. E. L. Meinhertzhagen (chairman of the Committee) replied that no appeals had yet been lodged, but objections to the assessment of the Council's tramway lines had been served in 23 boroughs. He understood that at least one railway company was objecting to its assessments, on account of reduced revenue owing to motor 'bus and tramway competition. Any considerable reduction of assessment must necessarily result in an increase in the rate in the £. The loss would not fall eventually wholly upon the borough in which the reduction took place, but would be shared partly by the whole of London. There was one case which he hoped had been settled with a certain Borough Council, though it was not finally settled. The reduction in that case would probably involve an increase in the rates of the first year of less than one-third of a penny in the £, which would be reduced in subsequent years to about a farthing in the £.

## MISCELLANEOUS NEWS AND NOTES.

**More Cars Required at Wigan.**—Alderman Ashton, in moving the adoption of the report of the Tramways Committee, said that at the next meeting it was proposed to ask the Council to sanction the borrowing of money for the purpose of buying six up-to-date cars.

**Trailers on a London Circular Route.**—For two weeks past two trailer cars have been in successful operation on the Tooting, Westminster, and Blackfriars circular route during the workmen's morning traffic. The number will be increased as more of the converted horse cars become available.

**Northampton Development.**—A scheme has been arranged for the extension of the tramways to the Far Cotton suburb as soon as the work of reconstructing the South Bridge has been completed in the near future and Bridge Street has been widened. A parcels delivery system has been inaugurated in connection with the tramways by the manager, Mr. J. A. Gottschalk.

**Bradford's Rolling-Stock Requirements.**—For the year beginning April 1, 1914, the Tramways Committee propose to expend the following sums on rolling-stock: 50 trucks, £4,050; 100 motors, £10,600; 50 resistances, £412; 100 circuit-breakers, £215; 100 controllers, £2,400; 50 power brake sets, £2,500; 50 sets power circuits, £875; 10 car bodies rebuilding, £2,250, total £23,302, less £2,500 value of old equipment.

**Municipal Tramways Association.**—At the meeting of the London County Council on Tuesday last, Mr. W. J. Squires, chairman of the Highways Committee, and Mr. A. L. C. Fell, chief officer of tramways, were appointed to represent the Council at the conference of the Municipal Tramways Association, which will be held at Sheffield on September 24, 25, and 26. The Council, in appointing the representatives, did so on the understanding that it was thereby in no way committed as to its policy in regard to any matters discussed at the conference.

**Proposed Leeds Extensions.**—The Tramways Committee recommend eight extensions of the tramways and the following installations of the railless traction system:—From junction of Wellington Road and Tong Road, *viâ* Copley Hill, Wortley Lane, Mill Green, Sydenham Street, Domestic Street, Holbeck Moor Road, Lane End Place, Hunslet Hall Road, Moor Road, and Church Street to Low Road; from junction of Whitehall Road and Lawns Lane, *viâ* Lawns Lane and Chapel Lane, to a point in Chapel Lane near the Recreation Ground, 60 yards from Hall Lane.

**Coventry and Omnibuses.**—During the discussion on the first annual report of the Tramways Committee, Councillor Pridmore, the chairman, said the Committee had under consideration the question of an extension to Earlsdon, but he thought that first of all they would have to try motor omnibuses, which they could do quickly, but, from the Corporation point of view, they must take into consideration the wear and tear on the roads. Having regard to the congested centre of the town, he thought they should get a small fleet of six omnibuses, and run four regularly and keep two in reserve.

**The Birmingham Difficulty.**—Having reconsidered the proposal to construct tramways across Victoria Square and along Colmore Row, which was referred back to them by the Council, the Tramways Committee reported on July 29 that they can bring forward no feasible alternative to the scheme. They therefore advised that the length of line along Paradise Street be dropped. The Committee have powers already to link up the Suffolk Street line with Congreve Street by way of Easy Row and Great Charles Street, and the Committee will now ask that they be permitted to take the line from the bottom end of Broad Street, and turn to the left into Easy Row, joining the new through line in that thoroughfare.

**Improved Conditions for Dublin Employees.**—At a midnight meeting attended by the employees of the Dublin United Tramways Company on July 20, at the invitation of the chairman, Mr. W. M. Murphy, it was announced that the directors had decided to give an increase of one shilling a week to all the uniform men. Those who were in the first year's service, and who at present did not get a day's leave in twelve, would have a day's leave with pay from the time they started. This would make thirty days a year with pay for all the traffic staff, which Mr. Gordon, the chairman said, told him was more than was given by any other company. The secretary had also been instructed to give each man present half a day's pay for attendance at the meeting on account of losing some of their rest. Unlike railway companies, they could not raise the fares to recoup themselves, the chairman added; in fact, the demand was that they be reduced. They also had under consideration a scheme, which would be ready in a short time, of giving free pensions to every man who attained a certain age, and who had had a certain length of continuous service in the company. The men in the other departments had also been given increases in one way or another. The directors had not the slightest objection to the men joining a legitimate union of their own. Having spoken at length on the coercive methods adopted by strike organisers and the folly of strikes, the chairman said the directors recognised that owing to the increased cost of the necessaries of life, some increase should be given. An advance had been recently given to sundry men in the service, mostly without the asking.

**Private Bill Legislation.**—Morley Corporation Bill came before a House of Commons Committee on July 29, when sanction was given to a clause to enable an arrangement to be made with Leeds Corporation for the running of a railless trolley car service, the traffic not being sufficient to justify an extension of the tramways now existing. Leeds Council were stated to be prepared to run a service of railless cars which would be practically an extension of the Leeds system and would provide a tramway route from Morley to Bradford as well. Morley would take over the whole of the tramways in their area at the end of twenty-six years. It was intended that Morley should borrow the necessary money and that Leeds should pay the instalments of interest and sinking fund in return for the takings on the cars.

**Omnibus Traffic to Pay for Road Wear.**—The Local Legislation Committee of the House of Commons on July 23 approved of the Leicester Corporation Bill except a clause which sought to exclude racegoers from the ordinary passenger cars. Sanction was given to set apart special cars for racegoers and to charge special fares. Other clauses provide for extensions of the tramways, the doubling of existing single lines, and the running of motor omnibuses along Melton Road to Thurmaston, along Groby Road to Anstey, and along London Road to Oadby. The motor omnibus clause was opposed when before the House of Lords by the County Council, but an arrangement had been made with the County Council whereby for the first three years there should be a payment by the Corporation of three-eighths of a penny per car mile, and that after the expiration of that three years' experience there should be an agreement or arbitration respecting the additional cost involved for road maintenance through the running of the motor 'buses. The Corporation were to contribute to the County Council one-third of that expense.

**Bristol Tramways.**—Under section 43 of the Tramways Act of 1870, the Bristol Corporation have the option of purchasing the greater part of the tramways in the city, amounting to 25 miles out of a total length of 31 miles, on May 15, 1914. The Corporation, who are now considering the question of purchase, have found it necessary to obtain not only an estimate of the approximate value of the tramways but also of the probable results from the future working of the tramways either by municipal or private ownership. For this purpose the Corporation retained the services of Mr. J. B. Hamilton, general manager of Leeds Corporation tramways, and Mr. J. F. C. Snell, consulting engineer of the firm of Messrs. Preece, Cardew and Snell, and we understand that these gentlemen are at present completing a valuation of the tramways and preparing a report. When this has been received the Corporation will be in a position to decide whether they should go forward with a Bill in the next session of Parliament to secure powers to work the tramways. Whether they should exercise such powers, if obtained, or allow the company to continue to work the undertaking would, of course, not require to be determined immediately.

## CONTRACTS AND ORDERS.

**Chamberlain and Hookham, Limited,** have received a contract from Falkirk for A.C. meters.

**Bradford Council** have accepted the tender of Collier Bros., Limited, for the supply of 30 miles of copper trolley wire, at £2,668.

**Hillman Motor Car Company** have obtained a contract to supply a motor lorry to the electricity department of Willesden Urban Council.

**Huddersfield Council** have placed contracts with J. Proctor, Limited, for a coal elevator, and with J. Moody and Son for a hydraulic hoist.

**Aberdeen Council** have accepted tenders as follow:—For the clothing of the tramway employees for the next two years: Uniforms, Moore, Taggart, and Company, Glasgow; hats, Perry and Company, Halifax; inspectors' waterproofs, the London Rubber Company; motormen's waterproofs, Steele and Company, Aberdeen.

**London County Council** have accepted the following tenders:—Dick, Kerr and Company, reconstruction of horse tramways in Ball's Pond Road at rates contained in a previous tender; Spagnoletti, Limited, switchgear for Shoreditch, Camberwell, and Woolwich sub-stations and the central car repair depôt, £999 14s.; Frederick Smith and Company, five miles of 4/0 grooved trolley wire, £93 6s. 8d. per mile (or £81 13s. 4d. per ton), less 2½ per cent. discount.

**Johnson and Phillips, Limited,** have secured the following orders for their standard type oil-cooled transformers during the last few weeks:—Two 625 k.v.a., 6,600 v., for Dundee Corporation; two 150 k.v.a., 6,000 v., for Wigan Corporation; one 500 k.v.a.,

Digitized by Google

6,600 v., for Oldham Corporation; three 100 k.v.a., 2,000 v., for the Admiralty; fifty-one 50 k.v.a. and three 300 k.v.a., 13,200 v., for Canada; four 400 k.v.a., 10,000 v., for Japan; two 350 k.v.a., 6,000 v., for Brazil. The company have also secured contracts for upwards of 5,000 k.v.a. in transformers for English machinery makers in connection with converting plants, etc.

## PERSONAL.

**The late Mr. James Watts Courtenay** left estate of the gross value of £85,832; net personalty, £71,064.

**Mr. J. H. Cowell,** tramways manager to Blackburn Corporation, has been given an increase of his salary from £400 to £500 by yearly increments of £25.

**Mr. G. Webster's** salary as manager of the Rochdale tramways has been fixed at £350 per annum, rising in two years by annual increments of £25 to £400.

**Mr. J. S. D. Moffet,** the new tramways manager at West Ham, was on July 29 presented by the Rochdale tramwaymen with a silver entree bowl and two silver water jugs.

**Colonel Sir Arthur Yorke,** late chief inspecting officer of railways to the Board of Trade, has been appointed a director of the London, Chatham and Dover Railway, in the place of the late Mr. G. Wyndham, M.P.

**Mr. T. R. Smith,** chief electrical engineer at Leicester, has been granted an increase in his salary from £600 per annum to £700 as from January 1, 1913, to £800 from January 1, 1914, and to £900 from January 1, 1915.

**Mr. G. F. Upcott** has been appointed chief inspector of Walthamstow Council tramways, at a salary of £130, rising by annual increments of £10 to £160 per annum. Mr. Upcott is at present an inspector on the Leyton Council tramways, and was for a number of years employed by the old North Metropolitan Tramways Company. There were 102 applicants for the position.

**Bombay Tramways Officials.**—Sir Charles Ollivant, who presided at the annual meeting of Bombay Tramways and Electric Supply Company, remarked that the company were greatly indebted to the experience, ability, and zealous supervision of the managing director, Mr. Rimington, and no less fortunate in having had a chief engineer with the conspicuous professional attainments and business ability of Mr. Cooper. As the principal local representative of the company, his unfailing tact and courtesy had been appreciated by all, and, under the direction and influence of these leaders, a very efficient staff had been organised, whose excellent service merited warm approbation. It gave the directors great pleasure to see present one of the officials who had been associated with the undertaking from its commencement. He was highly appreciated by the managing director of the old horse tramway company, and had since been appreciated highly by Mr. Rimington, he referred to Mr. Pestonji Mahaluxmiwala. A dividend of one per cent. on the ordinary shares, free of English income-tax, was declared.

## FINANCIAL REPORTS AND MEETINGS.

**The City of Buenos Ayres Tramways Company (1904), Ltd.**—The directors have declared a dividend at the rate of 1s. 3d. per share for the three months ended June 30.

**The Bristol Tramways and Carriage Company, Ltd.**—The directors have declared an interim dividend at the rate of 4 per cent. per annum for the half-year ended June 30.

**Walter Scott, Limited.**—The directors recommend dividends for the half-year upon the ordinary shares at 7½ per cent. (10 per cent. for the year), and on the preference shares at the rate of 6 per cent. per annum.

**The British Electric Traction Company.**—The receipts of all the associated companies of the British Electric Traction Company for the week ended July 25 amounted to £54,678. Upon such of the lines as were working both last year and this year the receipts show an increase of £2,797 upon the week.

**Liverpool Overhead Railway.**—The directors have declared interim dividends at the rate of 5 per cent. per annum on the preference shares and 2½ per cent. per annum on the ordinary shares, for the half-year, against 2 per cent. per annum for the corresponding period last year.

**Millars' Timber and Trading Company.**—Presiding on July 28 at the annual meeting, Dr. White said the profit was £157,034, which with the amount brought forward made a total of £186,285. After paying debenture interest and putting £50,000 to depreciation reserve, there was a balance of £114,128, out of which they proposed to pay 5 per cent. on the ordinary shares, carrying forward £29,201. The volume of business and selling price of their hard wood had been well maintained, but the cost of production had increased. Outside the hardwood business they had done very well, and had acquired two subsidiary businesses. The saw mill plant in the Turkish beech forest near Salonika, though delayed by the war, would soon be at work.

## WEEKLY TRAFFIC RETURNS.

The official traffic returns of 67 of the principal undertakings of the United Kingdom for the week ended July 26 amounted to £254,891, or £13,178 more than in the corresponding week last year, while the track mileage was 2,712, or 52 more than for the corresponding week. The receipts were at the rate of £93 19s. 8d. per track mile, an increase of £3 2s. 4d. per mile as compared with last year.

## COPPER AND ALUMINIUM MARKET.

August 1, 1913.

Messrs. Henry R. Merton and Co., Ltd., 2, Metal Exchange Buildings, Leadenhall Avenue, E.C., supply the following quotations of prices per ton:—

THE

# Tramway & Railway World

Vol. XXXIV. No. 7. | LONDON, SATURDAY, AUGUST 9, 1913. | [Established in 1892.

ANNUAL SUBSCRIPTION (Postage Prepaid)—in the United Kingdom, 25s.; for all places abroad, 30s.

Including sixty-four issues, of which twelve are large illustrated numbers, printed on fine art paper.

## NOTICES.

All Communications and Advertisements for next Saturday's issue should be received not later than 3 p.m. on Friday.

Advertisements for the next issue of which proof is desired should reach us by the second post on Wednesday.

The Editorial and Publishing Offices of "The Tramway and Railway World" are at Amberley House, Norfolk Street, London, W.C.

Telegrams: "TRAMIGRO, LONDON."
Telephone; No. 2948 GERRARD.

## WEEKLY LIST OF TENDERS INVITED.

### CITY OF ABERDEEN.

ADVERTISING ON TRAMWAY CARS.

The Corporation of Aberdeen are prepared to receive tenders for the Advertising Rights on their tramways for a period of five years.

Form of tender, with printed conditions, and any further information required, may be obtained from the General Manager, Municipal Buildings, Aberdeen; and tenders, in a sealed envelope, endorsed "Advertising Contract," must be addressed and delivered not later than 12 o'clock noon on Tuesday, 19th August, to the undersigned.

R. STUART PILCHER,
General Manager.

Corporation Tramways Office,
Municipal Buildings, Aberdeen.
August 8, 1913.

### CITY OF BRADFORD.

TRAMWAYS DEPARTMENT.

TENDER FOR MACHINERY AND TIMBER.

The Bradford Corporation are prepared to receive tenders for the supply of Machinery and Timber, as follows:—

1. One 5-ton Electrically-operated Travelling Crane.
2. One Power-driven Punching and Shearing Machine, to punch up to 1in.×1in. and shear 5in.×1in. flat and 5in.×⅜in. angle.
3. One Semi-automatic Turning and Screwing Lathe, 3in. hole through spindle to screw from ¼in. to 1½in. Whitworth threads.
4. One Armature Banding Machine, to take 4ft. between centres and 15in. diameter.
5. Two Single Smiths' Hearths, Cast-iron, 42in.×42in., with large tue iron Trough and electrically-driven blowers and regulators.
   One Double Smiths' Hearth, 42in.×42in., with large tue iron trough and electrically-driven blowers and regulators.
6. One Tram Wheel heavy Turning Lathe, electrically-driven and capable of recontouring a pair of tyres 33½in. tread diameter in not more than 30 minutes from floor to floor.
7. Hydraulic Car-lifting Jacks, to drawings and specifications.
8. Timber for tramcar bodies.

Schedules and Conditions of Tender may be had on application at the Tramway Offices, 7, Hall Ings, Bradford, on payment of the sum of one guinea, which will be refunded on receipt of a *bonâ-fide* tender. (Cheques to be made payable to the order of the Bradford Corporation.)

The contracts will be let subject to the Fair Contracts Clauses of the Corporation.

Tenders, endorsed "Tender for Machinery, etc.," to be sent to me not later than Saturday, the 30th inst. The lowest or any tender will not necessarily be accepted.

FREDERICK STEVENS,
Town Clerk.

Town Hall, Bradford.
August 2, 1913.

### CORPORATION OF HAVERFORDWEST.

COAL.

Tenders are invited for the supply of about 2,000 tons of Double-Screened Gas Coal of the very best quality, to be delivered at the Haverfordwest Railway Station or at the Gasworks Quay, Haverfordwest, by water communication, in quantities as required by the Gas Manager, during the year commencing on September 1 next, for the Corporation of Haverfordwest.

Tenders by August 18.

Forms of tender and further particulars of

R. T. P. WILLIAMS,
Town Clerk.

Haverfordwest.
July 23, 1913.

### COUNTY BOROUGH OF HALIFAX.

The Tramways Committee of the Halifax Corporation invite tenders for the supply and delivery at Halifax of 200 tons of Girder Tram Rails, B.S.S. No. 4 (60 feet lengths), and 7 tons of Fishplates, all to be manufactured according to the British Standard Specification, and to include the Drilling of necessary holes for Bonds, Anchors, Tiebars, etc.

Firms tendering must state where the material will be manufactured.

Any further particulars may be obtained from Mr. James Lord, M.I.C.E., Borough Engineer, Town Hall, Halifax.

Tenders, endorsed "Tram Rails," must be sent to the undersigned on or before Tuesday, August 19, 1913.

The person whose tender is accepted will be required to observe the fair contracts clauses adopted by the Corporation.

The Committee do not bind themselves to accept the lowest or any tender.

By order, PERCY SAUNDERS,
Town Clerk.

Town Hall, Halifax.
August 2, 1913.

### ROYAL BURGH OF KIRKCALDY.

ADVERTISING ON TRAMWAYS.

The Town Council invite tenders for the Sole Right of Advertising on their 22 Electric Tramcars for a period of five years.

Specification and form of tender may be obtained on application to O. F. Francis, M.I.E.E., Burgh Electrical Engineer and Tramways Manager, Electricity Works, Kirkcaldy.

Sealed tenders, endorsed "Advertising on Tramcars," addressed to the undersigned, must be delivered by post not later than Monday, August 25, 1913.

The Council do not bind themselves to accept the highest or any tender.

W. L. MACINDOE.
Town Clerk.

August 8, 1913.

### WIMBLEDON.

The Corporation of Wimbledon invite tenders for the supply, delivery, and erection of the following plant at their Electricity Works, Durnsford Road, Wimbledon, namely:—

(*a*) A 1500 kilowatt Turbine-Alternator, with Condensing Plant and Auxiliaries.

(*b*) A 20-ton Overhead Travelling Crane.

Specifications, General Conditions, and Forms of Tender may be obtained from Mr. H. Tomlinson-Lee, Borough Electrical Engineer, Electricity Works, Durnsford Road, Wimbledon, on payment of a deposit of £2 2s. for each copy required, such deposit being repayable on receipt of a *bonâ-fide* tender.

Sealed tenders, in the envelopes provided, are to be addressed to the Chairman of the Electricity Committee, and delivered at the Electricity Works, Wimbledon, not later than 5 p.m. on Monday, the 1st day of September, 1913.

The Corporation do not bind themselves to accept the lowest or any tender.

A. STEELE SHELDON,
Town Clerk.

Town Clerk's Offices, Wimbledon.
August 6, 1913.

## LIVERPOOL CORPORATION TRAMWAYS.

### ADVERTISING ON TRAMWAY CARS.

The Tramways and Electric Power and Lighting Committee are prepared to receive tenders for the exclusive right to Advertise upon the Tramway Cars for a period of seven years, commencing on the 1st August, 1914.

The number of cars, working and spare, excluding first-class cars, is 496, and the total length of line traversed 119 miles. The total mileage of the cars during 1912 amounted to 12,506,408, and the number of passengers to 134,249,967. The total resident population in the districts served by the Corporation tramway cars amounts to approximately 838,000.

Tenders must be enclosed in the envelope provided, and addressed to the "Town Clerk, Municipal Buildings, Liverpool," and forwarded through the post so as to be received by him not later than the first postal delivery on Wednesday, the 13th August, 1913.

Form of tender and specification may be obtained upon written application to C. W. Mallins, Esq., A.I.E.E., General Manager, Tramways Department, Central Offices, 24, Hatton Garden, Liverpool.

Edward R. Pickmere,
Town Clerk.

Municipal Buildings, Liverpool,
July 21, 1913.

## FOR SALE.

### PATENTS FOR SALE.

THE PROPRIETORS OF BRITISH PATENT No. 21703 of 1910 for "Improvements in and relating to Railway Rail Joints," desire to grant manufacturing licenses or to make other arrangements on reasonable terms for the purpose of working the invention in this country.

For full particulars apply Mathys and Co., Chartered Patent Agents, 43, Chancery Lane, W.C.

THE OWNER OF BRITISH PATENT, No. 19462 of 1906, entitled "Improvements in Destination Indicators for Tramway Cars," is desirous of disposing of the patent or entering into working arrangements under license or otherwise with firms likely to be interested in the same.

A copy of the patent specification and full particulars can be obtained from and offers made (for transmission to the owner) to Marks and Clerk, 57 and 58, Lincoln's Inn Fields, London, W.C.

## RAILLESS TRACTION DEVELOPMENT.

The session of Parliament which is now about to close has been notable for the passing of a considerable number of Bills authorising the use of the railless trolley system of electric cars, both by companies and by local authorities in various parts of England. These, with the schemes sanctioned in previous years, will, when equipment is complete, constitute a very considerable mileage of roads and streets upon which the railless cars will run. The questionable feature about the action of Parliamentary Committees on these Bills has been the imposition (often by agreement reached under pressure) of a charge on the promoters for road maintenance. It is admitted that general legislation is necessary on the question of road maintenance, both as regards railless electric cars and as regards motor omnibuses. The arrangements come to in connection with Bills of the present session can accordingly be looked on only as temporary. The activity in developing the railless system in this country promises to continue, and already proposals for Bills for next session are being considered. Among other places Leeds is working out a large scheme for the extension of the existing trolley routes, which have already given much satisfaction. Another line of advance is indicated at Brighton, where the Corporation, in furtherance of the powers already obtained, are negotiating with the Board of Trade for permission to use double-deck cars. Hence tenders for the vehicles have not yet been invited. There is no reason why a double-deck railless trolley car should be more liable to capsize than a double-deck motor omnibus, so that it is hard to see why there should be any difficulty in getting the desired permission. In countries abroad the system is developing. Towns and districts in the British dominions where there is not sufficient population to warrant the construction of tramways are taking up the railless scheme with avidity. This appears to be particularly so in the Transvaal, and Bloemfontein is among the places which are going ahead in this matter. Perhaps the most interesting fact is that in the United States, the home of the street railway, the trackless system is being tried. A route of this kind is now in operation at Merrill, Wisconsin, where the railless cars act as feeders to existing tramways. The fact that the system has been installed is an indication of the great improvement which has been made in American roads. The street railway first came into existence largely because the streets and roads in America were execrable—as, indeed, they generally are in "new" countries. But increasing population and the lapse of time have brought about improvements in American roads, and apparently we may now look for large developments of the railless system in suburban and semi-rural districts in America. Many American towns are widely and thinly spread out, especially in their suburbs, and this desirable feature, largely due to the existence of street railways, should be further emphasised by the use of the trackless system. It can be easily and cheaply spread out into sparsely populated districts, and with rapid growth of population it readily lends itself to conversion into tramways as soon as that becomes desirable. Though the routes of the cars cannot be varied at will, like those of the motor omnibus, the system presents the double attraction of lower working expenses and of being maintainable by the same staff and with the same sort of apparatus as are required for the already existing tramways.

## PAY-AS-YOU-ENTER CARS AT ABERDEEN.

Mr. R. Stuart Pilcher general manager of the Aberdeen Corporation Tramways, in his annual report states that the Town Council inaugurated the "Pay-As-You-Enter" principle on April 28, 1913, on the Woodside section of the system. Six new cars were built, and four altered and made suitable for the operation of this system of fare collection, making a total of ten cars. This system of fare collection has several outstanding advantages over the other system, the chief of which are that, by the conductor always being on the rear platform, numerous accidents to persons boarding and alighting from the cars are prevented, and the conductor is always in a position to see intending passengers, whilst the department is able to collect all the fares. These cars have been in service for some time now, and the public have become accustomed to them. There is no congestion or delay through the prepayment of fares. The passengers have accommodated themselves to the system and have their fares ready, whilst there have been no rear platform accidents. The receipts have gone steadily up, and although there is a natural increase taking place on this route, there is a large part of the increase in receipts due to the prepayment of fares. It is well known that under the usual method of collecting fares there is a considerable leakage, due mainly to the inability of the conductor to attend to his numerous duties and to collect all the fares.

## COMPARATIVE CHARGES ON CARS AND OMNIBUSES.

West Ham Borough Council is supporting the Croydon Corporation in its application to the Government, urging the necessity of legislation which would equalise the burdens on motor omnibuses and tramway cars. East Ham is another district which is feeling severely the effect of the present unfair conditions. The total payments made by the tramways in Croydon for road maintenance, rates, etc., amount to £139 per car per annum, while the motor omnibuses contribute only £49, of which all but £6 is due to the petrol tax. In East Ham the corresponding figures are £188 and £49, the annual totals being made up as follow:—

| | Tramway Car. | Motor Omnibus. |
|---|---|---|
| Maintenance of Roads ... | £130 0 0 ... | — |
| Rates and Taxes ... ... | 55 2 6 ... | — |
| Licence Duties ... ... | 2 15 0 ... | £5 18 0 |
| Petrol Tax ... ... ... | — | 43 0 0 |
| Totals | £187 17 6 | £48 18 0 |

In addition to the amounts mentioned, the charge on the Corporation cars for capital repayment amounts to £120 each per annum, so that the total charges on the rolling stock amounts to £308 per car.

## MOTOR TRAFFIC COMMITTEE.

The Select Committee of the House of Commons on motor traffic met on several days this week to consider the draft report submitted by the chairman, Sir George Toulmin, M.P. The report, it is stated, consists of some 50 pages, summarises the large body of evidence laid before the Committee, and makes various recommendations. It is expected that the report will be completed and adopted in a few days, and that it will be issued before the close of the Parliamentary session. Forecasts of the principal recommendations indicate that the Committee will strongly recommend the appointment of a central Traffic Authority, the formation of which, it will be recalled, was urged by the Royal Commission on London Traffic of 1905. In view of the increasing number of fatal accidents due to the motor omnibus it is felt that the Committee must make some recommendations which will tend to increase the safety with which these vehicles are now worked.

## HOBART MUNICIPAL TRAMWAYS.

The Hobart (Tasmania) tramway system, which was taken over by the City Council on July 1, was constructed by Messrs. Siemens Brothers and Company, and was described in the *Tramway and Railway World* of January, 1895. The present manager, Mr. A. C. Parker, went out as the representative of Messrs. Siemens Brothers, and under his supervision the first cars started running in November, 1893. In the following year the undertaking was handed over to the Hobart Electric Tramway Company. The service was begun with about 20 cars, of which 10 are still in service. The power station equipment has been extended, and during the last four years two 300 kw. sets have been installed, with one of the latest Babcock and Wilcox tubular boilers, with automatic stoking appliances. During the whole of the 20 years that the line has been in operation only one fatal accident has occurred, a record which probably has not been equalled in the history of electric tramways.

## ENGINEERING APPOINTMENTS ON THE ROAD BOARD.

The Road Board have appointed Mr. Henry Percy Maybury, M.Inst. C.E., the county surveyor of Kent, as chief engineer to the Board. Colonel Crompton, C.B., will continue to act, as he has hitherto done, as consulting engineer. Mr. Maybury will commence his new duties as soon as the Kent County Council fill the vacancy in the post of county surveyor, which will probably be in the month of November next. The Road Board have also added to their engineering advisory committee Mr. E. Parnell Hooley, the county surveyor of Notts, and Mr. Alfred Dryland, the county surveyor of Surrey.

## NEW AND PROSPECTIVE WORK.

CALCUTTA.—In reply to a request by Calcutta Council for extension to the tramways in five directions in the southern part of the city, the Tramways Company have stated they understand that the Calcutta Improvement Trust have under consideration several schemes for the widening of the existing, and opening out of new roads and are dealing with the question of the future expansion of the city generally. The company suggested that the proposals of the Corporation should be referred to the trust for an expression of opinion as to the advisability of constructing the tramway extensions referred to. The Council resolved to press the proposals upon the attention of the Improvement Trust in view of the provisions in their Act enabling them to subsidise tramway companies.

CARDIFF.—It is recommended by the Tramways Committee that the line between Kelom Road and Roath Park be doubled at a cost of £2,940, and the city engineer has been instructed to report on the cost of doubling the remaining length of line.

DUNFERMLINE.—The magistrates recommend the Town Council to accept a modified payment of £60 per mile for the maintenance of the Dunfermline and District Tramways Company's lines in the city for five years upon the condition that the proposed extension to Milesmark fails to pay.

THE IPSWICH (QUEENSLAND) IRON AND COKE COMPANY propose to instal electric tramways, and to erect a power house at West Ipswich to supply current for liyhting and power purposes to private consumers.

KILKENNY.—Borings and excavations for the testing of the coal field in the county of Kilkenny not having borne out the anticipations of the geologists, the scheme for a broad gauge railway from Castlecomer to Kilkenny has given place to a proposal for the construction of a light railway instead at an estimated cost of £40,000, including rolling stock. At the suggestion of the county surveyor, the line is to be laid alongside the public road, taking 4ft. off the present width of 26ft., the rails to be protected by a kerbing raised from six to nine inches on each side. At crossings the track is to be paved, and level girder tramway rails with suitable grooves are to be laid. The County Council have sanctioned the scheme. Mr. Ryan is the engineer.

WELLINGTON.—The Tramways Department's estimates for the current year provide for an expenditure of 34,800 on new works, including £9,264 for new cars, £5,020 for a new boiler and other plant for the power station, and £5,164 for car shed extension.

## MISCELLANEOUS NEWS AND NOTES.

**Brighton Tramways Committee** have decided to spend about £5,000 in renewing the track in London Road.

**No Free Passes.**—Brighton Tramways Committee have declined to grant free tramway passes to members of the Council.

**Permanent Way Labourers.**—The rates of wages of permanent way labourers on the Glasgow tramways has been fixed at 6d. per hour. This involves a small increase for about 5 per cent. of the men.

**Request for Departure Indicators.**—Stoke-on-Trent Council have requested the Tramway Company to provide the necessary apparatus at the termini for automatically indicating the times of departure of the cars.

**Track on Wooden Sleepers.**—The borough engineer of Bolton has been instructed to arrange for an experiment with the construction of track on wooden sleepers fixed transversely. A length of about 200 yards will be laid down.

**Railless Traction in the United States.**—The first railless traction installation in the United States has recently been completed at Merrill, Wisconsin. The line is a little over a mile long, and is to serve as a feeder to the tramway system.

**Traffic Inducement.**—Devonport and District Tramways Company are advertising a ten-mile ride through rural scenery for fivepence. For sixpence the Portsea Tramways Company give a ride of ten miles, the cars passing through attractive country.

**Motor Omnibuses on Bank Holiday.**—No fewer than 3,000 omnibuses were run by the London General Omnibus Company on Bank Holiday, and it is estimated that, in the aggregate, not less than 2,000,000 persons used them during the day.

**Fares Collection at Liverpool.**—Although the trial period of three months which was given to the pay-as-you-enter system on the Walton tram route has not elapsed, the old method of collecting the fares after the passenger is seated has been resorted to. The cars are not specially fitted for the prepayment system.

**Leeds Railless Trolley Extensions.**—The Leeds Sub-Tramways and Electricity Extension Committee has recommended that application should be made for power to carry out a number of tramway and railless trolley route extensions. The estimated cost of these is £190,000.

**Accumulator Traction.**—The Australian "Mining and Engineering Review" states that the Townsville, Queensland, Council has granted Messrs. Minham and Sons an extension for six months of the option for their scheme of electrical tramways on the electric accumulator system.

**Tramways and Kingston Bridge Widening.**—Surrey County Council were informed on July 29 that the London United Tramways Company had paid their contribution of £10,000 towards the cost of widening Kingston-on-Thames Bridge. The work is making good progress.

**Interrupted Service in Fifeshire.**—The service of cars on the Dunfermline and District Tramways was interrupted for several hours on Monday owing to the breakdown of a turbo-generator in the station of the Fife Electric Power Company, who supply the tramways with electricity.

**Motor Omnibuses in Wales.**—At a meeting of the Penybont Council recently, it was decided, on the recommendation of a conference of local Councils which had considered the question of railway facilities in the district, to invite motor-'bus companies to establish a motor service.

**London Employees and Superannuation.**—Without the intervention of a trade union the South London tramwaymen employed by the County Council are asking for the institution of a superannuation fund. They also ask for their position to be made more secure as they are considered to be daily servants, although their wages are paid weekly.

**Nottingham District Tramways.**—The Nottingham and Derbyshire Tramways new line from Langley Mill to Cinder Hill, a portion of the line from Ripley to Nottingham, was successfully run over on Monday. The whole of the new line, from Cinder Hill to Ripley, will be 12 miles in length, and it will be linked up with Nottingham Corporation tramways. The generating station is at Ilkeston.

**Motor 'Bus Accident at Hertford.**—A motor omnibus conveying a private party from Cambridge to Waltham Cross on Saturday night last was overturned, three men being killed and twenty-six injured. The omnibus was descending a hill at Amwell, about mid-way between Ware and Hoddesden, when all the passengers were thrown to the ground. Only the motorman and guard escaped injury. The former stated that the accident was due to his having attempted to avoid a careless cyclist.

**Penalty for Catching Hold of a Tramcar.**—A cyclist was summoned at Lambeth for catching hold of the side of a tramcar ascending Dog Kennel Hill, East Dulwich. A police constable informed him that one section of the Police Act, 1839, provided that any person who caused himself to be carried or drawn by any carriage within the Metropolitan police district without the consent of the driver was liable to a fine of not more than 5s. Mr de Grey dismissed the summons on defendant paying costs.

**Portsmouth Tramway Extension.**—The new extension from South Parade Pier, through St. Helen's Parade and Festing Road, to Highland Road, Eastney, forms an important link in the local tramway system. It was opened on July 31 by the Mayor, Alderman J. H. Corke, J.P., who drove a car over the new section. The Mayor was accompanied by members of the Tramways Committee and various officials of the Corporation, including Mr. V. B. Lironi, electrical engineer, and Mr. W. R. Spaven, general manager.

Digitized by Google

**Opening of a York Extension.**—Colonel von Donop, chief inspecting officer of the Board of Trade, on July 30 inspected the tramways extension from Blossom Street to South Bank, and the new line was put into service later in the day. The new route, which is little more than a mile in length, will serve the populous districts of South Bank and Bishopthorpe Road, and will provide a new route to the racecourse.

**The Punishment of "Joy" Riders.**—The Divisional Court of the King's Bench have dismissed an appeal by the father of a lad named Radley against a decision in favour of the London County Council at Westminster County Court. A car conductor mistook Radley for one of the boys who annoyed him by "joy" riding on the car, and cuffed him. The boy fell, and it was stated that the conductor fell on him and broke the boy's arm. A claim was made, and the County Court judge held that the conductor was not acting within the scope of his employment, and non-suited plaintiff.

**London Tramway Stoppage.**—The London County Council tramway system was seriously disorganised on August 1, owing to a mishap to a steam lorry in Kennington Park Road. About 8 p.m. a lorry and trailer were crossing the lines between the "Horns," in Kennington Gate when the steering gear broke and one of the front wheels came off. The vehicle eventually blocked the tramway lines and hundreds of cars in the Clapham, Brixton and Kennington Roads were brought to a standstill, the congestion extending as far as the Elephant and Castle. Cars were despatched by round-about routes, but it was an hour before the lines were clear.

**Western Valleys Railless Traction.**—The Unopposed Bills Committee of the House of Lords on Wednesday passed the Western Valleys (Monmouthshire) Railless Traction Bill. One awkward point was solved by the Committee. The local authorities are given power to purchase the undertaking at some future date, and the routes will pass through the districts of three local authorities. The three must agree to buy before a purchase can take place, and the promoters were afraid that they would be involved in three arbitrations for fixing the price. The Committee inserted a provision in the Bill to the effect that there should be only one arbitration.

**Illuminated Car at Oldham.**—Mr. J. W. Dugdale, general manager of the Corporation tramways, made application last week to the Electricity Committee for the free supply of current used by the illuminated car which was run on the occasion of the recent royal visit. The cost of the current was £8 7s. 9d., and it was pointed out that the Tramways Committee had spent a large sum on the equipment of the car. Considerable opposition was raised to the proposal, as some of the Electricity Committee considered that the Tramway Committee made money out of the special car by charging higher fares for a journey in the car which followed it. Eventually the application was granted.

**Southend Tramway Extension.**—Major Pringle, on behalf of the Board of Trade, on July 30, inspected and passed the first portion of the new boulevard tramway route at Southend. This portion is three-quarters of a mile long. The whole scheme embraces a mile and three-quarters, and gives access to the Thorpe Bay area, which is being rapidly developed. The total cost of the scheme is about £30,000, half of which is required for road making. A roadway 100ft. wide is being cut through from Southchurch to Thorpe Bay, and in the centre of this road 16ft. are set apart for the tramway tracks. The tracks will be laid on Jarrah wood sleepers, and on each side there will be a bed of shrubs and trees. The work is expected to be completed by next spring.

**Edinburgh Tramway Strike.**—It is estimated that the company lost about £10,000 in receipts during the recent strike, which continued for twelve days, and which, as reported in our last issue, was settled on July 31, as a result of a conference presided over by the Lord Provost. The *Edinburgh Evening Despatch* observes that it is satisfactory that the "settlement was arrived at without the meddling interference of busybodies, who would eagerly make use of such an unfortunate dispute in order to make personal or political capital." The *Scotsman*, in an editorial on the conclusion of the strike, expresses the hope that its moral—the "superiority of peaceful discussion and negotiation over the violent methods of the demagogue and the agitator—will not be lost on the working classes of this and other centres of population."

**Double-Deck Railless Car for Brighton.**—Brighton Council have informed Hove Corporation that a double-deck trolley car has been officially submitted to the Board of Trade for use on the under-running railless trolley system to be installed in Brighton. The communication adds that the Council do not assent to the view that a double-deck car is essential to the success of the scheme. The Hove General Purposes Committee have referred the letter to the Traction Committee with instructions to consider the system of overhead equipment submitted therewith, and report thereon, particularly as to whether such system is that most adapted for use in Hove and with double-deck cars; with power to take expert advice and view any systems at work. No official communication has been received from the Board of Trade with respect to the use of double deck railless cars which the Brighton Tramways Committee desire to adopt for their railless service. It was expected that the agenda for the Brighton Corporation's meeting for July would contain an intimation that tenders would be invited for the construction of the line on the Preston route, but these were withheld owing to the absence of any authority for the use of the double deck omnibus. It is understood that the Corporation is anxious to proceed with the work, and that this has been repeatedly intimated to the Board of Trade.

**Municipal Tramway Authorities' Influence in Parliament.**—In a report presented to the London County Council on July 22 the Parliamentary Committee refer to the deletion of clauses inserted in the Council's Bill by a Committee of the House of Commons, giving compulsory running powers to the London United Tramways Company over certain lines to be purchased by the Council. The Committee add:—"We feel that the success which has attended the Council's action in this matter is very largely due to the efforts of the members who spoke on behalf of the Council. Valuable assistance was also rendered by many of the local authorities owning tramway undertakings throughout the country." The report also takes note of Sir Ivor Herbert, the chairman of the Select Committee, withdrawing his opposition to the deletion, as it would leave the way open for fresh consideration and a chance of a satisfactory settlement.

**The Leeds Manager to Assist Bristol.**—When the minutes of the Tramways and Electricity Committee were submitted to the Leeds City Council last week, it was recorded that the chairman, Alderman C. F. Tetley, had given permission to the general manager, Mr. J. B. Hamilton, to render assistance to the Corporation of Bristol in connection with the projected purchase of tramways. One of the members desired to ask a question, but Alderman Tetley said that this was a matter entirely within his sphere. He had given the permission, and he maintained that it was not a part of the Council's duty to discuss it. The Lord Mayor thereupon ruled the question out of order. The Town Clerk said that the same subject was brought up two months ago, and the Lord Mayor then ruled the discussion out of order. On referring again to the agreement entered into between the Corporation and Mr. Hamilton, the Town Clerk now said that the Lord Mayor was quite right.

**Extraordinary Traffic at Manchester.**—The number of tramway passengers in Manchester on the occasion of the recent royal visit amounted to 825,703, the receipts constituting a record, with the exception of August 3, 1908. On that Bank Holiday the receipts were £4,144, and the passengers 698,013. Mr. J. M. McElroy, the general manager, has explained that the reason why the receipts were lower, although the number of passengers was higher, is due to the fact that there had been considerable reduction in the fares throughout the service, and consequently more passengers have to be carried to secure the same receipts. The figures for Monday, July 14, when the King visited Manchester, are the more remarkable, because for several hours during that day traffic in the centre of the city was stopped entirely, and 110 cars were engaged in carrying school children to special stands. The number carried on that day was more than the entire population of Manchester, which, according to the last census return, was 714,333.

**New Electrical Station at Glasgow.**—At the last meeting of the City Council it was decided to authorise the engineer of the electrical department and a member of the committee to visit the United States and Canada for the purpose of inspecting the largest electrical installations in operation there. The visit was considered advisable in view of the necessity for providing a new electrical generating station for the city. Bailie Smith, of the Electricity Committee, said that they had a big problem in hand, and they were acting on the principle that a thing well begun was half done. They had bought the best piece of ground for the purpose in the whole city at a price one fourth less than was paid for either of the two stations belonging to this Corporation. One of the greatest electrical authorities, Dr. Ferranti, had advised them before they did anything in Glasgow to visit America. Those responsible for the spending of over a quarter of a million wanted to learn every detail in which they could economise. Bailie Smith said that no consulting engineer would be employed on the new station; their new staff were quite capable of acting as consulting engineers.

**Unremunerative Fares in London.**—One of the provisions of the Bill which the London County Council have promoted in Parliament would have allowed them to charge up to a maximum of one penny per mile over their whole system, and any fraction of a mile may be deemed a mile. Giving evidence in support of the proposal, Mr. Fell, chief officer of the tramways, stated that if the Council got the power they sought, they did not propose to charge the maximum fares. They were now the cheapest carriers in the London area, and they had halfpenny fares and very cheap workmen's fares on all their sections. As an example of this, he gave the instance of a 19-mile ride for twopence from Tooting to Hop Exchange and back. When the Bill was before the Select Committee of the House of Lords, it was pointed out that in the districts of Acton, Chiswick and Shepherd's Bush passengers could now ride from 3½ to 5 miles for a penny, and the Council's proposal might interfere with the through running on the London County Council lines and the London United Tramways. Ultimately, it was announced that an agreement had been arrived at, under which the existing rates would not be altered, and the Committee decided that it might proceed.

**Contract and Transfer Tickets.**—Mr. C. W. Mallins, general manager, Liverpool Corporation tramways, has reported to the Committee that he had communicated with the principal tramways undertakings regarding the use of contract tickets, but he found that none of the 84 from which replies were received, with three exceptions, issues them. All consider that such tickets are impracticable owing to the difficulty, if not impossibility, of appraising the correct value of a contract on any large tramway system, and, further, the impossibility of effectually preventing fraud and abuse. Mr. Mallins is only aware of three undertakings where contracts have been introduced—Southport, Blackpool, and Aberdeen. At Southport the Corporation found it necessary to discontinue the use of contracts at the end of last year owing to

Digitized by Google

the manner in which they were abused, and the consequent serious financial loss, while in the case of Blackpool it was estimated that the Corporation was losing £1,500 per annum. Out of 84 tramway authorities communicated with 48 issue no transfer tickets, considering that to do so would open the door to various kinds of abuse; 24 issue transfer tickets, but cannot recommend their adoption, owing to the fact that they lend themselves to all kinds of fraud; seven see no objection to the use of transfer tickets, while five others issue them on a very limited scale. With reference to the question of cheap fares for children there is no uniform practice adopted by the various tramways authorities; each authority seemed to arrange its fare in accordance with local conditions.

**Theft by Bogus Tramwayman.**—An audacious robbery was committed in Leeds early on August 2, when a box containing £60 in gold, silver, and copper was taken from an employée of the City tramways. The employee had left the Chapeltown depôt shortly after 7 o'clock with the box, and on arriving at City Square proceeded to the tramway offices. According to accounts in local newspapers, when the tramway man reached the middle of the roadway, another young man, wearing the cap of a tramway employée, hurried up to him and remarked in a matter-of-fact way, "You have to go back to the depôt for some boxes. Be quick; they're waiting for you. I'll take this bag to the office." The employée had not the slightest suspicion that the man was not connected with the tramways department, and he handed the bag over without a word and at once set off back to Chapeltown. The thief walked coolly towards the tramway offices, but instead of entering, turned up a side street off Infirmary Street and without waiting to get further afield ripped the thick leather bag open with a sharp knife or a razor, and proceeded to sort out the contents. He appears to have picked out only the gold coins, discarding the heavier silver and copper as being likely to jeopardise his chances of escape. He obtained £20 in gold and then cleared off, leaving £40 in silver and copper still in the bag, which he threw into the roadway. The whole of this amount, together with the damaged bag, was subsequently recovered by the tramways department. The robbery was only discovered when the man in charge of the money arrived at Chapeltown and learned to his amazement that no message had been sent for him and that he was not wanted. It then occurred to him that he might have been the victim of a theft, and he returned with all speed to the offices in the city and made his story known. The police were immediately informed, but the man was not captured.

## CONTRACTS AND ORDERS.

**Mr. G. F. Tomlinson** has received a contract for doubling tramways at Derby, at £2,632.

**Bayliss, Jones and Bayliss, Ltd.,** have an order for tie-bars from Salford Corporation tramways.

**The Electric Construction Company, Ltd.,** have received an order for a booster from Bolton Corporation.

**Walter Scott, Ltd.,** are supplying steel rails and fishplates for re-laying the track in Manchester Road, Bolton.

**Doncaster Tramways Committee** have accepted the tender of Arnold and Son, at £2,524, for extending the car shed.

**The United Electric Car Company, Ltd.,** have received an order for two top deck covers for tramcars from Lancaster Tramways Committee.

**Crompton and Company, Ltd.,** are supplying a direct current switchboard at Salusbury Road sub-station for the Willesden District Council.

**The Belfast Tramways and Electricity Committee** has accepted the tender of Bertram Thomas, of Manchester, for a switchboard panel for the electricity works.

**Burnley Corporation Electricity Committee** have accepted the tender of the British Westinghouse Electric and Manufacturing Company for a turbo-alternator, rotary converters, switchgear, etc., at £12,860.

**The British Insulated and Helsby Cables, Ltd.,** have a contract from Burnley Corporation for the supply of cables. They are also supplying 6,000 volt overhead three-phase line to Halifax Corporation.

**Bradford City Council** has accepted the following tenders as extensions of, and at the same prices as, existing contracts:—Siemens Brothers Dynamo Works, Ltd., 100 tramway motors, 50 resistance sets, and 100 circuit breakers; Dick, Kerr and Company, Ltd., 100 D.B. form K4 tramway controllers; Hurst, Nelson and Company, Ltd., 50 tramway trucks; Cole, Marchant and Morley, 50 power brake sets; Collier Brothers, 30 miles 0000 grooved copper trolley wire.

## PERSONAL.

**Lord Montagu of Beaulieu** has been appointed a member of the Road Board in place of the late Sir Charles Rose.

**Mr. H. F. Ellis,** electrical engineer, of South Shields, has been granted an increase in salary of £50, to £450 per annum.

**Mr. J. W. Dawson,** city surveyor of Bradford, has been voted an increase in salary of £100, and a further addition of £50 next year.

**Mr. J. H. Cowell,** general manager of the Blackburn Corporation Tramways, has been voted by the General Purposes Committee an increase of salary from £400 to £500 by four annual increases of £25.

**Mr. R. S. Pilcher,** general manager and engineer of Aberdeen Corporation Tramways, was, at a meeting of the Town Council on Monday, granted an increase of salary from £400 to £450, with further annual increases of £25 to £500.

**Mr. James Dalrymple,** general manager of the Glasgow Corporation Tramways, and Mr. Thomas Nisbet, master of works, sail for New York to-day by the Anchor liner *Camerenia,* with the object of studying American tramway methods.

**Mr. L. C. F. Bellamy,** borough electrical engineer and tramways manager of Ilkeston, has been presented by the employées of the tramways and electricity departments with a pair of handsome copper curbs and fire appliances, on the occasion of his marriage.

**Mr. J. W. Cockrill,** borough engineer, Great Yarmouth, was presented with a silver bowl during the recent conference of the Institution of Municipal and County Engineers in that town by the members of the Corporation and his brother officers in recognition of his election as President of the Institution.

**Mr. George Webster,** who has been appointed general manager of the Rochdale Corporation Tramways, will receive a salary of £350 per annum, rising by two annual increases of £25 to £400. Mr. F. Ogden has been appointed chief clerk, Mr. Richard Bentley chief traffic assistant, Mr. Sidgwick rolling stock superintendent, and Mr. George Philipson overhead equipment superintendent.

**Mr. G. M. O. Scott,** who was selected by the directors of the Ceará Tramway, Light, and Power Company as general manager, is now in Ceará acting as manager for the existing mule tramways during the construction of the new undertaking. He is also employed by the contractors in connection with the latter work, in order to preserve as far as possible, continuity in the technical and business management of the company. It was reported by Mr. C. Hunt, who presided at the annual meeting, that the works were proceeding satisfactorily, and that indications were that the receipts would be much more than was originally anticipated by the consulting engineers.

**Mr. T. B. Goodyer,** general manager, Croydon Corporation tramways, has on several occasions received commendation for the work he has accomplished for the tramway undertaking against the competition of the motor omnibuses. In 1909-10 the latter vehicles were inferior to those now in use, and on the London tramways being extended to the Croydon boundary the omnibuses gave up the fight. Now the vehicles of the London General Omnibus Company, the British and M.E.T. Companies are working the main London and Croydon route under the direction of the first-named, while from East London the petrol-electric vehicles of Thos. Tilling, Limited, make further competition for the tramways. Councillor Denning, chairman of the Tramways Committee, in moving the adoption of the manager's report for the year 1912-13 at the July meeting of the Council, remarked that Mr. Goodyer started the document by saying he had great pleasure in submitting the annual report. Mr. Goodyer might have said he had pleasure and pride in submitting it. The report did him very great credit. He doubted if a more exhaustive or a more reasonable report, dealing with the matter from every point of view, had been presented to that Council. No man could be more receptive of ideas, more interested in his work or more desirous of doing everything he could for the department than Mr. Goodyer.

## FINANCIAL REPORTS AND MEETINGS.

**The British Electric Traction Co.**—The receipts of all the associated companies of the British Electric Traction Company for the week ended August 1 amounted to £54,611. Upon such of the lines as were working both last year and this year the receipts show an increase of £3,693 upon the week.

**Increased Prosperity at Salford.**—The annual report of the general manager of the tramways, Mr. G. W. Holford, shows that the number of passengers carried was 50,113,120, as compared with 48,720,788 in the previous year. The receipts were £259,704, an increase of £6,389, and the mileage covered was 5,854,830, an increase of 46,461. The earnings per car-mile were 10.645d., and the energy consumption 1.60 units per car-mile, an increase of .02, attributed to the addition of 20 covered bogey cars. The gross profit was £99,766, to which must be added the sum of £5,659 for interest on investments, etc., making a balance of £105,426.

**Bournemouth and Investment of Renewals Fund.**—In his report on the tramways undertaking the borough auditor says that when a transfer to renewals fund has been made, it is incumbent upon them, pursuant to the Corporation Act, 1901, to invest such funds in authorised securities. Having regard to this provision the transfer to renewals fund has not, it would seem, been carried out in the manner enjoined by the statute. The auditor also refers to the importance to be attached to the early establishment of a reserve fund to which they have already given their attention. The net profit of £10,321 for the past year has been transferred to the renewals fund.

**Lanarkshire Tramways.**—The general meeting was held in London on July 31, when Mr. A. R. Monks, chairman of the board, who presided, in moving the adoption of the report, said that the traffic receipts for the half-year showed an increase of £6,314, and the expenses an increase of £3,182 as compared with the receipts and expenses for the corresponding half-year of 1912. He referred to the action of the Lanark County Council in proceeding with the construction of tramways from Uddingston to Bellshill, Mossend, and New Stevenston. Part of these would be in operation by the end of August and the remainder by the end of October. The report was adopted.

Digitized by Google

**Perth Electric Tramways.**—An extraordinary meeting of the Perth Electric Tramways, Limited, was held on August 1, when the special resolution was confirmed that the company be wound up voluntarily. Mr. Oliver Wethered presided. Mr. Charles Wren and Mr. Frank Holyfield, of 30 and 31, St. Swithin's Lane, E.C., were appointed liquidators for the purpose of winding up the company. Mr. E. King proposed a hearty vote of thanks to the directors. They had proved themselves to be keenly alive to the best interests of the shareholders by accepting the offer of the Government to purchase their undertaking, and they might congratulate each other upon the result.

**Manaos Tramways and Light Company.**—The tramway receipts amounted to £106,148, and the lighting to £44,148, against £109,718 and £35,602 respectively for the previous year. The result of the company's operation for the year is a surplus, after meeting debenture interest and sinking fund, of £28,107, which compares with £16,318 for the previous year. During the year under review £21,509 has been spent on capital account, the principal items being the four new cars and certain additional track work required by the concession. To the above-mentioned balance of £28,107 must be added the amount brought forward from the last account, making a total of £31,435. The directors propose to transfer to contingencies reserve, making a total to the credit of this account of £15,725 (after writing off an amount of £4,274), £10,000; to transfer to renewals reserve, making a total to the credit of this account of £21,000, £6,000; to pay a dividend on £300,000 ordinary shares at rate of £4 per cent. per annum, leaving a balance to be carried forward to next year's accounts of £3,435.

**Kalgoorlie Electric Tramways.**—Mr. Allen H. P. Stoneham, chairman, presiding at the meeting of the Kalgoorlie Electric Tramways, Limited, on August 1, said that the accounts were not so satisfactory as could be wished, owing in a great measure to the depressed state of business in Kalgoorlie and to fewer men being employed in the mines. Wages were higher, and consequently while the receipts had gone down the expenses had gone up. The manager, Mr. Stanley, worked extremely hard, and was assidious in his service, but the position was very difficult owing to labour demands. Mr. Stanley was to be highly complimented on the way he had conducted the company's case before the Arbitration Court. They had expected that the Transcontinental railway would help them. The work had been commenced, but in a very half-hearted way, and so far it had not benefited Kalgoorlie. They had hopes that before very long the idea of nationalising everything would extend as far as Kalgoorlie, and the Government would make an offer to purchase the tramways in the same way as had been done at Perth.

**Brush Electrical Engineering Company.**—Mr. E. Garcke, who presided at the 24th ordinary general meeting on July 30, said that he regretted that the reorganisation scheme had not resulted in at least an equilibrium between the expenses and the receipts. If it had not been for the miners' and other strikes the result of the year's working would have been much better. They were engaged on contracts for the Admiralty at Portsmouth, Chatham, and Rosyth. In pursuance of the policy to keep abreast of the latest improvements in steam turbines, they had identified themselves with the Ljungstrom turbine, a Swedish invention, which had been very carefully worked out and tested. The first set of this type—a turbo-alternator of 1,500 h.p. capacity—was put in service a couple of months ago at the power house of the North Metropolitan Electric Power Supply Company. They had orders in hand and in immediate prospect for these machines, and were looking forward to a large demand for turbines of this size. On the rolling-stock side they had besides the usual standard lines of tramcars and trucks, railway passenger coaches and wagons, turned out considerable numbers of motor-omnibus bodies of different types, but principally for service in the metropolitan area. Practically the whole of the bodies on the blue M.E.T. omnibuses, which were now running on the London streets, were their make. This was a line of manufacture for which they were especially well-equipped, and in which they hoped to continue to do good business. The company were greatly indebted to the managing director (Mr. Broadhurst) and to all the staff for the extraordinary efforts which they were exercising to improve the position of the company.

## WEEKLY TRAFFIC RETURNS.

The official traffic returns of 67 of the principal undertakings of the United Kingdom for the week ended August 2 amounted to £261,875, or £20,131 more than in the corresponding week last year, while the track mileage was 2,712, or 52 more than for the corresponding week. The receipts were at the rate of £96 11s. 3d. per track mile, an increase of £5 13s. 8d. per mile as compared with last year.

## AGENCIES WANTED.

Argentine merchant, of English family, first-class connection with the principal English railway companies in the Argentine, now in Europe for a few weeks only, wishes to meet merchants and manufacturers desirous of introducing their goods in the South American market, with a view of taking up their sole agencies. Write immediately to "Argentine," c.o. Agence Havas, 113, Cheapside, London.

## COPPER AND ALUMINIUM MARKET.

August 8, 1913.

Messrs. Henry R. Merton and Co., Ltd., 2, Metal Exchange Buildings, Leadenhall Avenue, E.C., supply the following quotations of prices per ton :—

THE Tramway & Railway World
WITH MOTOR TRAFFIC SECTION

ESTABLISHED 1892. LONDON, AUGUST 14, 1913. VOL. XXXIV.

# THE THURY MULTIPLE-UNIT TRAIN CONTROL SYSTEM

## AS APPLIED TO THE MARTIGNY AND CHATELARD RAILWAY.

*(Contributed.)*

The first practicable application of the Thury system of multiple-unit control was made on the Martigny-Chatelard Railway Company's line forming the Swiss section of the international line connecting La Valais and Chamounix. Experiments of a preliminary character were carried out in 1908-9, in the spring of 1910 the new system was embodied in definite shape, and during the summer seasons of 1910 and 1911 it was in practical everyday use. The thoroughly satisfactory and trustworthy results of these trials induced the company to decide on installing the apparatus throughout their system. This particular installation and the working conditions of the Martigny-Chatelard line are described in the first part of the present article. Fig. 1 shows one of the trains composed of a motor car and trailer fitted with the Thury multiple-control apparatus. Fig. 2 gives a view of the driver's platform on the motor car with the various details of the equipment, master controller, synchronising apparatus, and ordinary controller.

**Fig. 1.—Thury Multiple-Unit Control Train on Martigny-Chatelard Railway.**

The Martigny-Chatelard Railway presents the most unpromising conditions for the application of the multiple-unit control system. It is a mountain railway, forming the continuation beyond Martigny of the line from Fayet which leaves Chamounix and joins up to Chatelard. This portion of the line cannot be equipped, like the rest, with ordinary rolling stock forming trains of four or six carriages because it contains a section of rack railway with a slope of 1 in 5. This section is traversed only by trains consisting of a single motor car with or without a trail car, which latter must always be uppermost, by Government regulation, so that it is pushed up the slope and not hauled up.

As a consequence, on trains with no multiple-unit control equipment it is extremely awkward and difficult to carry out manœuvres at terminal stations, and more especially at the two wayside stations on the rack sections, as the line is single track. The introduction of the multiple-unit control system has overcome these difficulties, retaining the same composition of the trains, the same relative position of the cars, and considerably simplifying the four manœuvres necessary on each double journey.

As the rack section has to be traversed at a speed of 7 kilometres an hour, and the car has to pass on to it without any preparation on account of the gear which is used for adhesion at high speed, the motors have to be designed for the maximum power compatible with the metre gauge. They absorb 240 KW. (326 H.P.) per motor car at the reduced speed of 7 kilometres an hour, equivalent to 650 or 700 H.P. at 16 kilometres an hour (10 miles an hour). The controllers are designed to carry 400 amperes continuously at 650 volts normal load: the step from series to parallel, which is required at the end of the rack section on a slope of 1 in 14, is carried out without any shock or inconvenience whatever. Further, the descent on the steep slopes of the mountain track, especially the 1 in 5 slope of the rack section, is done entirely with the aid of the electric rheostatic brake with a remarkable range of speed, from 7 kilometres an hour on the 1 in 5 slope, to 18 kilometres an hour on the 1 in 14 slope and 22 kilometres an hour on the easier gradients.

To cope with these rigorous conditions, the controllers are made with 24 different positions to satisfy every requirement of this peculiarly difficult line. The train units weigh 56 tons (the motor car 38 and the trailer 18).

The distinctive feature of the equipment of the Martigny Railway is the Thury system of multiple-unit control. Hitherto the problem of control has been solved by the use of contactors which take the place of the contacts of the ordinary car controllers. These contactors are a kind of relay actuated by a master controller operated by the motorman of the train. This system is somewhat complicated, its weight is considerable, and it presents some difficulties

Digitized by Google

in the formation of trains owing to the number of connections to be made between each pair of cars.

To facilitate traffic operations, it is desirable to be able to make up trains in any order, and to drive the train from a trailer car as readily as from a motor car. The drawbacks of the contactor system are more marked when exigencies of traffic demand changes from a service of single motor cars to complete trains. It is then necessary to consider whether it is worth while to "scrap" the existing controllers or to adapt them to a contactor system.

What was wanted by the managers of the Martigny Railway was a means of control which would allow the existing controllers to be used and which would operate them at a distance simultaneously. This solution also limited the cost of alteration, preserved a simple general scheme, and avoided unnecessary addition to the weight of the equipment. Further, the system did not require the transmission of heavy currents in the flexible connections between the cars, and these currents were at a lower voltage than that of the line. These features, it is claimed, are satisfactorily realised in the system of multiple-unit control invented by Mr. Rene Thury, and manufactured by the H. Cuenod Manufacturing Company, Geneva, whose representative in London is Mr. C. Campart, of 49, Newgate Street, E.C. The application of this system allows of the making up of trains in any desired sequence, as the train can be driven from the platform of a motor car or a trailer car equally well, and the number of conductors necessary to connect up the cars is only three, and these transmit small currents at low voltage, the current strength being 1·6 amperes per motor car and the voltage between conductor and earth not more than 46 volts.

The principle of the Thury multiple-control system consists in synchronously operating all the controllers on a train of cars by means of small electric motors run by low-pressure current. A master controller works the sychronising mechanism by electric current from a small battery of 18 cells similar to those used for train lighting. The master controller is fixed on the platform of the car, and is operated by the driver of the train. The synchroniser is attached to the top of the ordinary controller and consists of the driving motor and synchronous mechanism. This system of control allows of a variable number of regulating steps; in the apparatus shown in the illustrations and used on the Martigny-Chatelard Railway there are 24 steps. The controllers are designed to carry a current of 400 amperes.

Fig. 2.—Thury Control System on Motor Car of Martigny-Chatelard Railway.

Digitized by Google

The ordinary equipment required for train driving consists of the following pieces of apparatus:

*For a Motor Car.*—Two master controllers, 2 controllers, 1 ten-way circuit breaker, 2 synchronisers, 1 accumulator battery, and in some cases 1 series-parallel switch.

*For a Trailer Car.*—One, or perhaps 2, master controllers, 1 accumulator battery, 1 ten-way circuit breaker.

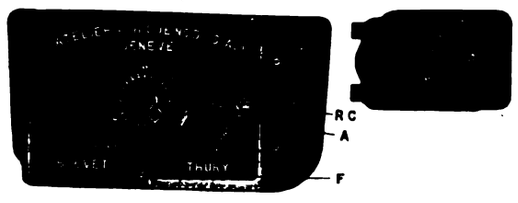

Fig. 5.—Top View.

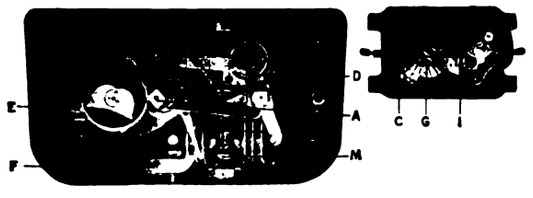

Fig 6.—Master Controller and Automatic Gear Operating the Controller.

The master controller, seen in open and closed positions in Figs. 2 to 6, is a small controller by means of which the driver runs the train. It has on its cover a dial giving all the positions of the main controller barrels, so that the driver can manœuvre it exactly as if he were operating the main controllers themselves, with this advantage, however, that the master controller being very light and having only a small current to transmit, the manipulation is made without any appreciable effort.

The master controller consists of a circuit-breaker (1) —Figs. 4 and 6—and a multiple-way switch (c) connected on one side to the three main control wires leading to the other cars and on the other side to an accumulator battery of 18 cells, two cells being between each contact or strip of the switch.

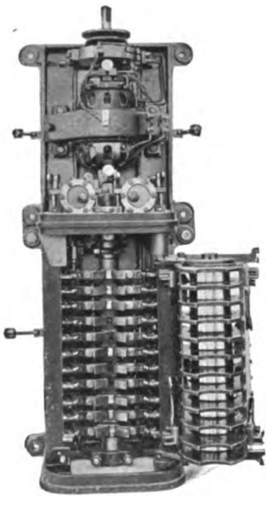

Fig. 7.—Series-Parallel Switch.

In using the master controller, the handle is first placed in position. This is done in two motions; the first closes the circuit-breaker inside the apparatus, and the second engages the contact arms of the multiple-way switch, which make connection between the master controller and the main control wires. The handle cannot be withdrawn until it is brought back to zero position, and this operation disconnects the three main control wires. The movement of the handle alters the position of the three arms of the multiple-way switch (c) and thus allows currents to flow in the three control wires, the sum of which currents, as in a three-phase system, is always zero.

It is advisable to make it a rule only to carry one driving handle on a train so as to avoid the risk of more than one of the master controllers being in circuit at the same time, as the apparatus is only "alive" when in use.

The synchroniser placed on the top of the main controller (Figs. 3 and 4) is shown viewed from above in Figs. 5 and 6. It consists of one motor, one tappet mechanism, and one synchronous transmission.

The little motor (M)—Fig. 6—by means of tappet gear, drives a toothed wheel, keyed on the end of the spindle (A) of the main controller barrel and having as many teeth as there are regulating steps. The supply current comes from an accumulator battery, and

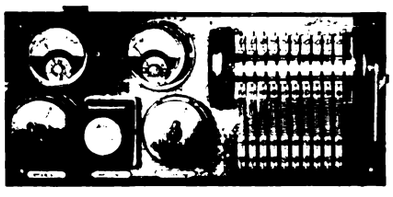

Fig. 8.—Ten-Way Circuit Breaker.

the motor is running all the time the train is in motion. While at work it absorbs about 100 watts, say 2·8 amperes at 36 volts.

The tappet gear placed between the motor (M) and the electro-magnet mechanism (E) allows the motor to drive the controller barrel either in one direction or the other or to leave it at rest, and consists of two tappets held up by two disengaging pawls. As soon as the driver, in starting the train, moves the handle of the master controller, he releases, by means of the synchronous transmission, a stud which holds back one of the pawls: the corresponding tappet thereupon engages in a notch of the toothed wheel and turns the barrel slightly. The movement of the pawl is effected by a stud, the displacement of which is due to the action of differential gear driven on the one hand by the motor and on the other hand by the controller drum in such a manner that the drum always tends to bring the stud back to its original position.

The synchronous transmission apparatus consists of an electro-magnet and a very light armature (E) mounted just like the rotor of an alternator, between its poles. The electro-magnet is excited by a current from the accumulator battery, and the armature is connected to the three control wires, which pass along the whole length of the train and through these wires to the master controllers on the car platforms.

As mentioned previously, the movement of the handle of the master controller shifts the three arms of the multiple-way switch, causing three currents, of which the sum is always zero, to flow in the three control wires. These currents act on the armature of the electro-magnet, holding it instantaneously in a particular position which remains the same as long as the three arms of the multiple-way switch in the master controller are stationary. Every movement of the handle, altering the position of these contact arms, is copied faithfully by the armature of the electro-magnet. However many sets of apparatus are in service the synchronism is always perfect. As soon as the position of the armature (E) is changed in one direction or the other one of the pawls is held up, the corresponding tappet engages in the toothed wheel and turns the controller drum the number of steps corresponding to the new position of the armature.

Every movement of the master controller in the hand of the driver is thus accurately reproduced in all the controllers in service. Any error in position of an armature which in any case cannot exceed one-twelfth of the circumference or 30 deg., would be immediately corrected by the tappet, which can only take up the position rigidly prescribed by the toothpitch of the wheel.

Digitized by Google

*Working of the Synchronising Apparatus.*—As a natural result of the conditions above described, the driver, standing on any platform of the train provided with a master controller, can simultaneously command all the motor cars in the train, with absolute assurance that every movement of his hand is immediately transmitted to every controller barrel. As before mentioned, the master controller has on its cover a dial which shows the same steps and corresponding marks as on the ordinary controllers, so that the driver is always able to tell the position of the controller barrels. (See Fig. 5.) As a rule there is a master controller on both the front and rear platforms of each car, so that the train can be driven from the foremost platform, however it should be made up.

*Controllers.*—The motor cars are equipped with two ordinary barrel-type controllers of practically standard design, with a reversing barrel, permitting it to be used as an electric brake. With the unit-control system, the driver can always keep to his position at the head of the train; and it is not absolutely necessary to equip the motor cars with two controllers apiece unless one is wanted to act as spare. These controllers (Fig. 4) only differ from the ordinary type in the transition stage from series to parallel, which is carried out on a separate barrel. They are furnished with a handle to enable them to be operated by hand independently of the synchronous-control system. In this case a special key (F)—Figs. 5 and 6—puts the synchronous-control mechanism out of action.

To make a controller ready for service, it is only necessary to turn the reversing drum (EG)—Figs. 4, 5, and 6—to the forward or backward position by hand; the current will then flow in the little motor as well as the magnetic circuit of the synchronous apparatus. By the same action, the armature (E) is connected up to the three control wires which run the length of the train and are, in turn, connected to the master controllers.

*Series-Parallel Switch.*—This apparatus (Fig. 7) is designed to make the transition from series to parallel in one immediate step instead of five or six, as is usual. As the time required for these five steps would be a little longer with the control system than with hand operation, a slight retardation of the train would take place, causing a perceptible jolt on reaching the first parallel step, and this would be accentuated on a steep incline, say 1 in 15 for instance. This trouble is avoided by passing from series to parallel at a single step; it is done in about one-tenth of a second, and even on a steep incline the jolt is imperceptible. This arrangement offers another great advantage, namely, that the sparking, which in an ordinary controller takes place during the passage from series to parallel, is taken by the S.P. switch, where special precautions can be taken to extinguish it.

The switch is worked by a shunt from the 36-volt battery. The current only flows during the brief period of operation and is automatically cut off just before its completion. The switch is independent of the synchronous-control system proper, and works in the same way whether the controller is operated by hand or by transmission from the master controller. One series-parallel switch is enough for the two controllers of a motor car.

*Ten-Way Circuit-Breaker.*—This circuit breaker, shown in Fig. 8, is used for switching off all the supply circuit from the battery. It is furnished with resistances for keeping the momentary short-circuit currents set up in passing from one contact to the next on the master controller within proper limits. On the same panel are mounted the voltmeter and ammeter for the battery circuit.

In order to be able instantaneously to cut off the current to the motors in case of emergency, a fourth wire is added to the three control wires. This wire takes current from the battery to excite the coils of all the maximum cut-outs. The driver can in this way put every motor on the train out of action at any given instant. He has then only to bring the controller barrels to zero and lock the handle.

*Battery.*—The importance of the battery depends on what duty is required of it; it can be utilised for the magnetic brakes. If used for the synchronous control only, a battery of 18 cells is sufficient, the current necessary for the master controllers being 1·06 amperes per motor car, and three amperes per controller. The batteries are kept fully charged by a shunt current of about 2½ amperes, taken from the line through fixed resistance. The lighting circuit is used for this purpose. As may be seen, the capacity of the battery is of rather secondary importance as it is mainly a regulating device.

*Formation of a Train.*—Trains can be made up of any number of motor car units, with or without trailer cars; if the latter are equipped with master controllers on their platforms they can be put at the head or tail of the train, or in the intermediate positions at will. The driver usually stands on the foremost platform whether the car is a motor or a trailer, but he can equally well drive from any other platform if necessary.

The train can be quickly made up, because there is only a simple socket to connect besides the ordinary couplings. This socket carries three contacts corresponding to the three control wires (which are only at 36 volts potential difference from earth). A fourth contact enables all the automatic cut-outs to be tripped from any platform provided with a master controller.

## A HIGH-PRESSURE DIRECT-CURRENT ELECTRIC LOCOMOTIVE.

The high-pressure direct-current system of electric traction on railways is being gradually developed in various foreign countries, and as it is beginning to be tried in England considerable interest attaches to the designs employed abroad. Some electric locomotives which are being put into service on the Butte, Anaconda, and Pacific Railway in the United States are the first direct-current locomotives working at as high a potential as 2,400 volts. The railway in question has hitherto been worked by steam locomotives, and the conversion of part of it has been a large task.

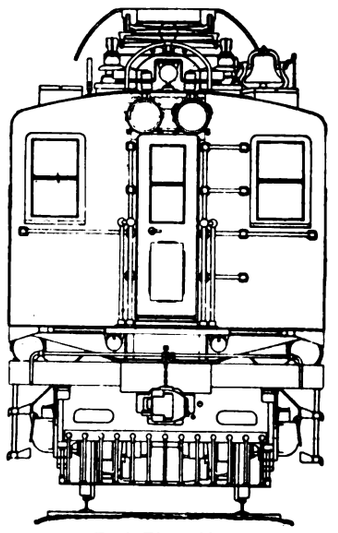
The traffic demands on this particular railway are unusually severe, and consist principally of hauling long trains of copper ore over heavy mountain gradients. The 2,400-volt direct-current system was considered best suited for exacting service of this character; for its adoption presented an opportunity to realise unusual economies, both in initial expenditure and the cost of operation. The section of the road that has been equipped lies between Butte and Anaconda, Montana. It comprises 30 miles of main line single track, and numerous sidings, etc., aggregating a total of about 90 miles on a single-track basis. The haulage of copper ore, together with all mine supplies, lumber, etc., amounts to practically 5,000,000 tons of freight per year. Complete freight trains weighing 3,400 tons are made up of 50 loaded steel ore cars, and will be handled against a ruling gradient of 0·3 per cent. by a locomotive consisting of two of the units illustrated.

The initial equipment, consists of 17 locomotive units, type 0440-E-160-4 GE-229-A, 15 for freight and two for passenger service. Each unit weighs approximately 80 tons. The two units for forming the freight locomotives in each case will be coupled together and operated in multiple unit. The combination freight

Digitized by Google

locomotives will haul the usual trains of 3,400 tons, at a maximum speed of 15 miles per hour against the ruling grade and at 21 miles per hour on level tangent track.

The passenger locomotives are of the same design as the freight locomotives, except that they are geared for a maximum speed of 45 miles per hour on level tangent track. A schedule of eight passenger trains



End Elevation.

per day, four each way, is maintained, the average train being composed of a locomotive and three standard steam railway passenger coaches. All the locomotive equipment, as well as the sub-station apparatus and overhead line material, were designed and built by the General Electric Company of America.

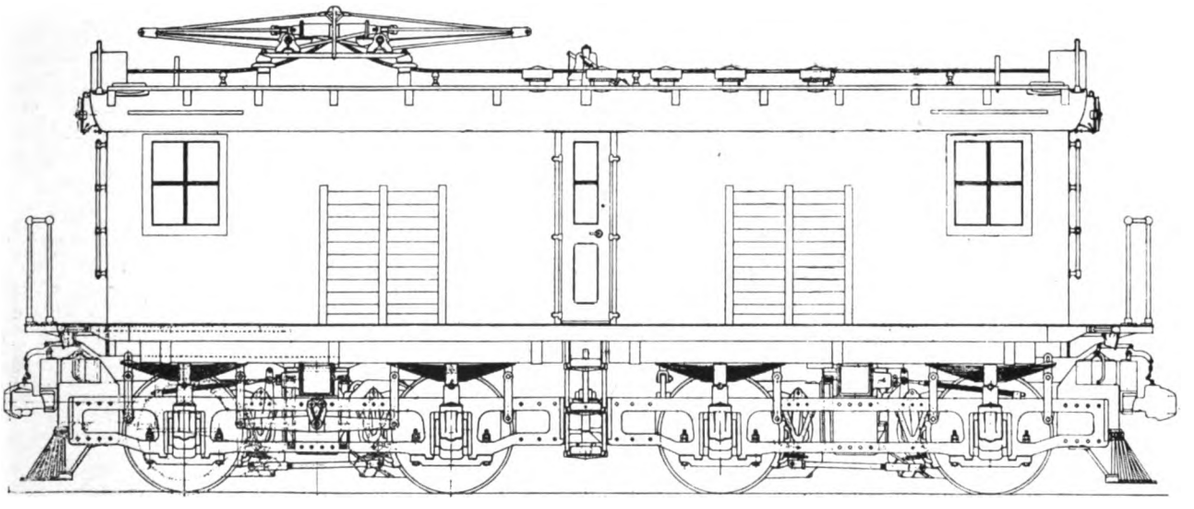
The locomotives are the articulated double-truck type with all weight on the drivers. The cab containing an engineer's compartment in each end and a central compartment for the control apparatus, is connected by end frames and a cast-steel centre transom. The entire weight is carried on semi-elliptic springs suitably equalised.

The engineer's compartment, at either end of the cab, contains the operator's seat, controller, air brake valves, bell and whistle ropes, ammeter, air gauges, sanders, and other control apparatus that should be within immediate reach of the engineer. In the central section is grouped the control apparatus. The contactors, reversers, and rheostats are mounted in two banks running lengthwise of the compartment. All parts and circuits carrying current at 2,400 volts are thoroughly protected from accidental contact. A dynamotor is employed to furnish 600-volt current for operation of the contactors, lights, and air compressor.

The principal data and dimensions applying to the locomotives are the following:

| | |
|---|---|
| Length inside of knuckles | 37 ft. 4 in. |
| Length over cab | 31 ft. |
| Height over cab | 12 ft. 10 in. |
| Height with trolley down | 15 ft. 6 in. |
| Width over all | 10 ft. |
| Total wheel base | 26 ft. |
| Rigid wheel base | 8 ft. 8 in. |
| Track gauge | 4 ft. 8½ in. |
| Total weight | 160,000 lb. |
| Weight per axle | 40,000 lb. |
| Wheels, steel tyred | 46 in. |
| Journals | 6 in. by 13 in. |
| Gears, forged rims, freight locomotives | 87 teeth. |
| Gears, forged rims, passenger locomotives | 80 teeth. |
| Pinions, forged, freight locomotives | 18 teeth. |
| Pinions, forged, passenger locomotives | 25 teeth. |
| Tractive effort at 30 per cent. coefficient | 48,000 lb. |
| Tractive effort at one-hour rating | 30,000 lb. |
| Tractive effort at continuous rating | 25,000 lb. |

The motors are of the GE-229-A commutating pole type, wound for 1,200 volts and insulated for 2,400 volts. A forged pinion is mounted on each end of the armature shaft and meshes into a corresponding gear mounted on the wheel hub. The gear reduction is 4·84 on the freight locomotives and 3·2 on the passenger locomotives. The GE-229-A motor is designed especially for



Side Elevation, 2,400-Volt Direct-Current Electric Locomotive.

carried by the two truck frames on centre pins. It is of the box type, extending the entire length of the locomotive, and is provided with end and side doors. On each axle is mounted a motor of the twin-geared type. The friction draft gear mounted on the outer end frame of each truck transmits the hauling and buffing stresses directly through the truck frame, diverting these strains from the centre pins and under frame. The trucks are built of heavy steel castings. The side frames are of a truss pattern with heavy top and bottom members and pedestal tie bars. They are

locomotive service, is enclosed and provided with forced ventilation. The method of ventilation circulates effectively a large volume of cool air throughout the motor and keeps all parts at a uniform temperature, eliminating the possibility of "hot spots." The continuous capacity of each motor is 190 amperes at 1,200 volts under forced ventilation, and 225 amperes at 1,200 volts for the one-hour rating. For the double-unit 160-ton locomotive this is equivalent to a continuously sustained output of 2,100 H.P.

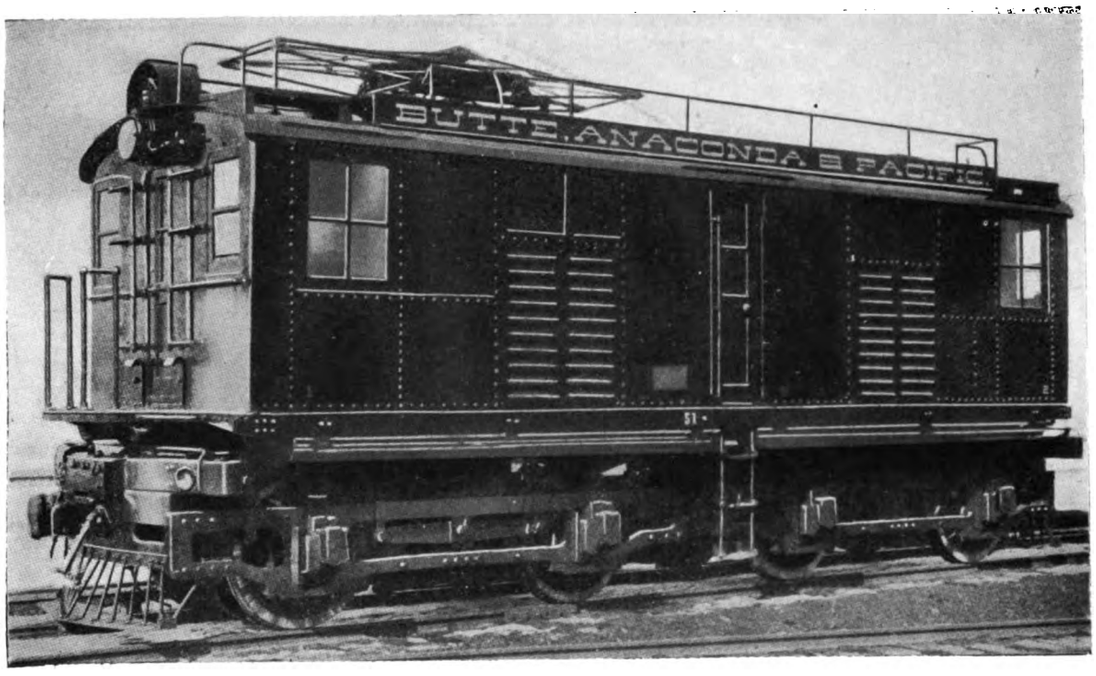
The control equipment on the locomotives is the

Digitized by Google

well-known Sprague-General Electric type M multiple-unit control, and is designed to operate the four motors in series and series-parallel. The pairs of motors with their respective resistances are all connected in series on the first point of the controller. The resistance is varied through nine points on the controller, and finally short-circuited on the tenth or running point. The pairs of motors are then operated similarly in series-parallel and all resistance is cut out on the nineteenth point, which is the full speed running point. The smooth transition between control points permits acceleration close to the slipping point of the wheels. A switch is provided having manually operated handles for cutting out either pair of motors, so that the locomotive can then be operated with one pair of motors in the usual way.

The contactors are actuated by the 600-volt circuit obtained from the dynamotor, and are of a design similar to that employed in the standard type M control. The principal variations are embodied in the method of insulating for the higher voltage. The main switch is provided with a powerful blow-out, so that heavy currents can be opened.

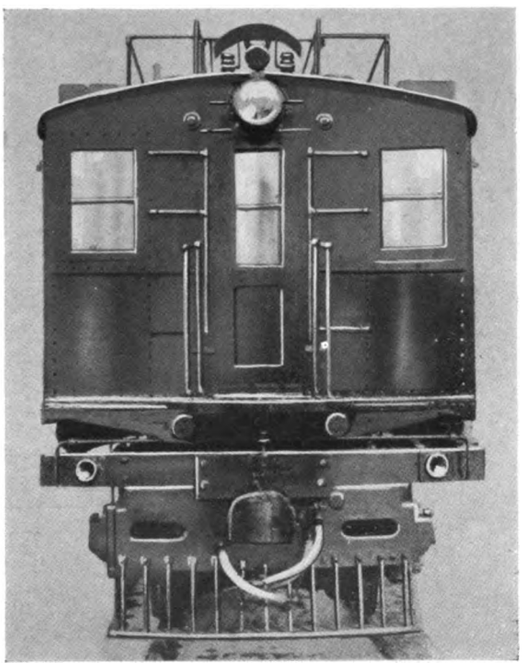
There are one main fuse for the trolley circuit and two fuses for the motor circuits. There is also an auxiliary circuit fuse for protecting locally the dynamotor and heater circuits. The main motor and auxiliary fuse boxes are provided with powerful magnetic blow-outs, energised by current passing through the fuse, to insure proper rupture of the arc. An ammeter is located at each engineer's position, and indicates the current in the circuit of one pair of motors. The main motor rheostats are formed of cast-iron grids assembled in a frame and insulated by mica. Twenty resistance units are provided for each passenger locomotive, and 26 resistance units for each freight unit.



2,400-Volt Direct-Current Electric Locomotive.

Current is collected by overhead trolleys of the pantograph type. They are pneumatically operated, and can be put into service from either engineer's compartment by a hand-operated valve. Each passenger locomotive is equipped with two collectors, and each freight unit with one collector. A 2,400-volt insulated bus line connected direct to the pantograph is run along the centre on the roof of the cab. The locomotives are equipped with arc head lights. The interior illumination of the cab is provided by ten incandescent lamps arranged in two circuits.

The air brakes are the combined straight and automatic type. The air compressor, the CP-26 type, is two-stage, motor-driven, and has a piston displacement of 100 cubic feet of air per minute when pumping against a tank pressure of 135 lb. per square inch. Pneumatic sanders are provided. All wiring is drawn through conduits and carefully protected.



End View of 2,400-Volt D.-C. Electric Locomotive.

**International Tramways Congress.**—The London County Council has decided to become a member of the International Tramways and Light Railways Union, which has its headquarters in Brussels. The annual subscription payable for the Council is £12. The chairman or vice-chairman of the Highways Committee will represent the Council at the next biennial International Congress of the Union, which will be held next summer in Berlin. The Congress has not met in London since 1902, the meetings having been held in various other European capitals.

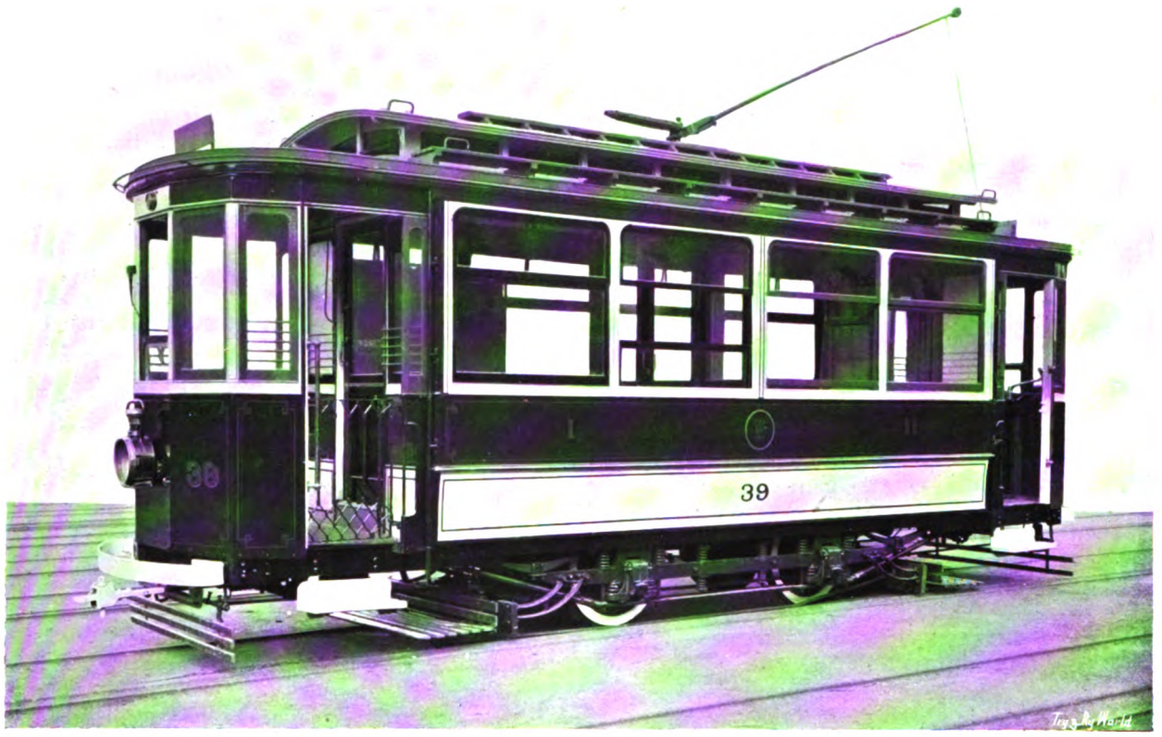
## NEW CARS FOR SALONICA.

Tramway business, like every other sort of civil enterprise, must no doubt have been greatly interfered with in Turkey and the Balkan States ever since the war broke out, but there is good reason for the belief that after peace is restored there will be a great development of business industry in that part of the world. By way apparently of anticipation of coming developments the United Electric Car Company, of Preston, have recently completed 12 motor cars for the Tramways et Eclairage Electriques de Salonique. Of these vehicles we are enabled to give the following description.



Exterior View of Car for Salonica.

The principal dimensions are:

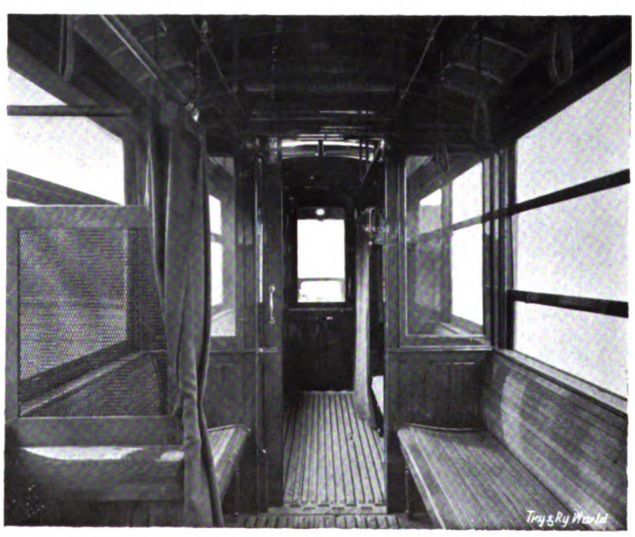
| | Ft. | in. | Mm. |
|---|---|---|---|
| Length of body over corner posts .. | 18 | $2\frac{13}{16}$ | 5,560 |
| Total length over all .. .. .. | 29 | $5\frac{7}{16}$ | 8,980 |
| Width over body .. .. .. .. | 6 | $8\frac{1}{4}$ | 2,040 |
| Clear height inside at centre .. .. | 8 | 6 | 2,592 |
| Wheel base of truck .. .. .. | 6 | 6 | 1,981 |
| Gauge .. .. .. .. .. | 3 | $3\frac{3}{8}$ | 1,000 |

Seating capacity, 22 passengers.

These cars, as will be seen by the accompanying illustrations, are of the closed single-deck type, and are mounted on a standard four-wheeled truck manufactured by the United Electric Car Company. The car bodies are divided into first and second-class compartments. The interior woodwork of the first class compartments is of polished mahogany, the ceiling being covered with lincrusta. The seats are upholstered in rattan. The interior woodwork of the second-class compartment is of varnished oak, the ceiling consisting of laths of ash with the roof ribs of the same material. The seats are of light oak laths.

In both compartments the seat on one side is of the longitudinal type. On the other side there is a longitudinal seat, and in the corner near the doorway there are two cross seats *vis à vis*. These cross seats are separated from the longitudinal seat by a trellis work of expanded metal, and can be isolated from the remainder of the compartment by hanging curtains, thus forming a "harem" compartment.

The ventilator lights in both compartments are a rich ruby. The side windows are divided into two parts, the upper part being fixed, and the lower part being arranged to drop. Both compartments are provided with spring roller blinds of the United Electric Car Company's own type made in English leatheroid. The rich effect of the dark mahogany finish of the first-class compartment is heightened by contrast with the light finish of the second class compartment, and the general appearance of the cars, which are painted on the outside in a dark brown relieved with cream, is very handsome. The platforms are fitted with vestibules and provided with wrought iron gates.



Interior of Salonica Car.

The equipments have been furnished by the Allegemeine Elektricitäts-Gesellschaft, of Berlin.

# SEE THAT YOU GET YOUR FARES.

By Henry Mozley.

P-A-Y-E having at last arrived from over the water, it seems an appropriate time to revive the question of the collection of tickets by conductors, and to this end I ask you to give the following quotation from an article which appeared in your journal in February, 1895 (18 years ago), page 56.

> "Now as to the check the conductor has against the passenger. It is impossible for any conductor by memory to say who has paid and who has not; therefore, every passenger must prove he has paid on leaving the car or at the collection on nearing a terminus by producing a ticket or pay the fare. It is a great mistake not to collect the tickets which involves no trouble at all. It is not sufficient to issue the ticket; it must be collected, otherwise there is no assurance that the passenger has paid his fare."

It was some time after the above date that certain Canadian managers realised the loss from missed fares, and adopted the P-A-Y-E system to see that all fares were collected.

We owe it to the Aberdeen Corporation that the first tangible proof of the serious losses from missed fares is available. It is impossible to say exactly how much per cent. the loss amounts to, but the result at Aberdeen of adopting the Canadian system to stop the loss cannot fail to arrest the attention of all tramway undertakers.

Figures in the public press show the comparison and gain between the period with and without the P-A-Y-E system, the first week amounting to 13·26 per cent., and later returns showing a gain of 10·00 per cent. Of course, it is not to be believed that the loss from missed fares amounts to anything like this sum, because we all know that tramway traffics all round show substantial increases; moreover, there may be special circumstances which affect the comparisons with last year, but assuming the loss is only 2½ per cent., the following statement will illustrate what an important amount the loss may be. Assuming the loss from missed fares is 2½ per cent. of the annual gross receipts, the amount lost would be as follows:

| Name of Undertaking. | £ | Name of Undertaking. | £ |
|---|---|---|---|
| Accrington .. .. | 685 | Liverpool .. .. | 15,776 |
| Ashton-under-Lyne | 556 | Manchester .. | 22,217 |
| Birkenhead .. .. | 1,531 | Nottingham .. | 4,179 |
| Blackburn .. .. | 1,586 | Oldham .. .. | 2,700 |
| Blackpool .. .. | 1,836 | Preston .. .. | 1,074 |
| Bolton .. .. | 3,378 | Rawtenstall .. | 650 |
| Bradford .. .. | 7,240 | Rochdale .. .. | 1,993 |
| Bury .. .. | 1,690 | Rotherham .. .. | 1,005 |
| Chester .. .. | 306 | Salford .. .. | 6,492 |
| Darwen .. .. | 365 | Sheffield .. .. | 8,964 |
| Doncaster .. .. | 498 | Stockport .. .. | 1,578 |
| Halifax .. .. | 2,625 | Sunderland .. .. | 1,712 |
| Huddersfield .. | 2,695 | Wallasey .. .. | 1,450 |
| Hull .. .. .. | 3,929 | Warrington .. | 572 |
| Lancaster .. .. | 139 | Wigan .. .. | 1,756 |
| Leeds .. .. | 10,188 | York .. .. | 549 |

Supposing the loss only half the amount shown in the above statement, the leakage should receive the serious consideration of tramway undertakers. But how are you to see that no fares are missed? You can either see that each passenger pays on entering the car, or demand from each passenger a ticket on leaving the car *en route*, and go round the car when nearing a terminus and collect the tickets from those remaining on the car to the end of the journey. The only person who can be held responsible for seeing that all passengers pay is the conductor in charge of the car. Therefore, he must be on the rear platform at every stop, where he serves the double purpose of seeing that every passenger pays, and to the safety of passengers entering and leaving the car; a further requirement is an obligation on the driver not to start the car by signals other than those given by the conductor on his bell.

When the loading is heavy, such as at holiday times and week-ends, a second conductor (who need not be fully qualified either from age or experience—a job for learners or youths working up) is necessary, as passengers begin to leave the car before the conductor in charge has got all the fares. It is on such occasions that the need for the collection of tickets to see that all pay is the most necessary and useful—the assistant conductor cannot possibly know whether the passenger leaving the car whilst the conductor in charge is away from the platform has paid his fare or not, unless he demands and collects the ticket or fare. The conductor in charge of the car cannot remember who has paid and who has not; therefore it is necessary he should in every case demand the ticket from the passenger on leaving the car or within a short distance of a terminus, and the greater the loading the greater the necessity for doing this. Very occasionally the loading is so heavy that it may be necessary for a second conductor to join the car within a quarter mile of the terminus to assist him in doing this.

The objection that it takes time for a conductor to attend to the rear platform is not a valid one. The time required for stopping and starting does not exceed an average 16 seconds, and time should be allowed in any case, as it is far more important that the conductor should start the car from the rear platform only than that the time for the journey should be so cut down that a conductor is induced to neglect the rear platform, both for the check on the receipts and for the safety of passengers getting on and off. A good deal more might be said on the question, but for the present it will suffice if I conclude with the independent opinion of four experienced conductors, which will probably be quite as instructive and entertaining as anything I can say.

The views of conductors who are seeing that every passenger pays as an ordinary part of their duties:

Conductor H. McAuley.

1. What advantages to a conductor is the systematic collection of tickets?—It is to see that every passenger on the car is in possession of a ticket and has paid his fare for the journey he has travelled.

2. Suppose there is no collecting; what is the effect on the collection of fares?—Passengers may travel beyond their stages without paying excess fares.

3. Would fares be lost which are prevented by collection?—Yes.

4. Does collection facilitate the work, lessen or increase your work?—It increases the work of the conductor. It keeps the car tidy from being strewn with used tickets. The collection of fares and nipping the discount tickets complicates the duties of a conductor

Conductor W. Heap.

1. One of the chief advantages to a conductor is that he knows if every one has a ticket and where they should get off.

2. If there were no collection it would be possible for a passenger to override his stage, especially with a fully loaded car.

3. To a certain extent it increases the work, but on the other hand it enables you to make sure whether everyone had paid his fare or not, which you could not if there were no collection.

4. With the present number of tickets, workmen's discounts and ordinary, it would be impossible to tell whether everyone has been booked if you did not collect them at all.

Suppose you did not collect the tickets: what is to prevent a passenger from using the ticket twice, if the car was packed as the early workmen's are in a morning, unless an inspector boarded the car, and to do that properly he would have to board every car, which is impossible for one man to do. One of the chief reasons why it is necessary to collect the tickets is by doing so you have a check upon the passengers.

Conductor J. Howarth.

In answer to question No. 1, with regard to the advantages of collecting tickets, I might say that it is a big advantage to the Corporation

Digitized by Google

and it also assists the conductor to follow out his duty properly; as you will know we have a lot of intermediate fares overlapping one another and passengers override; now I don't know what they would do if we did not collect tickets. I think some of them would only pay when an inspector boarded the car and then they would probably not book to Burnley or B. St. as the case might be, as they know that the inspector will not ride all the way on that car. We have enough trouble now to get the fares from some of the passengers as they will not pay if the conductor does not ask them for it, and any one can miss a fare as you cannot think of them all. I have had cases where I have been in the car eight or nine times and called out "Fares, please," and you will find some of them haven't booked when you are collecting your tickets.

With regard to no collection of tickets, I think it would be a wrong thing to do, especially in Burnley with such big cars, as it takes one man all his time to watch them now and, if we did not collect tickets, well, I think we should have passengers picking tickets out of the streets and riding with them. If an inspector got on they would put the old ticket away for another time and pay because the inspector had got on, so you see it would need an army of inspectors or checkers to watch them, especially with ordinary discount tickets and workmen's discount tickets. They would get to know the conductor's nipper number and then they could use an old ticket with that conductor's nipper number on. It would be as good as a free pass to some of them, especially men who have worked on the cars, and have left. The same thing would apply again with specials, as some of the conductors out of the depôt run the same special nearly every morning, and the passengers use the cars the same way. You see it would be quite easy for passengers to defraud the Corporation, and an inspector could check the car and not know, unless he thought that someone was doing it. Then he could take the number of the ticket and watch cars in that way.

In answer to No. 3 question, I am certain that more fares would be missed, especially at week-ends and other busy times. Some of the new men don't collect tickets now, as it takes them all their time to collect fares. I have heard of passengers going to Burnley from Duke Bar, and getting off again in the centre without paying their fares, so you see more fares would be lost still if passengers knew that we did not collect tickets.

I have questioned some of the spare men on fares, and they could not tell me a single one of the cross-town workmen's fares; so you see this class of men get all their fares mixed up before they have got halfway through a load. It is a thing of the past with some of them to book passengers while their car is standing at the centre. They would sooner wait until they get a big load, and then they have to book them on the rear platform, and the passengers haven't time to see their tickets punched. I should like to see that notice regarding conductors booking fares when their car is standing at a terminus at busy times repeated, as some of the new men laugh when you tell them to book at the centre. They say the passengers would only laugh at them.

I might say that it involves a little more work to collect tickets, but at the same time it causes the conductors to have to come out to the rear platform to see the passengers get off safely, and I think it is a fine idea for that alone. The ladies want a lot of watching, at least my experience teaches me that, as I have often to help one lady or another. If I didn't they would fall on the road. Then again, the conductor does not get into the habit of ringing off from inside by having to come out to collect tickets; and another thing is, the cars are kept cleaner with our system, and you don't hear of some little boy or girl getting run over through collecting tram tickets out of the street. I have answered the above questions to the best of my ability. Hoping they will meet with your approval.

H. Snape.

Are there any advantages in the system of collecting tickets?—Yes. The conductor is enabled to find those passengers whom he may have missed seeing when they boarded the car. He is also enabled to find out the passenger who may have inadvertently forgotten to offer his fare when the conductor passed round the car. The collection of tickets also enables the conductor to bring to earth the passenger who is deliberately attempting to avoid paying his fare and, although it may be thought by many that, for the sake of a penny, no one would attempt such a thing, I say from experience these passengers are legion. The conductor has every facility for checking the passengers who have overridden their stage.

2 and 3. Would there be a loss of fares by discontinuing the system of collecting tickets?—My eleven years' experience gives me conclusive proof that a great loss would be inevitable. Again, some years ago myself and a friend discussed this question and finally decided to test several towns when on travel. At Manchester, Liverpool, Birkenhead to Port Sunlight, Douglas, I have got off after riding a good distance and paid my fare in the street to the surprise of the conductor.

4. Does the collection of tickets increase the conductor's work?—The collection of tickets slightly increases the work of a conductor, but the effort put forth is a mere detail in comparison to the good results accruing from the system, which I should consider it futile to discontinue.

## ORDERS FOR ELECTRIC RAILWAY EQUIPMENT.

The following important orders for electric railway equipment were placed some weeks ago, as previously reported in our Saturday issues.

Train Equipments for the London and North Western Electric Lines.

A contract has been arranged with the Maschinenfabrik Oerlikon, near Zurich, to supply electrical equipments for over 40 trains required for the electric section of the London and North Western Railway. A previous order for four train equipments had been placed with Siemens Brothers Dynamo Works, Limited. Particulars as to the electrification scheme were given in The Tramway and Railway World of January 9, 1913.

London and South Western Railway.

The contract for motors and other train equipments required for the first part of its electrification scheme, as described in these columns on December 12, 1912, has been let to the British Westinghouse Electric and Manufacturing Company, Limited, Manchester. The conductor rails will be supplied by Messrs. Bolckow, Vaughan, and Company, Limited, Middlesbrough, and the North Eastern Steel Company. Orders for high-tension cables have been placed with Messrs. Siemens Brothers and Company, Limited. Electric energy will be generated at a pressure of 11,000 volts at a station to be erected by the railway company. Units of 10,000 kw. and 5,000 kw. will be installed. The sub-station equipments will be obtained from the British Thomson-Houston Company, Limited. The first section to be electrified will be the line from Waterloo *via* Clapham Junction to Richmond, Twickenham, Kingston, and back to Waterloo *via* Wimbledon The electrical work is being carried out by the Company's electrical engineer, Mr. Herbert Jones, the whole of the work being under the supervision of Messrs. Kennedy and Jenkin. Permanent way work will be carried out by the company's staff under the supervision of the chief engineer, Mr. J. W. Jacomb-Hood.

## PROTECTIVE DEVICES AT THE LONDON COUNTY COUNCIL TRAMWAY STATION.

At the meeting of the London County Council just before the summer recess, a specially important report was presented by the Highways Committee upon the subject of guarding against breakdowns at Greenwich power-station. The committee stated that they had given special consideration since the serious breakdown of plant at the station in April last to the question of arranging for the installation of protective devices with the object of guarding against breakdowns in future. Mr. A. L. C. Fell, chief officer of tramways, had conferred with Mr. G. W. Partridge, chief engineer of the London Electric Supply Corporation, and as a result the chief officer had submitted certain proposals. The cost of giving effect to the scheme was estimated at £25,000, including £7,000 for the switch gear required for the two 8,000-kw. turbo-generators, which the Council on May 6 last decided to obtain from the British Westinghouse Company. The committee were strongly of opinion that these protective devices should be installed, and they recommended accordingly. They also proposed that Mr. Partridge should be paid 200 guineas.

The Finance Committee, reporting on the matter, said that the principal question which arose from the financial point of view was the bearing of this expense, regarded as an insurance against further breakdowns. A breakdown such as that which occurred recently was a very serious matter as regarded loss of revenue, and it was also very important to establish and maintain the prestige of the tramway undertaking for reliability. If this could be secured by the expenditure proposed, the money might perhaps be regarded as well spent. While this was so, this new charge on the undertaking at the present time in order to preserve existing revenue was a serious mattter. The report was approved.

## TROLLEY WIRE DESIGN ACTION.

Vice-Chancellor Smith, K.C., on July 8 gave his decision in the case in which the British Insulated and Helsby Cables, Limited, of Prescot, near Liverpool, sued the London Electric Wire Company and Smiths, Limited, of the Anaconda Works, Salford, for an alleged infringement of registered designs for wires for overhead trolley tramways, and asked for an injunction to restrain defendants from further use of their copyright. His Honour remarked that one of the designs was registered on March 7, 1908, and had been called in the case design A. The other was registered on April 9, 1908, and had been known as design B. Both wires were grooved, and were about half an inch broad between the lower shoulders at their broadest part, being rather less from the top of the semi-circle to the lowest part of the segment. Judging by the eye alone, to which test he was driven, he was unable to see such a distinction between plaintiffs' designs and the others as would enable him to say that plaintiffs' designs were novel. If design B was valid he held that there had been no infringement, and there would be judgment for defendants with costs.

LONDON, AUGUST 14, 1913.

**Rating of Tramways.**

At length the final decision has been given on the question of the rating of tramway tracks. The House of Lords on July 24, in the case of the Tottenham Urban District Council against the Metropolitan Electric Tramways, decided that tramways must continue, as in the past, to pay rates on the full net annual value and not on one-fourth of that value as contended by the tramway authorities. Under the Public Health Act, 1875, railways pay on one-fourth of their net annual value, and the decision of the House of Lords in the Wakefield case in 1908 put light railways in the same favoured position. In the present case the Divisional Court decided against the company; this was reversed by the Court of Appeal, and now the House of Lords have restored the judgment of the Divisional Court. In the briefest form it may be said that the Court of Appeal held that the subject rated is in the words of the Public Health Act "land used as a railway." The House of Lords on the other hand (as will be seen from the full text of the judgment published in this issue) deny that a tramway is a railway in either the legal or the popular sense, and they hold that if the abatement provided for railways in the Public Health Act had been intended to apply to tramways the Act would have said so. Lord Moulton's remarks about the construction of tramways under powers obtained by a Light Railway Order being an abuse of the Light Railways Act are quite erroneous. At the time the Act was passed it was frequently stated both in Parliament and out of it that the Act could be used for authorising lines on streets and roads. That, however, is beside the mark. The law as now declared gives the absurd result in Tottenham that one part of a through route is rated four times as heavily as another part because the former was authorised as a tramway and the latter as a light railway. Yet the one part is indistinguishable from the other as to mode of construction, equipment, and appearance. The same cars run over both parts. That is the local position. The general one is that no tramway in England gets relief in rating. Tramway authorities all over the country must regret the decision, but their business now is to persuade the Government if possible to pass legislation for the reduction of the excessive burdens on tramways, and at the same time to put a fair burden on the railless trolley and motor omnibus.

**Necessity for Relief of Tramway Taxation.**

Events arising out of motor omnibus competition in the metropolitan area continue to develop, and they point more and more decisively to a certain final result. That result—recognised on all hands by reasonable people—will be the allocation to omnibuses of a fair amount of taxation, the proceeds of which will go direct to road maintenance. One new event at the end of last month was the development of the promised action by London County Council in the matter of the rating of tramway tracks. It was announced at a meeting of the Council on July 29, that in consequence of the decreased revenue of the tramways owing to omnibus competition, objections to the assessment of the tracks have been served in no fewer than 23 metropolitan boroughs. The boroughs make the assessment, and it is they who receive from the County Council the rates on the tracks. If this action is successful, the result—while putting the tramway accounts into a more favourable state—will be somewhat serious for

Digitized by Google

the ratepayers. Any considerable reduction in the assessment of the tramways must result in an increase in the rates per pound. It seems that in one case which is expected soon to be settled, the reduction in tramway assessment will probably involve an increase in the rates of about one-third of a penny per pound. Then, on July 30, just before the rising of the Courts for the long vacation, an application was made in the King's Bench Division of the High Court for a rule *nisi* for a mandamus calling on the Assessment Committee of Islington Borough Council to show cause why they should not appoint a person to make a provisional valuation list, with a view to inserting in it the part of the London County Council Tramways in the borough at a reduced assessment. It was mentioned that the receipts from the tramways in the borough have, during the past two years, in consequence of omnibus competition, dropped from £114,000 to £89,000. It appeared that other Borough Councils have agreed to make new provisional lists, and the Court granted the application.

* * * *

Another factor which is becoming more and more prominent is the increased cost of street maintenance owing to motor traffic, not merely to the County Council for the tramway area of the streets, but to all the Borough Councils for all other street surface. One member of the County Council stated at the meeting referred to that it was estimated that within the next few years a sum of three or four millions sterling will have to be spent on remaking with thicker and stronger foundations the streets and roads of the metropolis in order to withstand heavy motor traffic. In this direction also there is the prospect of higher rates. Thus, not only are all metropolitan tramway undertakings suffering, but the whole community has to pay for the maintenance of a permanent way for omnibuses which are earning large dividends for shareholders. The omnibuses have nothing to pay for the construction of their permanent way, nothing to pay for its maintenance, and nothing to pay as rates on it. The tramways have to pay all three. It is quite plain that the position is becoming intolerable. We have in the past foretold what would happen, and have urged action with the object of influencing Parliament. West Ham Corporation Tramways, in consequence of the competition, show a loss on last year's working—the first loss they have ever made. Unless something is done, other metropolitan tramways will follow suit. It is imperative that all concerned should follow up the call recently given by Mr. Goodyer, the manager of Croydon Corporation Tramways, and set a full-fledged agitation on foot. It is perfectly clear that if omnibuses had to bear the burdens of taxation and road maintenance which lie on tramways, it would be impossible for the omnibuses to be run at a profit. We do not desire that taxation should be so heavy as to be an obstruction to the extension of motor omnibus services; but these should bear a fair share of the public burdens. It is fair to no one that the omnibus undertakings should be allowed to remain parasites on the community for the purpose of paying dividends to shareholders. While all these things apply to London to-day, they may speedily apply to other parts of the country, both urban and rural, unless the local authorities are very alert. Even now the counties are threatened with interurban services of omnibuses which within six months would smash up rural roads which are not constructed to withstand such traffic.

---

**Industrial Efficiency.**

The managers and directors of tramway undertakings, in common with those responsible for the conduct of every sort of industrial and commercial enterprise, are now constantly being confronted with demands for increased wages pressed upon them by labour organisations in a manner they are not always able to resist. In meeting such demands the former are often under the disadvantage of not being able, like the latter, to make a corresponding advance in price of the goods produced, *i.e.*, in the service rendered to the public. To require that the particular workers concerned shall earn the additional remuneration demanded by extra exertion on their part is generally impractical, if only because such demands are usually accompanied by an agitation for easier conditions of employment. In these circumstances any suggestion of a remedy or partial remedy deserves attention. The tramway manager will naturally welcome any suggestion which provides

Digitized by Google

him with another resource in defending the profits of the undertaking from the effect of the demands made upon it. Such a resource, or a suggestion towards it, comes from the least expected quarter. Psychology is a word familiar to all, but one usually associated with the more abstract and least practical of philosophical discussions. In its latest developments, however, this science has taken a severely utilitarian turn. Modern psychology deals with the processes by which the mind comes to its decisions and imposes them upon the body. With no practical aim in view, and actuated by pure love of science, psychologists for many years devoted themselves to the elaboration of methods by which these processes could be analysed, arranged, and exactly measured both in regard to the time required to perform them and the efficiency with which they are done. A mass of information was thus accumulated which some business-like people in the United States of America were the first to see might be put to profitable purposes. In the first place it was found, as the result of analysis, that the processes instinctively adopted by workers in many manual occupations were unnecessarily complex, that willing workmen could easily be taught to effect the same operations in simpler ways; in some cases, of which the handling of bricks and mortar in certain building operations is an example, the individual's output was so much improved that the workmen could be re-trained at the employer's expense, and their wages largely increased with economy. In the next place it was found that individuals varied to an enormous degree in unsuspected ways. That a thing done slowly and clumsily, though conscientiously, could be accomplished quickly, accurately, and easily by another. In some cases, an example of which was furnished in the operations by which ball bearings are manufactured, an increased output of nearly 100 per cent. was brought about by setting each employee to the detail of work to which, as the result of a psychological examination, he was found to be adapted.

* * * *

If a tramway manager is able to choose his employees and put them to work with such discrimination that none is occupied but with what comes easiest to him, the least advantage which may be expected is a more contented body of men, and that the working should be neater, quicker, and in other respects better, is no more than a reasonable anticipation. In such achievements as have been described, methods of psychology are applied to the attainment of objects which have been the conscious aim of all since industry of any kind began. The only difference is that what was formerly pursued by vague and unco-ordinated means of observation and conjecture, is now sought out by scientific methods with instruments of precision. In its latest developments psychology makes a new departure altogether, and seeks to enable us to form judgments upon an individual's capabilities which have hitherto rested upon guess-work only. Who can say how a man will behave in an emergency? In the case of a tramcar driver the emergency may be that caused by a child, or some other creature getting in front of the car while it is in motion. The driver has then to take in a lot of facts relating to distances, positions, and relative speeds, to come to a decision and to act upon it, within perhaps some fraction of a second. Here, again, individuals differ enormously in innate capacity, and ordinary life seems to afford no indications, or misleading indications only, as to the nature and degree of such differences. The conclusive test which the street affords is too dangerous and too expensive. It was the high figure to which "compensation of accidents" rose in some American tramways that first led to the application of psychological methods for ascertaining the true qualifications of tramcar drivers for the exigences of their employment. Professor Munsterberg, who is one of the pioneers in the application of psychological methods to improvements in industrial operations, attacked the problem first by analysing the mental and nervous processes called into play, and then by inventing an instrument by which these processes could be measured and recorded. The men were subjected to examination by the help of this instrument, and those who failed to exhibit average proficiency were gradually eliminated from the service or set to other work better adapted to their capabilities. It is satisfactory to relate that in every case in which the method was adopted a marked reduction in the number and seriousness of accidents ensued, so the matter well deserves attention.

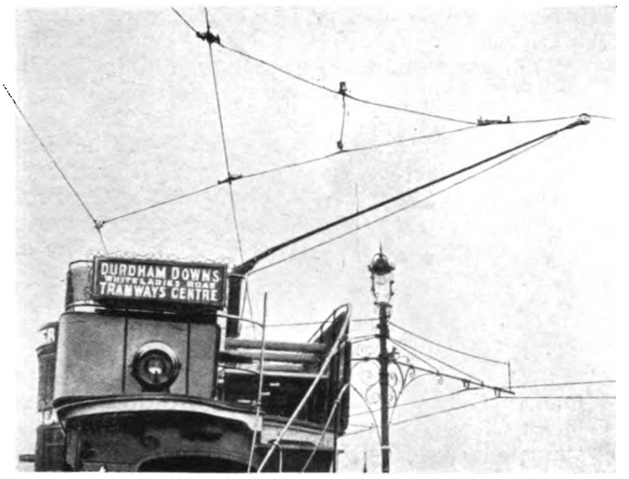
## AUTOMATIC TROLLEY REVERSERS.

The convenience of automatic trolley reversers is so unquestionable that it is surprising that they are not in more general use. In the accompanying illustration a car is shown passing under a reverser which has been in use for the past 10 years in Bristol, and is one of 20 erected in various parts of the city. All of these are giving complete satisfaction.

At dark termini this apparatus has the great advantage that by the use of it the lights in the cars are kept burning, thus obviating the danger and confusion that,



Trolley Boom on Automatic Trolley Reverser.

owing to everything being plunged in darkness, often arises when the trolley is being turned round by the conductor. In places of this kind it is, of course, often the practice to put up lights, but the expense of this is considerable and the upkeep troublesome, and of course such lights are unnecessary where the reverser is used. There are other advantages in the use of this reverser. In the first place a considerable saving of time is effected if the car happens to be late, or at busy times when it is important for the cars to clear as quickly as possible, and, secondly, the damage done to the trolley wire and trolley head in the process of getting the trolley on to the wire is entirely done away with.

The automatic reversibility of the swivelling trolley head affords its greatest advantage over the straight-running head, and the fact that the reverser is so little used at present can only be due to the simplicity and cheapness of the apparatus not having been properly appreciated in the right quarters. With reversers at each of the termini the trolley rope can be tied to the boom on leaving the car shed and not touched until the car runs in at night.

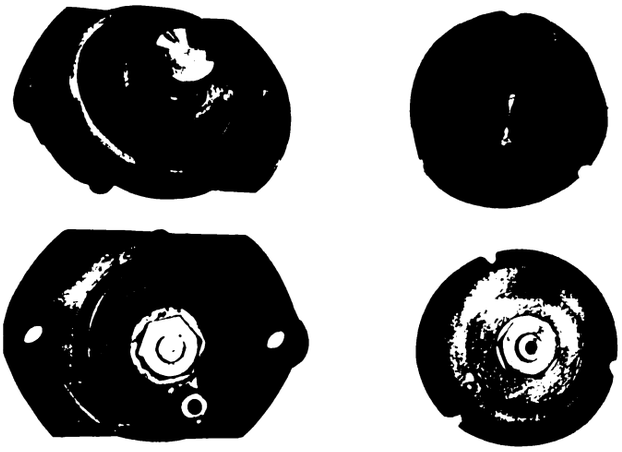
In order that the trolley shall have perfect freedom for the automatic reverser it is essential that a swivelling contact of approved type shall be fitted to the trolley base. After considerable experience in the matter Messrs. Brecknell, Munro, and Rogers, of Bristol, designed and patented a swivelling contact which may be used in connection with either single or double-deck trolley bases, and not only gives the freedom required for automatic turning, but at the same time protects the trolley standards from becoming electrically charged. The trouble occasioned by a leaky conductor must obviously be introduced by a fault in the cable, such faults developing during the daily use of the trolley and by way of a breakdown from wear in the insulation covering the conductor.

In almost every case this fault is due to the straining or twisting of the cable during the partial revolution of the trolley.

Until comparatively recent years the trolley cable was led straight through the trolley and coiled beneath the trolley base in order to permit of its partial revolution without unduly straining the insulating covering of the cable; such an arrangement at the best is but a compromise. The alternative of the plan above referred to is the provision of two contacts jointed and so arranged that the cables may be connected on the upper and lower side of these contacts in such a manner that the trolley may revolve without any relative movement with the cable. All earlier forms in which this device was put upon the market contained weaknesses which ultimately led to the temporary discontinuance of its use, the attendant troubles being worse than the difficulties they were designed to obviate. These troubles were chiefly due to imperfect insulation and bad contact.

The principal features of the "Brecknell" swivelling contact are the method of preserving efficient contact, the arrangement of the insulation and provision for draining and ventilating the whole so as to maintain the insulation surfaces in good condition, and the means by which the former troubles which existed with regard to lubrication are overcome. The two contacts have convex and concave surfaces, which are struck at the correct radius so as to compensate for any change in alignment due to the ordinary wear of the trolley.

The surfaces of the insulation have been ascertained to be the minimum advisable, and by a system of draining and ventilation holes, the moisture that ordinarily collects on all internal metallic chambers during the various changes of temperature and atmospheric conditions is carried away, and the insulation surfaces maintained in a dry and efficient condition. The area of contact and the spring controlling the pressure are so adjusted that, with the two special alloys used in the construction of the pair of contacts, no lubrication is necessary. In fact, one tramway



Brecknell Swivelling Contact.

company who are using a large number of these have not found it necessary to give these contacts any attention during a period of three years, over which time no fault of any description had developed. The period named was not closed by any trouble, but was merely the time at which inquiry was made as to their efficiency.

**Municipal Tramways Association.**—At the meeting of the London County Council on July 29, Mr. W. J. Squires, vice-chairman of the Highways Committee, and Mr. A. L. C. Fell, chief officer of tramways, were appointed to represent the Council at the conference of the Municipal Tramways Association, which will be held at Sheffield on September 24, 25, and 26.

## CONVERTIBLE CARS AT BALLARAT.

The Electric Supply Company of Victoria, Limited, who operate the tramways and light and power supply of the cities and districts of Ballarat and Bendigo, Victoria, have lately put into service five new cars. These cars at Ballarat, owing to the rather exceptional climate, have been specially designed to suit both winter and summer conditions. The summers are fairly hot, but owing to the elevation of the city, 1,500 ft., the

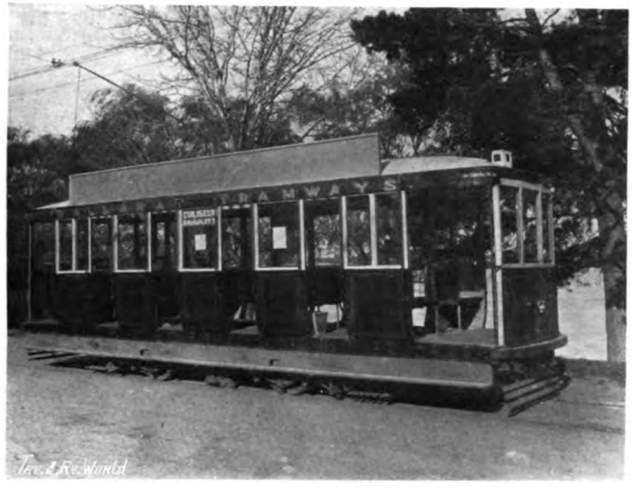

Fig. 1.—Arrangement for Summer Service.

winters are occasionally very cold, the climate being similar to that at home, but not so severe.

The photographs reproduced herewith show the Ballarat car, of which three have been put into service. The first view (Fig. 1) shows the car arranged for summer service, and the second photograph (Fig. 2) for winter service. The two windows in each of the bulk heads, and the three windows in the glass screens, all let down, so there is a current of fresh air right through the car. This gives a form of construction

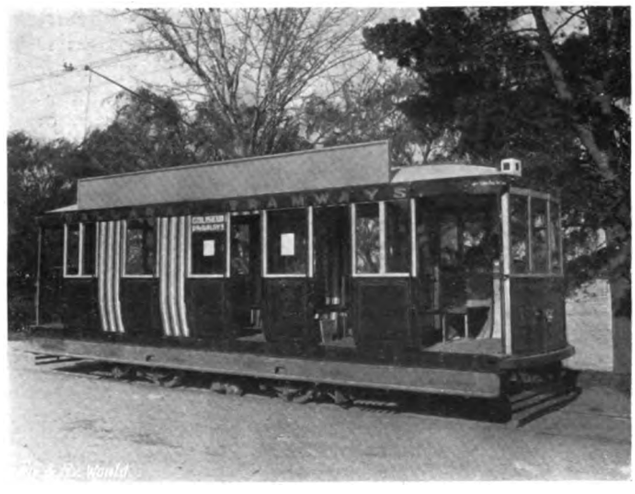

Fig. 2.—Arrangement for Winter Service.

which is not usual in Australia, but which is very necessary for climatic reasons. The cross seats are arranged back to back and the centre seat in each one is removable. Opposite each of the four side openings, excluding the end platforms, spring roller blinds working in side guides can be pulled down. In rainy weather in summer time it is quite sufficient to pull down these blinds on the weather side. The doors in each of the bulk heads can be bodily removed for summer service.

In Fig. 2 each of the central cross seats is shown removed; the doors in the bulk heads and the spring roller blinds are drawn down opposite each of the four side entrances. Two of the front blinds are shown up, so as to show the back blinds, and the central seats removed. The windows in the bulk heads and screens are all drawn up, and passengers then enter the car from the end platforms through the door in the bulk head. The car as arranged thus is quite comfortable, and owing to the large side windows is quite bright inside.

The car has a seating capacity of 50, when arranged as a summer car, and 45 as a winter car. The end platforms are of a large capacity and are useful for accommodating standing passengers in rush traffic. The overall length of the car from buffer to buffer is 31 ft.

The car bodies were built by Messrs. Duncan and Fraser, of Adelaide, and are carried on the Brush Engineering Company's patent long wheel base trucks. The electrical equipments were provided by the British Thomson-Houston Company, and are of the American General Electric Company's manufacture. The cars are also fitted with Westinghouse track brakes.

## LIVERPOOL'S DECORATED CAR.

One of the attractions of the visit of the King and Queen to Liverpool on July 11 was the decorated and illuminated car designed by the general manager of the Corporation Tramways. The car was decorated with garlands of leaves and flowers, red and pink roses forming a good contrast to the green foliage. On the sides of the car were representations of the Colonies, whilst on the windows were transfers agreeing with the Colonial representations. The ends of the car were designed to form bowers, and above these were canopies draped with purple and gold containing life-like busts of their Majesties—that of the King being on one end of the car and that of the Queen on the other. Above the canopies were mounted large gilded crowns.

At night the car was illuminated with some 1,500 lamps in ruby, blue, and white, these being entwined in the foliage, set off the floral decorations. A large star, formed of various coloured lamps, was mounted in front and another at the rear, the colours changing automatically, being controlled by a rotary cut-out driven by a belt off the axle. The car body was picked out in gold and white, whilst between each lamp were placed copper reflectors, which enhanced the lustre at night time. Our photographs give some idea of the elaborate decoration of the car, which ran on almost every route, and during the royal progress appeared at intervals on the line of route as their Majesties passed by.

The week of the Royal visit imposed an enormous tax upon the tramway department; and it is highly gratifying to know that not only was the working of the tramway service carried out with the utmost efficiency under the direction of the general manager (Mr. C. W. Mallins) and his staff, who were working early and late for the greater part of a week, but that a record has been established in the matter of traffic receipts.

A glance at the figures given below, which were presented in a statement to the Tramway Committee, gives an idea of the enormous volume of traffic dealt with on five days when the public took advantage of the cars to view the decorations and to witness other features of the Royal visit. The total revenue for five days was £13,974 9s. 6d., there were 2,856,896 passengers carried, and the mileage covered was 219,627.

Decorated and Illuminated Car—Liverpool Corporation Tramways.

Digitized by Google

The high-water mark of traffic was reached on Friday, the occasion of the State visit of their Majesties, when no fewer than 750,641 persons travelled by the cars—practically equal to the entire population of Liverpool. The receipts for the week ending Saturday, July 12, show an increase of £4,173, but in addition there is the very substantial yield from the following Sunday's traffic of £2,145 17s. 4½d.

The results attained exceed all previous records for tramway traffic in Liverpool. The nearest to it was the immense volume of traffic on the occasion of the Coronation of King Edward in June, 1902. The principal day, Thursday, June 26, 1902, produced an income of £3,083 5s. 0½d., which is easily beaten by the takings on Friday, July 11. A further testimony to the smooth and efficient working of Liverpool tramway system during a period of abnormal pressure is that no accident of a serious character occurred during the Royal week.

The returns were as follow:

| | Receipts. | Passengers. | Mileage. |
|---|---|---|---|
| | £ s. d. | | |
| Wednesday, July 9 .. .. | 2,013 15 5½ | 431,248 | 39,120 |
| Thursday, „ 10 .. .. | 2,942 1 9½ | 608,304 | 43,213 |
| Friday, „ 11 .. .. | 3,802 3 0½ | 750,641 | 52,408 |
| Saturday, „ 12 .. .. | 3,070 11 10 | 639,778 | 48,004 |
| Sunday, „ 13 .. .. | 2,145 17 4½ | 426,835 | 36,792 |
| Total for five days (including Sunday).. | 13,974 9 6 | 2,856,896 | 219,627 |

The traffic receipts for the week ended Saturday, July 12, were as follow, viz.:

| | Receipts. | Passengers. | Mileage. |
|---|---|---|---|
| | £ s d. | | |
| | 17,097 1 9 | 3,545,582 | 283,357 |
| Increase over the corresponding week of 1912 | 4,173 0 9 | 795,688 | 42,586 |

THE TRAMWAY COMMITTEE'S APPRECIATION.

At the committee meeting Major R. J. Clarke, deputy-chairman, presiding in the unavoidable absence of the chairman (Alderman F. Smith), expressed on behalf of the committee their satisfaction at the splendid results achieved, which proved that no effort had been spared by the general manager, the tramway staff, and the electrical staff in making the best arrangements for the travelling public. On the suggestion of the chairman, the committee passed a resolution expressing their sense of appreciation at the excellent work which had been performed by those concerned.

It was also decided that each man at Lambeth Road works—mechanics and others employed in the sheds—who had a holiday on the Friday of the Royal visit should be voted a day's pay. As regards the whole of the staff who had to work on that day, and had no holiday, they were voted double pay.

## TABLE MOUNTAIN (CAPE TOWN) RAILWAY PROJECT.

In September last Mr. H. H. Peters, a mountain railway expert, of Zurich, visited South Africa, at the invitation of the Cape Town Council, for the purpose of advising as to the best means of constructing a railway to the summit of Table Mountain. Careful surveys were made, with the view to the selection of the most feasible routes, and plans have been completed for two alternative schemes. One of these provides for a funicular railway, starting from Rocklands, and the other for a rack and pinion line, starting from Kloof Nek. The former would be an open-air line for almost the whole distance, but the rack and pinion line would include several tunnels. A tramway would have to be constructed to Rocklands, the starting point of the funicular line. The terminus would be at the top of the gorge, and a short distance before reaching the summit the line would pass through a tunnel about 270 ft. in length. The rack and pinion railway would start from Kloof Nek, and a little less than a mile from the starting point would go through a tunnel about 450 ft. long. There would be a second tunnel nearly 100 ft. in length, and a third of 175 ft. The time required for the journey to the summit by the funicular railway would be 26 minutes, and by the rack railway 52 minutes.

The British Trade Commissioner now reports that the Cape Town Corporation has unanimously approved of the funicular railway scheme as opposed to the rack railway, the latter being considerably more expensive and offering no greater advantages. The Cape Town Corporation has submitted the scheme for the approval of the other local municipalities. The Trade Commissioner considers that the scheme will in all probability be adopted.

## BOOK NOTICES.

MANUAL OF ELECTRICAL UNDERTAKINGS.

This indispensable manual, now in its fourteenth year, should be, and we hope is, known to everyone concerned in the electrical industry. It is compiled under the direction of Mr. Emile Garcke, M.I.C.E., and contains, as usual, full statistics, brought up to date, of electric lighting, power, and traction works in operation or projected in Great Britain and Ireland, India, and all British Colonies. The present volume contains 1,856 plus cxciv. pages (8¾ in. by 5¾ in. by 2¾ in.), and is published at 21s. net by the Electrical Press, Limited, 13-16, Fisher Street, near Kingsway, London, W.C. Of "Garcke's Manual" it is sufficient encomium to say that it fully maintains the reputation it has gained in all these years as an indispensable and reliable book of reference. The new feature of the previous edition, viz., the large map showing electric light, power, and traction undertakings in the United Kingdom, is again issued as a separate supplement, being too large to be inserted in the manual itself.

"SANE TRADE UNIONISM" AND OTHER VOLUMES.

The National Library (Collins Clear Type Press, London and Glasgow) consists at present of twenty small octavo volumes, the outstanding feature of which is specialised information by the most competent authorities. Each number is printed in clear type, runs to about 270 pages including an index, and the price of each in full cloth is 1s. net. No. 1 has been specially written for the series by Mr. W. V. Osborne on "Sane Trade Unionism." Mr. Osborne, who was formerly an employee of the Great Eastern Railway Company, is the central figure in the controversy raging round the "Osborne" judgment, and has the right to speak with authority on the subject he has chosen. The author is evidently an original thinker, and the bibliography at the end shows that he has industriously studied his subject. He warns trade unions of the dangers ahead due to the competition of Asiatic labour—which is gradually working into the same grooves as the older associations of workmen in Europe and America. Their inferior standard of living will, in course of time, constitute a serious menace to the progress of other nations. Union leaders should strive above all to bring capital and labour together. "In this direction lies the mission of sane unionism."

# THE RATING OF TRAMWAYS.

## JUDGMENT BY THE HOUSE OF LORDS.

The House of Lords, on July 24, gave the important decision that tramways in England are liable to pay rates on the whole of their annual value and not on one-fourth as is the case with railways. This decision was arrived at in the well-known case of the Urban District Council of Tottenham *v.* the Metropolitan Electric Tramways, Limited, and it involved reversing the finding of the Court of Appeal and restoring that of the Divisional Court. The text of the decision is appended:

TOTTENHAM URBAN DISTRICT COUNCIL, *Appellants*,

AND

METROPOLITAN ELECTRIC TRAMWAYS, LIMITED, *Respondents*.

The LORD CHANCELLOR: My Lords, in this case I have had the advantage of considering the judgment about to be proposed by my noble and learned friend, Lord Moulton, and I concur in it. I am asked by my noble and learned friend, Lord Shaw, to say that he also concurs in that judgment.

LORD MOULTON: My Lords, this is an appeal from a judgment of the Court of Appeal in England upon a special case stated by two of His Majesty's Justices of the Peace in and for the County of Middlesex under the provisions of the Summary Jurisdiction Acts, 1857 and 1879, for the purpose of obtaining the opinion of the High Court on a question of law which arose before them upon an application of the appellants, the Tottenham District Council, to enforce the payment of the balance of a certain rate amounting to £499 12s. 6d. by the respondents, the Metropolitan Tramways Company, in respect of a tramway owned and worked by the respondents in the district. The respondents had paid a sum equal to one-fourth of the said rate, and claimed to be exempt from payment of the other three-fourths by reason of the provisions of section 211 of the Public Health Act, 1875. The magistrates held that the respondents were not entitled to the benefit of the exemption, and affirmed the rate, but at the request of the respondents stated the present special case in order to obtain the decision of the courts upon the point.

The special case came before a Divisional Court of the King's Bench Division which affirmed the decision of the Magistrates, it being admitted by the respondents that the case was covered by the decision of a Divisional Court in the case of *the Swansea Improvements and Tramway Company v. The Swansea Urban Sanitary Authority*, and that such decision was binding on the Divisional Court. From this decision an appeal was brought to the Court of Appeal, which reversed the decision of the Divisional Court, and in doing so expressly overruled the Swansea case. From this decision of the Court of Appeal the present appeal is brought.

The tramways in respect of which the rate is claimed were constructed by the North Metropolitan Tramways Company under the North London Suburban Tramways Order, 1879 (confirmed by the Tramways Order Confirmation Act, 1879), the North Metropolitan Tramways Act, 1892, and the North Metropolitan Tramways Act, 1897. To these Acts the provisions of the Tramways Acts, 1870, apply. It has not been suggested (nor could it have been so with any show of reason) that any portion of these tramways stands in a different position to the others with regard to its right to the exemption claimed. It will, therefore, conduce to clearness if the question of the exemption be considered in respect of some one of the tramways, say that constructed under the Order of 1879. The right to the exemption in question, if it exists, must have accrued at the date of its construction, because there has been no subsequent legislation which could in any way affect it.

Section 211 of the Public Health Act, 1875, deals with the assessment and levying of general district rates under the Act, and provides that they shall be levied on the full net annual value of such property. But there are certain exceptions, the only relevant one being as follows: "Section 211 (1) *b*: The owner of any tithes or of any tithe commutation, rent charge, or the occupier of any land used as arable, meadow, or pasture ground only, or as woodlands, market gardens, or nursery grounds, and the occupier of any land covered with water or used only as a canal or towing path for the same, or as a railway constructed under the powers of any Act of Parliament for public conveyance, shall be assessed in respect of the same in the proportion of one-fourth part only of such net annual value thereof."

Speaking for myself, I cannot think that if the question of the exemption or non-exemption of a tramway from the full incidence of the general district rate had come before the courts soon after the date of this Act, the courts would have found any difficulty in deciding the question, or would have had any doubt that tramways were not included in the term "railways." For to my mind these two terms had, in the public legislation of this country, different and distinct meanings attached to them by the highest sanction that it is possible to give, *i.e.*, that there existed two independent groups of statutes of a public nature, the one applying to railways and the other to tramways, framed on distinct lines and recognised as applicable to distinct subject matter, and neither finding it necessary to give any definition of such subject matter. Nothing could be more striking than the careful and elaborate research of the counsel that appeared on behalf of the respondents before this House in the argument of this appeal, and yet they have been unable to find one single instance of confusion in the use of these terms in public legislation or of doubt as to the limits of the applicability of any piece of public legislation in this respect, at all events before the passing of the Light Railways Act, 1896. Indeed, if the public Acts relating to railways be examined, it will be found that in the one or two instances where the legislation is intended to apply to tramways also, it is effected by the insertion ~~of a~~ special interpretation clause providing that in that Act the term railway shall include tramway. But in the great bulk of the public legislation relating to railways there is no such definition clause, and that legislation has universally been understood and interpreted by the courts as applying only to that which is popularly known as a railway, and not to that which is popularly known as a tramway.

To my mind, therefore, the fact that the legislature uses the word "railways," and does not say "railways and tramways," in section 211 of the Act of 1875, is conclusive as to whether it is intended that tramways should enjoy this exemption. For in the year 1875 tramways loomed very large in public view. The demand for them, and the necessity of regulation of the terms on which the privilege of constructing them should be granted to private undertakers in view of the interest of the public, had during the preceding few years become so marked that a most important general Act regulating them, *i.e.*, the Tramways Act, 1870, had been passed after much discussion and careful examination in its passage through Parliament. It is, to my mind, impossible that the legislature should in 1875 have used the word railways as including tramways without inserting a definition clause expressly including them, as it had done in certain previous Acts. But if it had intended that the exemption should apply to tramways, it would, in my opinion, have in all probability taken the simpler course of saying so expressly in the clause itself, and I am confirmed in this opinion by the language of section 147 of the same Act, which deals with the power of an urban authority to adopt bridges within their district. Here the words are: "Any urban authority may agree with the proprietors of any canal, railway or tramway to adopt or maintain any existing or projected bridge, viaduct, or arch within their district over or under any such canal, railway or tramway."

In the exemption that is to be found in section 211 (1) (*b*), canals and railways are mentioned, but there is no mention of tramways, and it would in my opinion, be contrary to sound principles of the construction of statutes if we were to interpret railways as including tramways in this section, in disregard of the consistent usage of the words in public statutes, and the evidence which the statute itself gives in section 147 that it recognised the distinction between the two terms.

The respondents attempt to meet these difficulties by a very ingenious argument. They point out that the Public Health Act, 1875, was a consolidating statute, and that clause 211 is taken from the Public Health Statute of 1848, and they argue, therefore, that it should be interpreted as the language would have been interpreted in 1848 and not in 1875. There are two answers to this argument. In the first place, the Public Health Act, 1875, was not purely a consolidating statute. It purported to amend as well as to consolidate the existing Public Health Statutes, and did so to a very substantial extent. But the main answer to the argument is that no assistance is obtained by going back to the Act of 1848. At that time public tramways, in the sense in which the words are always used, were unknown, and certainly the term "railways" could not have been used by th legislature with the conscious intention of including therein what w now know as tramways. If this House had to determine the question as if it arose in the year 1848, one would have to look closely at the language used in order to learn from it what were the grounds on which railways were granted the exemption in order to decide whether those grounds applied to the new type of works known as "tramways." It is always a dangerous, and generally an unfruitful, task to seek for the motives which influence the legislature in any particular legislative Act, but if I were to permit myself so to do I should base my conclusions on the company in which I find railways standing in the exemption. Its companions are "land covered with water," "land used only as a canal or a towing path for the same," and it itself appears as "land used only as a railway constructed under the powers of any Act of Parliament for public conveyance." In view of the common characteristics of these three it appears to me to be that the legislature is dealing with a class of lands stricken with a certain disqualification for partaking in the advantages of municipal expenditure by reason of the nature of the user of those lands—namely, either as being covered by water or being used solely as a canal or solely as a railway. And I may add that if I were considering the question as in 1848, I should have concluded that "lands" was used in the section in its ordinary and natural meaning, and not in the extended meaning which is given to it in questions of rating. I do not believe that the legislature had

Digitized by Google

before it at that date the conception of a railway running on lands other than those which it had acquired for itself, and which were dedicated to the use of the railway properly so-called. But in 1875, when the existing Public Health Act was passed, the legislature must be taken to have been fully seized of the existence of tramways availing themselves of the public streets, and also to have been aware that, in the language of public statutes, these new constructions were always called by the special name of "tramways," and under such name were subject to special legislation. The fact that the word "railways" did not include "tramways" is, as I have said, recognised in the statute itself, and it would, in my opinion, be pushing the doctrine of tracing back the origin of sections in consolidating statutes too far if under such circumstances we were to hold that, in the Public Health Act, 1875, a different meaning ought to be given to the word "railways" in section 211 to that which it would naturally bear at that date.

If it were admissible to speculate as to the motives of the legislature in exempting railways from the full burden of the rates, I should be inclined to adopt the view expressed by Mr. Justice Earle in the case of *The South Wales Railway Company v. The Swansea Board of Health*. He there says: "The general scheme of the enactment is that the occupiers of the classes of property most benefited by the expenditure of the district rates shall be liable to be rated at a higher rate, the occupiers of the classes less benefited at the lower rate."

This fully accounts for the exemption of railways running on their own lands and partaking of few, if any, of the advantages of municipal expenditure so far as their line is concerned. But tramways are not in a like position. The public streets provide them not only with support for their rails, but also, as it were, with arrival and departure platforms, for they collect and deposit their passengers all along the route which they take. I can think of no class of property within a town which more directly, and to a fuller extent, reaps advantages from municipal expenditure, in the way of the construction, maintenance, lighting, and sewering of streets (which forms so large an item of municipal expenditure), in addition to its dependence on the general prosperity of the town, which is secured by municipal expenditure on other objects. Tramways seem to me so little *in pari casu* with land solely occupied for railways in the matter of meriting exemption from rates, that I have the greatest doubt whether any responsible authorities in 1875 would have proposed to exempt tramways from the full burden of rates, or if they had proposed it the legislature would have granted it. One cannot forget that in the year 1875 tramways were entirely in private hands, and there is no trace in the legislation of that period of any desire on the part of the legislature to put them in a favoured position.

One other argument of respondent's counsel must here be noted. It was argued with great elaboration that "tramway" etymologically fell under the denomination "railways" by reason of the fact that the cars run upon rails. In my opinion such arguments have little or no value. The meaning of words is fixed by usage, and if, as in my opinion is the case here, the two words "railway" and "tramway" had in popular and legislative usage distinct meanings, it makes no difference whatever whether those meanings flow from the etymological genesis of the words or not. When people spoke of tramways in 1875, there is, in my mind, no doubt that they meant something different from railways, and when the legislature used these two words in the two streams of legislation relating to railways and tramways, they recognised and followed this distinction of usage, and that is all that is necessary and sufficient for the purposes of construction of the relevant statutes.

Before passing to the events of 1896, and subsequently, which have, in my opinion, given rise to all the difficulties in this case, I must notice the case of *The Swansea Improvements and Tramway Company v. The Swansea Urban Sanitary Authority*, which was decided in 1892 by a Divisional Court of the Queen's Bench Division, consisting of Mr. Justice Wills and Mr. Justice Hawkins. This raised the precise point in issue in the present case. The tramway in that case was a tramway running through the streets of Swansea, which was continuous with what was known as the Oystermouth Railway, which was a railway constructed under the powers 44 George III. c. lv., upon land belonging to the company. It was admitted that the company were entitled to the exemption with regard to the Oystermouth Railway, but the sanitary authority contended that that exemption did not apply to the tramway. The court upheld this view. I entirely adopt the language of Mr. Justice Wills in his judgment in that case, where he says: "The objection which has been taken on the part of the Urban Sanitary Authority, and which, in my opinion, is a good one, is that tramways are something essentially different from railways, and that in the legislation of 1875 where railways are spoken of, they cannot possibly be supposed to include tramways. The legislature, when it passed that Act, did not think it necessary to define a tramway, and as definition is always *periculosæ plenum opus aleæ*, I shall follow the example of the legislature, and not attempt to define either railway or tramway. It appears sufficient to say that no ordinary person has any difficulty in distinguishing between the two. It seems to me, therefore, that the exemption in favour of railways cannot have been intended in the Act of 1875 to cover tramways."

The decision in this case remained unchallenged until it was overruled by the decision of the Court of Appeal, from which the present appeal is brought.

I now turn to the matters out of which, in my opinion, any difficulties that exist in the present case have arisen. In the year 1896 the legislature passed the Light Railways Act, 1896. Its full title was: "An Act to Facilitate the Construction of Light Railways in Great Britain." It established a board of three Commissioners, who were to receive applications for powers to construct light railways and to make Orders therefor, which upon confirmation by the Board of Trade were to have the same effect as if enacted by Parliament. With the exception of certain Acts specially named in the Act, and to any special provisions contained in the Order authorising the railway, it was provided that "the general enactments relating to railways shall apply to a light railway under this Act in like manner as they apply to any other railway." It is clear from this language and from the language of other portions of the Act that the legislature intended these light railways to be, and to be treated, as railways in the full sense of the word, though exempted from many of the obligations of railways, and entitled to special privileges. These special privileges were very great, and, indeed, if the Commissioners thought fit, they might make them exceptionally so, because the powers of the Commissioners with regard to the terms on which the railways should be authorised were subject to very few restrictions. In many ways these light railways were also exceptionally favoured. The Treasury might make loans for their construction, or even special advances in the nature of free grants. Persons with power, either by statute or otherwise, to sell and convey land for the railway might, with the sanction of the Board of Agriculture, do so wholly or partially without payment of its value. The provisions for assessing the compensation for lands compulsorily taken differed from those up to that time applicable to the compulsory acquisition of land, and were exceptionally favourable to the promoters of the railway, and in other respects the statute shows that the legislature intended to place these light railways in a highly-favoured position in order to stimulate their construction.

Now, there is not the slightest justification for viewing the Light Railways Act, 1896, as indicating or expressing any change of policy on the part of the legislature with regard to the treatment of tramways. It is evident, from a perusal of the Act, that what the legislature sought to facilitate thereby was the construction of railways for the purpose of opening out agricultural districts or other isolated centres of production, and bringing them into communication with the towns and the general railway system of the country. Unfortunately this, which is the plain object and intent of the Act, has not been adhered to. Tramway promoters were astute enough to see that undertakings which were purely and simply schemes for the construction of tramways in the ordinary sense of the word might be put forward under the guise of being schemes for light railways, and that if they could successfully elude the vigilance of the authorities they would thereby gain for the tramways the exceptional privileges intended only for undertakings of a widely different character. In this attempt they were only too successful, and by reason of what I have no hesitation in regarding as an abuse of the Act, schemes were sanctioned under the authority of the Light Railways Act, 1896, for the construction of what ought to have been regarded as tramways, and subjected to the carefully-considered conclusions of the legislature in respect thereto which are embodied in the Tramway Act.

The undertakings so sanctioned have secured irrevocably the status and privileges of light railways, however little they have merited it. But the lines to which the present case directly relates are not in this position, because they were constructed under Tramway Acts, and therefore it is only indirectly that this House is concerned with what has been done under the Light Railways Act, 1896. It has, however, become necessary for me to refer to that Act as I have done because of two decisions of this House upon which respondents' counsel relied strongly—namely, *The Blackpool and Fleetwood Tramway Company v. The Thornton Urban District Council*, and *The Wakefield and District Light Railways Company v. The Wakefield Corporation*, and I shall now proceed to examine these decisions.

In *The Blackpool and Fleetwood Tramway Company v. The Thornton Urban District Council*, the question to be decided was whether a tramroad which was placed on raised rails laid on sleepers, and was constructed on land the exclusive property of the company, and which was fenced off from adjoining land except at the level crossings of roads, was entitled as a "railway" to the benefit of the exemption. It was constructed under Acts which incorporated the Lands Clauses Act and large and important portions of the Railway Clauses Consolidation Act, 1845, and for the purposes thereof the tramroad in question was to be deemed a railway, and the company was to be deemed a railway company. So much for the nature and legal status of the tramroad. But the undertaking also included a tramway, and so far as that portion was concerned, and that only, certain provisions of the Tramway Act, 1870, were also incorporated. My only difficulty with regard to this case is how there could be any doubt that this tramroad was entitled to the exemption given by section 211 (1) (*b*) of the Public Health Act, 1875, on the ground of being a railway within the meaning of that section.

Digitized by Google

Lord Macnaghten, who delivered the judgment of this House, deals with it very plainly and very briefly. He treats it as a case of *Res ipsa loquitur*. "Would anybody," he says, "seeing this road or way, or the photographs of it which are in evidence, call it anything but a railway?" He then points out that the Parliamentary powers under which it was constructed support its claim to the status of a railway, as they undoubtedly did. The only assistance that, in my opinion, this decision gives to your Lordships in the present case is that it is impossible to read Lord Macnaghten's opinion without realising that that eminent judge did not think that what is popularly known as a tramway was a railway, otherwise he would not have appealed to the photographs of the line or asked the question what it would ordinarily be called, nor would he have troubled himself as to the form of the statutes under which it had been constructed.

The case of *The Wakefield and District Light Railway Company v. The Wakefield Corporation* raised directly the difficulties caused by the use of the Light Railway Act, 1896, for the purpose of constructing mere tramways. The railway in that case was structurally and functionally a mere tramway, but the Court of Appeal and this House held (as they were compelled to do) that the line so constructed had the legal status of a railway, and must be treated as such. Its right to enjoy the exemption given to railways by section 211 (1) *(b)*, turned, therefore, on the answer to be given to the question whether the "land" which it occupied was occupied solely as a railway constructed under Act of Parliament for public conveyance. This House held that it was so, holding that the words above cited referred only to the user by the railway company, which of course was solely for the purpose of their railway. The same result might have been arrived at in another way. The "land" occupied by the tramway is only that portion of the soil which is occupied by its rails, etc., though no doubt it has the right of support from the subjacent land. I doubt whether any other person but the railway can be legally held to occupy the land taken up by the rails, etc., and therefore I do not think it would be legally incorrect to say that the "land" occupied by them was in fact exclusively occupied for that purpose—a construction which would avoid difficulties that might arise in other cases from reading into the proviso a meaning which would give to all occupiers of land the privilege or the exemption—provided only that so far as the land was occupied by a railway it was occupied by the railway company solely for the purposes of the railway. But however we arrive at it, the conclusion is the same—namely, that seeing that the light railway is a railway, and that it has no occupation of the public streets or the subjacent land save for the purpose of the railway, it is entitled to the exemption. This decision, however, cannot affect the present case, where the subject of taxation is not a railway, but a tramway, constructed under Acts which are specifically Tramway Acts, and subject to the privileges and disabilities given to tramways by the public legislation relating to them.

There remains only one head of argument—standing entirely by itself—which must be noticed, and which at first appeared to possess great weight. The Tramway Act, 1870, applies to Scotland. Now, the cases quoted on behalf of the respondents show that tramways in Scotland are valued by a functionary known as the railway and canal assessor, a fact which at first sight would appear to show that in Scotland tramways possess the legal status of railways, and are treated as such. If this were the case it would give weight to the contention that they ought to be so treated in England, and to enjoy the exemption as to rating granted to railways.

But when the matter is looked into more closely it assumes a very different appearance. The rateability of tramways in Scotland was established by a decision which rested not upon their being railways, but (as in England) upon their being in occupation of land. It is true that in consequence of that decision tramways came to be valued by the railway and canal assessor, but this did not imply that they were recognised as having the legal status of railways, because the functions of the railway and canal assessor are not confined to valuing railways and canals. He can be called upon to value water companies, gas companies, and any other concerns which traverse more local units than one, and seeing that he has such special experience, he is evidently the most suitable person to value such a subject as the continuous route of a tramway. But the matter in Scotland was put into a position still more widely different to that in which it stands in England by the Burgh Police Act, 1892, applicable only to Scotland, which, by section 347, expressly provides that railways and tramways *eo nomine* shall be entitled to the three-fourths reduction. This does not apply to counties where both railways and tramways are rated at their full value, nor does it apply to parishes where there is a power of classification of property subject to the rate which is not governed by any such rule, and inasmuch as the Act does not apply to England it is immaterial to the decision of the present case.

For all these reasons I am of opinion that in public legislation the word railway does not include tramway unless it is expressly made so to do by the terms of the Act. To hold otherwise would be to put tramways under the exclusive jurisdiction of the Railway and Canal Commissioners, a thing which has never been suggested during the 40 years of the existence of that court, and is obviously contrary to the intention of the legislature in creating it. The word "tramway" has had both popularly and legally a distinct meaning for at least 40 years, and although the action of the Light Railways Commissioners may have produced some confusion, and has certainly led to the exemption being obtained in cases in which it was not merited, this cannot affect a case like the present, where the subject of taxation is neither legally nor popularly a "railway." I am of opinion, therefore, that the appeal should be allowed, that the judgment of the Divisional Court should be restored, and that the respondents should pay to the appellants their costs here and in the court below.

The judgment of the Court of Appeal was, therefore, reversed, and the respondents were ordered to pay to the appellants their costs in the House of Lords and in the court below.

## CROYDON AND OMNIBUS COMPETITION.

PROBABILITY OF RATE-AID NEXT YEAR—REQUEST FOR LEGISLATION.

Mr. T. B. Goodyer (manager of the Croydon Corporation Tramways) has forwarded to over 70 members of Parliament representing constituencies in and adjacent to the metropolitan area, and also to the members of the Parliamentary Labour Party, copies of the resolution unanimously passed by the Croydon Corporation, urging the Government to pass such legislation as will place motor omnibus companies on terms of equality with regard to public obligations with the municipal tramways authorities. The letter also states:

The municipal tramways authorities in the area named have expended, practically, 13½ millions of pounds on their undertakings, and when I tell you that next year there is every probability that each undertaking will require aid from the rates—instead of being self-supporting, as hitherto—you will, I trust, readily see how very serious the present outlook is for those ratepayers in the metropolitan area whose tramways are municipally owned. The metropolitan tramways managers desire, not that their undertaking shall have any preferential treatment, but that motor omnibus operators should be placed on terms of equality with regard to the public burdens now borne by the tramways in the area named. May I express the hope that it will be possible in the interest of the ratepayers concerned—for you, and the party you represent, to co-operate with other Parliamentary representatives in urging the Government to pass such legislation as will prevent the already over-taxed ratepayer from being further burdened?

Enclosed with the letter was the following extract from Mr. Goodyer's report on the Croydon tramways for the year ended March 31, 1913:

COMPARISON OF PUBLIC BURDENS BORNE BY TRAMCARS AND MOTOR OMNIBUSES IN CROYDON.

| Items. | Car. | Omnibus. |
|---|---|---|
| | £ s. d. | £ s. d. |
| Licence duties ... ... ... ... ... | 2 15 0 | 5 18 0 |
| Rates on track ... ... ... ... ... | 43 8 9 | — |
| Maintenance of road ... ... ... ... | 92 11 9 | — |
| Petrol tax ... ... ... ... ... | — | 43 0 0 |
| Total ... ... ... | £138 15 6 | £48 18 0 |

In addition to the above payments, the Croydon cars for the past year have contributed £3,000 towards the rates, or an average per car of £51 14s. 6d., thus making the sum of £190 10s. per car run, or a gross total of £11,095 16s. 7d. as a contribution to the local revenue, while the contribution of the 'buses is *nil*.

ADDITIONAL NOTES RELATING TO LOCAL EXPENDITURE BY CROYDON CARS FOR THE YEAR ENDED MARCH 31, 1913.

The amount paid in wages was £32,264 (including the wages paid to permanent way men in roads department), or 35·63 per cent. of the revenue earned (£90,543).

Out of every 20s. earned 7s. 1½d. has been spent in wages.

No doubt the greater part of this sum would be expended locally in house rent, tradespeople, etc.

The permanent way expenses and the rates and taxes represent respectively 5·93 per cent. and 2·61 per cent. of the revenue earned.

HOW TRAMCARS IN THE METROPOLITAN AREA ARE HANDICAPPED IN COMPARISON WITH THE OMNIBUSES.

| | Tramcars. | Omnibuses. |
|---|---|---|
| Control ... | Only permitted to run on routes sanctioned by Parliament. | Free to go anywhere at their option. |
| Track ... ... | Provided and maintained by the system. Damage done by motor 'buses and other traffic repaired at cost of trams. | Provided and maintained by the rates. Repairs paid for by the general ratepayer. |
| Workpeople's fares. | On all routes ... ... ... | None. |
| Rates on track | Pays rates on track ... ... | None. |

Digitized by Google

It will be observed from the foregoing that omnibuses operate under conditions of unmatched freedom from every point of view. A tramway, which is a statutory undertaking, constructed under conditions necessitating a heavy capital expenditure—afterwards, burdened by yearly charges, and having to comply with the Board of Trade conditions—is heavily handicapped in having to compete with another system, contributing largely towards the wear and tear of the various roads in the borough over which it runs, but making no payment *whatever* towards the maintenance of such roads, or local burdens. Tramways, also, are under statutory obligations to provide exceptionally cheap fares for their workpeople's services, thereby benefiting employers as well as employees. The provision of such facilities, in all cases, may be said to result in a serious loss. The motor omnibus has no obligation to give similar facilities—yet which are requisite—has no legal liabilities in connection with road maintenance, and is subject to no rates other than those for buildings and garages which are occupied. Those who use the roads for the benefit of shareholders should pay for the upkeep of those roads Tramways pay more than their fair share of the cost of road maintenance by reason of the obligation that rests upon them to make good and maintain the permanent way, which they only technically "use," and the width of the paving each side of the track. In addition, they are also called upon to pay the equivalent of a rent for the use of the roads in the shape of a substantial contribution for rating.

Legislation, therefore, in the interests of the ratepayers and those municipal authorities in the metropolitan area who have invested 13½ millions of pounds in their tramway undertakings is very urgently required, so that services provided by the community, at the cost of the community and in the interests of the community, should not be in a *less* favourable position than other competitive means of transport. Fortunately, valuable precedents in respect of contributions towards road maintenance by the operation of motor omnibuses and trackless trolley vehicles, have already been established in the following instances. Mr. Goodyer here cites the Chesterfield Corporation's Motor Omnibus and Trackless Trolley Bill and the Rhondda Tramways Company's Trackless Trolley Bill dealt with in May last. In the first case a House of Commons Committee required a clause to be inserted in the bill in order to render the Corporation "liable for damage arising out of the extraordinary traffic proposed by the bill, such damage to be assessed, at the end of three years, by arbitration." In the Rhondda bill a clause was inserted requiring the promoters "to pay a fixed sum per car-mile towards the maintenance of the roads upon which such vehicles shall be run."

The question of principle having at last been determined, as in the cases mentioned, the matter should, obviously, Mr. Goodyer states, be carried a step further and applied to the metropolitan area, where the local authorities have no control over the licensing of public vehicles.

## NEW AND PROSPECTIVE WORK.

BELFAST.—The Corporation have decided to apply to the Local Government Board for sanction to a loan of £35,000 for the extension of the electricity undertaking.

CALCUTTA.—In reply to a request by Calcutta Council for extension to the tramways in five directions in the southern part of the city, the Tramways Company have stated they understand that the Calcutta Improvement Trust have under consideration several schemes for the widening of the existing, and opening out of new roads, and are dealing with the question of the future expansion of the city generally. The company suggested that the proposals of the Corporation should be referred to the trust for an expression of opinion as to the advisability of constructing the tramway extensions referred to. The Council resolved to press the proposals upon the attention of the Improvement Trust in view of the provisions in their Act enabling them to subsidise tramway companies.

CARDIFF.—On the recommendation of Mr. A. Ellis, the electrical engineer and tramways manager, the Finance Committee have advised the Corporation to borrow £30,000 for the purpose of purchasing new plant and machinery at the power-station.

SOUTH SHIELDS.—The Town Council have adopted a recommendation to borrow £30,000 for the purpose of installing a new generator set and other plant at the electricity works.

WELLINGTON. — The tramways department's estimate for the current year provide for an expenditure of £34,800 on new works, including £9,264 for new cars, £5,020 for a new boiler and other plant for the power station, and £5,164 for car shed extension.

WEST HARTLEPOOL.—A plan for an extension to the tramway car shed has been adopted, and the manager has drawn up a memorandum for the approval of Mr. J. F. C. Snell, the consulting engineer, of suggested alterations and renewal of plant. On July 2 the Council approved of the suggested alterations to the car shed, the purchase of four new cars, and a rail-grinding equipment On the preceding day a Local Government Board inquiry was held into an application to borrow £4,300 for the purchase of new plant for the electricity works in connection with the supply of current to the tramways.

## FINANCIAL REPORTS AND MEETINGS.

**Millar's Timber and Trading Company.** The directors recommend a dividend of 5 per cent. on the ordinary shares.

**Provincial Tramways Company.**—The board have declared an interim dividend of 8d. per share on the ordinary shares for the past half-year.

**Blackpool and Fleetwood Tramroad Company, Limited.**—The board have declared an interim dividend at the rate of 4 per cent. per annum.

**Mexico Tramways.**—The directors have declared a dividend of 1¾ per cent. on the issued capital stock of the company, payable August 1 to shareholders of record July 12.

**Torquay Tramways Successful Working.**—For the first half of the year the traffic returns of the Torquay Tramways Company show an advance of £1,200 over the corresponding period last year.

**Chatham and District Light Railways.**—The following dividends are recommended by the directors for the half-year ended June 30: At the rate of 5 per cent. per annum on preference shares, and at the rate of 3 per cent. per annum on ordinary shares.

**Dublin United Tramways Dividend.**—Ad interim dividends at the rate of 6 per cent. per annum, less income tax, on the preference shares, and at the rate of 6 per cent. per annum, less income tax, on the ordinary shares for the half year to June 30 have been declared.

**The Railless Trolley Service at Bradford.**—The railless trolley car installation on the outskirts of Bradford produced an income for the year ended March 31 of £1,233, representing 7d. per car-mile; while the expenditure (£1,613) represented 9d. per car-mile. There was therefore a deficit of £380, or of 2d. per car-mile run. It is pointed out, however, by the city treasurer that the railless section is a feeder of the general tramways system and contributes to some extent to its profits.

**Electric Construction Company.**—At the annual meeting of the Electric Construction Company in London, on July 15, Mr. P. E. Beechcroft, who presided, said the net profit had increased from £20,364 to £27,500. Their works had been fully employed, and better prices had prevailed. They had been able to handle an increased output at comparatively little additional cost in the way of fixed factory charges. It was proposed to pay a dividend of 5 per cent. on the ordinary shares, and transfer £10,690 to the reserve, leaving to be carried forward £6,899. The report was adopted.

**London Electric Railway Dividends.**—For the past half-year: Metropolitan District, at the rate of 2½ per cent. per annum on the 5 per cent. second preference stock; London Electric Railway, at the rate of 1 per cent. per annum on the ordinary stock; Central London, at the rate of 3 per cent. per annum on undivided ordinary stocks, and at the rate of 4 per cent. per annum on the prefered ordinary stock; City and South London, at the rate of ¼ per cent. per annum on the ordinary stock; Underground Electric Railways, full distribution on the income bonds at the rate of 6 per cent. per annum.

**Cape Town Consolidated Tramways and Land.**—A balance of £1,678 is shown to the debit of profit and loss account for the current year, which, added to the balance brought forward from 1911 of £4,628, makes a total of £6,306 to be carried forward. No dividends have been declared by the subsidiary companies during the past year. The Camps Bay Tramway Company shows a profit of £2,973 for the same period. The Cape Provincial Government has taken the initiative in formulating a scheme for the unification of the municipalities of the Cape Peninsula—such unification will, in all probability, embrace Camps Bay. The whole matter is now under negotiation.

**The Purchase of Perth (W.A.) Electric Tramways.**—At an extraordinary meeting of the Perth Electric Tramways, Limited, Mr. O. Wethered presiding, the shareholders passed a resolution winding up voluntarily, to enable the directors to carry out the sale of the property to the Government. The chairman said there would be no difficulty in at once making a distribution, probably £1 per share, the distribution of the balance of the assets following as soon as the necessary details of the liquidation are carried out. Mr. Stoneham, the chairman, who seconded, said that the Government had made a good bargain, and as they had raised the loan at a little over 4 per cent., if they carried on the tramway as the company had carried it on, they would no doubt be receiving something like 10 per cent. upon their money.

**A Record Year at Birkenhead.**—Mr. Cyril Clarke, acting tramways manager for Birkenhead, in his annual report, states that all previous records as regards passengers carried, traffic receipts, and net profit, had been broken. The traffic receipts showed an increase of £1,908 over the previous year, which was gratifying considering that the year ending March, 1912, showed an increase of £2,565. The net profit of £4,301 had been placed to renewals fund account. The amount to the credit of this account was now £18,070, equivalent to

E—Electric trolley system. H—Horse lines. (a) Including 9,417 miles coal haulage. (b) Total expenses per passenger.
(c) Includes tramway operating cost only, excludes cost bulk supply to lighting department.

Digitized by Google

4·9 per cent. of the total capital outlay. The profits from the tramways had during the past 12 years provided for interest and sinking fund charges a total of approximately £234,460, being £117,842 towards the reduction of the debt incurred on the tramways, and £116,618 towards interest on capital.

**General Electric Company.**—Presiding at the annnal meeting of the General Electric Company in London on July 10, Mr. H. Hirst said that the net trading profits and income from investments for the past year amounted to £145,260, against £133,567 for 1911-12, to which must be added the balance brought forward, which gave them a total of £177,311 to be dealt with, against £145,777. They proposed to pay this year 10 per cent. on their ordinary shares, against 7½ per cent. last year. Certain of their manufacturing departments, producing specialities, had been turned, for purposes of policy, into separate companies, so that they could take as partners experts in specific lines. Their investments under that heading amounted to about £100,000. There was an ever increasing demand for electrical power for use in small and big industries; they were on the threshold of a big development in electrical heating and cooking, and the electrification of railways was coming fast.

**Lanarkshire Tramways Company.**—The traffic receipts for the half-year to June 30 last show an increase of £6,314, and the expenses an increase of £3,182, as compared with the corresponding half-year of 1912. Including £1,577 brought forward, the disposable balance is £17,383, out of which it is proposed to declare a dividend on the issued share capital at the rate of 6 per cent. per annum for the half-year, carrying £7,093 to revenue new account. For the first half of 1912 the dividend was 5½ per cent. per annum. A service of motor-'buses was inaugurated during the half-year, and commenced running in April between Newarthill and Cleekhimin, but the result so far, from the company's point of view, has not been satisfactory. The Lanark County Council are proceeding with the construction of tramways from Uddingston to Bellshill, Mossend, and New Stevenston. It is anticipated that part of the tramways will be in operation by the end of August and the remainder by the end of October. These tramways will be leased to the company.

**Cardiff Tramways Report.**—The Tramways Committee regarded as very satisfactory the report on the working of the tramways for the year ended March 31 last, presented to them on July 11. The total income was £150,626, £5,702 in excess of last year. Of the £20,326 surplus of income over expenditure (an increase of £1,803), £6,946 had been contributed to the depreciation account, £9,400 for the relief of rates, equal to 2d. in the pound, leaving £3,979 in hand. During the past two years £18,700 had been transferred to the relief of the rates, which more than wiped out the amount taken from the rates during the year ending March, 1992, while the work of reconstruction was proceeding, amounting to £8,824. These results had been achieved despite the unsatisfactory summer last year, the industrial disputes—over £2,000 more was spent on coal owing to the increased price—and the increases in wages granted to the employees amounting to a substantial sum. The number of passengers was 28,305,277, an increase of 803,625, and the car-mileage had increased by 28,480 from 2,586,421 to 2,614,901.

**Coventry Corporation Tramways.**—The statement of accounts issued by the tramways department of Coventry Corporation covers a period of 15 months ending March 31, 1913, the full period since the Corporation acquired the tramways from the company. The report for the past 12 months shows that there was a total expenditure of £24,118 (or 5·822d. per car-mile), and the gross profit was £15,035 (or 3·629d. per car-mile). The total earnings were £39,153 (or 9·451d. per car-mile). The percentage of working expenses to receipts was 61·6. The gross profit for the three months ended March 31, 1912, amounted to £2,949, making a total gross profit for the 15 months of £17,984. This amount has been appropriated as follows: Interest, £10,379; sinking fund (eight months), £3,286; reserve in lieu of sinking fund for seven months, £2,875; balance, £1,443. The total capital expenditure stands at £211,298, and the Corporation have 15¼ miles of track and 40 cars. During 12 months the energy consumption for all purposes amounted to 1,533,212 units, the cost per unit being ·450d. The consumption per car-mile was 1·44 units. The total number of car-miles for the year was 994,207, and the car hours 154,919. The passengers amounted to 7,639,065. The population served is 135,000, and the average journeys per head averaged 57.

**Stalybridge Joint Tramways Loss: Heavy Motors and Track Repair.**—The Stalybridge, Hyde, Mossley, and Dukinfield Joint Tramways and Electricity Board have received a report that the loss on the year's working was £9,124, or £2,000 more than in the preceding year. Alderman Wood (Stalybridge), in moving adoption of Tramways Committee minutes, said that in 1906 they earned 6·04d. per mile, and last year 7·88d. On track and overhead equipment they spent £2,000. That sum included not only upkeep of the rails, but the pavement also. At the Tramways and Light Railways Association meeting a resolution was passed asking Parliament to do something in the way of asking the owners of commercial motors who carried heavy loads to pay something for the upkeep of the roads.—Mossley Council at their July meeting agreed to pay the sum of £2,281 as their share of the loss. Alderman Clark, chairman of the Tramway Committee of the Board, said the loss was due to unforeseen circumstances. Referring to complaints as to the cars causing passengers to miss trains, he observed that on a small system, and with single lines, they could not run cars as regularly as on one with double lines. After the last accident the shed at Mossley was closed on the recommendation of the Government inspector. It was better for the cars all to be at one shed, where they could be properly inspected before turning out. The Mayor said the bad year was chiefly caused by the tramwaymen's strike, the coal strike, the cost of coal, and the breakdown of plant. Their great difficulty was that they were only earning 8d. per mile when it should be 10d. The electricity department was doing fairly well, and would, he hoped, be able to give a helping hand next year.

**A Record Year at Aberdeen.**—Mr. R. S. Pilcher's report for the year ended May 31 last states that in the previous year the profit amounted to £11,158, but in the year under review the amount was £12,524, the largest profit yet obtained. The whole of this sum is available for the reserve fund, as sufficient is now being laid aside each year to meet future requirements for the renewal of the track; and this is the free surplus revenue that would be available if the Council receives from Parliament the power which they have resolved to ask —in any year to appropriate and apply a sum not exceeding one-third of the free surplus revenue of the tramway undertaking for that year to the Common Good of the city, or towards the reduction of the city rates, or in carrying out city improvements, as the Corporation may in their discretion determine. The reserve account of the undertaking amounts to £16,518; a sum of £126,949 stands at the credit of the depreciation and renewal account; while the sinking fund amounts to £41,905. The total revenue amounted to £80,166, an increase of £2,985, and the highest figure yet obtained. This is very satisfactory considering the wet summer of 1912. Working expenses came to £43,206, an increase of £2,236. This increase is mainly owing to the fact that 95,719 additional miles were run during the year. Interest, sinking fund, depreciation, and renewals absorbed £24,906, a decrease of £510 The increase in surplus or profit for the year amounted to £1,366. Six new cars were put into service, making a total of 77, of which 58 have top covers. The department will, however, require more cars to adequately deal with the growing traffic. Wind screens for the protection of motormen were erected on 50 top-covered cars during the year; the remaining cars will be fitted during the next year. These screens have been much appreciated by the motormen, amongst whom there seems to be much less illness since the screens were fitted. The manager's reference to the success of the P-A-Y-E cars is given elsewhere.

**Croydon Corporation Tramways.**—The report of the general manager, Mr. T. B. Goodyer, to the Tramways Committee, shows that the total receipts for the year ended March 31 amounted to £92,463, and the working expenses to £66,218. Including bank interest there is a gross balance of £27,153, a decrease as compared with the previons year of £6,434. After providing for interest on capital, £7,993; contribution to sinking fund, £7,428; and income tax, £1,145; there is a net balance of £10,586 (a decrease of £6,717). Of this sum £3,000 has been paid in aid of rates, and £7,586 has been transferred to the renewals fund. The gross balance is equal to 9 53 per cent. on the capital outlay, and the net balance to 3·72 per cent. The percentage of expenses to total revenue is 70·91. Unfavourable weather and motor omnibus competition, increased rates, increased power costs, due to the additional mileage, increased cost of permanent way repairs, etc., are mentioned in explanation of the decrease in the net results. The total receipts per car-mile were 8·46d., a decrease of ·85d. as compared with the previous year. The average profit per passenger has decreased from ·168d. in 1912 to ·087d. in 1913. The consumption of electrical energy was 2,484,993 units, an average of ·938 unit per car-mile, the cost being 1·505d. per car-mile (a reduction of ·049d.), while the average cost per unit is 1·604d. Mr. Goodyer's remarks on motor omnibus competition are given elsewhere in this issue. Councillor Denning, in moving the adoption of the report, said he wished to draw attention to a few other items. They paid in rates £2,500, and to the Roads Committee, for the maintenance of roads which the Tramways Committee did not touch, £5,370. To the Electricity Committee they paid £16,813, a large part of which must have been profit to that committee. Croydon had benefited from the tramway undertaking to the extent of £40,000. They had at the same time given a nineteen-and-a-half-hours-a-day service of cars, they had carried people for a halfpenny a mile, run workmen's cars at a charge considerably less than a halfpenny a mile. In addition, they had provided a two to five-minute service all over the system. They had, moreover, run the cars very quickly, and thus satisfied those who had used them. Councillor Denning added that he wished to endorse the paragraph of appreciation Mr. Goodyer had written with regard to the staff. People were struck with the civility and attention received from the conductors.

## MR. J. S. D. MOFFET.

Mr. J. S. D. Moffet, who has been appointed general manager of West Ham Corporation Tramways, was educated at the Hall School, Sunderland, the Heriot Watt Engineering College, Edinburgh, and the Durham College of Science, Durham University, Newcastle-on-Tyne. From 1890 to 1899 he served an apprenticeship in the engineering workshops of Messrs. George Clarke, Limited, Southwick, Sunderland. He was trained for the civil engineering profession under Mr. R. S. Rounthwaite, borough engineer of Sunderland, and for the last two years of that period was engaged as an engineering assistant. In 1899 he secured an appointment on the staff of Mr. S. S. Platt, borough engineer of Rochdale, and acted as chief engineering and tramways assistant up to 1904, during which time he was engaged in the promotion and construction of a big tramway and improvement scheme for that borough, involving an expenditure of £400,000.

Mr. J. S. D. Moffet.

In 1904 he was appointed general manager of the Rochdale system, and as the responsible engineer has carried out several large extensions for the Corporation. He has also acted in a consultant capacity for a number of other authorities in the promotion and construction of tramway and light railway schemes, and as an expert on tramway matters has given evidence before Parliamentary Committees, the Light Railway Commissioners, and in the Chancery Court.

As general manager he was responsible for the organisation and development of practically the whole of the Rochdale system from its inception, including the traffic, overhead equipment, permanent way, and administrative departments. During his period of office, the revenue of the undertaking increased from £15,000 to £80,000 per annum.

## THE BRISTOL TRAMWAYS AND THE CORPORATION.

Under section 43 of the Tramways Act of 1870, the Bristol Corporation have the option of purchasing the greater part of the tramways in the city, amounting to 25 miles out of a total length of 31 miles, on May 1, 1915. The Corporation, who are now considering the question of purchase, have found it necessary to obtain not only an estimate of the approximate value of the tramways but also of the probable results from the future working of the tramways either by municipal or private ownership. For this purpose the Corporation retained the services of Mr. J. B. Hamilton, general manager of Leeds Corporation Tramways, and Mr. J. F. C. Snell, consulting engineer of the firm of Messrs. Preece, Cardew, and Snell, and we understand that these gentlemen are at present completing a valuation of the tramways and preparing a report. When this has been received the Corporation will be in a position to decide whether they should go forward with a bill in the next session of Parliament to secure powers to work the tramways. Whether they should exercise such powers, if obtained, or allow the company to continue to work the undertaking would, of course, not require to be determined immediately.

## PERSONAL.

**Mr. I. Bulfin,** general manager of Bournemouth Corporation Tramways, has been granted an advance in his salary to £700.

**Mr. J. R. Taylor,** chief clerk in the Ashton tramways department, has been recommended for an increase of £13 per annum in his salary.

**Mr. H. H. Couzens,** late of Hampstead Electricity Works, took over the charge of the new hydro-electric installation at Toronto on July 1.

**Mr. W. M. Nelson** has resigned his appointment as engineer to the Christchurch (N.Z.) Tramways, and rejoined the Brisbane Tramways Company.

**Mr. R. H. Schofield,** who has been appointed sales manager to Ferranti, Limited, Central House, Kingsway, W.C., has been with the Ferranti Company nearly 20 years.

**Lieut.-Colonel F. G. Von Donop,** R.E., has been appointed Chief Inspecting Officer of Railways, in succession to Colonel Sir Arthur Yorke, R.E., C.B., who has retired under the age limit.

**Mr. L. C. F. Bellamy,** manager of Ilkeston Corporation Tramways and borough electrical engineer, was married on July 23 to Miss Eileen Leghorn at St. John's Church, Fairfield, Liverpool.

**Captain T. C. FitzHugh,** M.V.O., the Chief Commissioner in the Far East, recently appointed by the British Engineers' Association, has left London for Peking accompanied by his technical secretary, Mr. L. B. Stevens.

**Mr. A. Murdock,** electrical and tramways engineer to the Melbourne City Tramways, who recently returned to England on leave, has been staying at Blackpool, where he was formerly on the staff of the Corporation electricity works.

**Inspector J. Pearson,** of Glasgow Corporation Tramways, has been presented with the St. Andrew's Ambulance Association certificate of honour for bravery in stopping a runaway horse. But for his action some of the passers-by must have been injured.

**Mr. H. King,** late traffic superintendent of the Merthyr Electric Traction Company, has been presented with a testimonial recording the esteem in which he is held by the staff and employees Mr. King has been appointed tramways manager at Aberdare.

**Sir J. S. Harmood Banner,** M.P., Lord Mayor of Liverpool, who was knighted on the occasion of the King's visit, is a director of the British Insulated and Helsby Cables, Limited, the Midland Electric Corporation for Power Distribution, Limited, etc.

**Mr. Francis Husband** has resigned his position with the London County Council Tramways to take up the position of engineer and director with the Electrical Contracts and Maintenance Company, Limited, Sanctuary House, Westminster, S.W., as from July 1.

**Aberdare Tramways Appointments.**—The following members of the electricity staff have been appointed to positions in the electricity and tramways department: Mr. W. J. Williams, as works superintendent; Mr. W. T. Hilder, as outside superintendent; and Mr. G. D. Morgan as chief clerk.

**Mr. G. Webster,** who has been the Rochdale Corporation Tramways traffic superintendent for the last 10 years, has been recommended by the Tramways Committee for appointment as general manager, in succession to Mr. J. S. D. Moffet, now manager of the West Ham Tramways.

**Mr. Arthur Ellis,** the general manager and electrical engineer, and the staff of Cardiff tramways, were heartily praised for their work during the past year by Sir John Courtis, the chairman of the Tramways Committee, when proposing the adoption of the annual report on the working of the tramways.

**Mr. F. Buckley,** general manager of Wigan Corporation Tramways, was referred to in terms of praise by the employees at their annual outing, for his efforts to bring about a satisfactory solution of the question of improved conditions of employment. A resolution was passed thanking the Tramways Committee for their favourable response to the men's application.

**Mr. R. Cook,** for 11 years a conductor, motorman, and inspector on the Doncaster tramways, has been presented with a marble clock and bronzes by the electricity and tramways staff on his retirement to take up an appointment as wagon inspector at Bentley Colliery. Mr. G. A. Roberts, assistant engineer, made the presentation in the absence of the electrical engineer.

**Mr. J. Dalrymple,** general manager, Glasgow Corporation Tramways, sailed for New York on August 9 to visit the most important cities in America where tramways are in operation. Mr. Dalrymple is no stranger in America, for in 1904 he was specially retained by Chicago City Council to report on a proposed scheme for municipalisation In view of the proposal to construct a new bridge over the Clyde, the master of works of Glasgow is to visit places in America where different types of opening bridges may be seen.

**Mr. J. Barnard** has been unanimously appointed general manager of the Bolton tramways at a salary of £400, rising to a maximum of £600. Mr. Barnard was previously traffic manager. The vacant

Digitized by Google

position of engineer and manager of the electricity department has been filled by the appointment of Mr. W. J. H. Wood at a salary of £400, rising by annual increments of £50 to £600. Mr. Wood had previously held the position of station engineer.

**Mr. Butler** has been appointed engineer of tracks and tramways to the Government of Tasmania. At an inquiry held at Launceston on May 21 by the Minister of Lands and Works into applications for tramway improvements, the Minister said there had been some difficulty with the Public Service Board in creating the new office. The department's trouble was that they had more work than they had engineers for. It would take the engineer some time to organise his department.

**Mr. Alfred Clough,** resident electrical engineer to the Liverpool Tramways and Electric Power and Lighting Committee, acting under medical advice, has intimated his desire to retire from the service. The resignation has been accepted as and from October 1 next, and the commtttee have placed on record their appreciation of the services rendered by Mr. Clough to the Corporation and to the community in connection with the management and development of the electric supply undertaking.

**Mr. E. Goolding,** who has been for the past seven years in the electrical department of the London County Council Tramways, has rejoined the British Thomson-Houston Company, and sailed on July 24 for the Argentine in connection with railway electrification work. Mr. E. Goolding was with the British Thomson-Houston Company during the North Eastern Railway Company's electrification scheme, and previous to that he was in the electrical department of the Great Northern Railway Company.

**Aldermen J. Clark, J.P., and R. Wood,** the chairmen of the Tramways and Electricity Committees of the Stalybridge and District Joint Tramways Board, were referred to in terms of commendation at a meeting of the Mossley Council, Councillor Sykes remarking that the members of the Joint Board were proud of the two chairmen. Expressing a hope for a more successful future for the undertaking, he said that they had made application to borrow a sum of £25,000. An inspector held an inquiry, and many inquiries were made as to the management and general position. The opposition had been left without a leg to stand on. If they had had a better lead at the start and more expert advice they would have saved thousands of pounds. Another member bore testimony to the ability and diligence of Messrs. Schofield and Blackmore, the chief officers.

**Mr. P. H. Marco,** general manager, Barnsley and District Tramways Company, presided at the annual dinner given by the company to the employees. Alderman Rose, who proposed the toast of the Tramway Company, said it was to the untiring efforts of Mr. Marco that the present position of the company was due. He had grappled with a very difficult period and brought about great improvements. Mr. Marco, in response, expressed the regret of his chairman (Mr. E. Garcke) and directors (Colonel Sir Thos. Pilkington, Bart., and Mr. E. A. Paris) at their inability to attend. He gave the staff the whole of the credit for doing their work so thoroughly and so well, and said he fully appreciated the fine work of his departmental officers, viz.: Mr. A. Wood, traffic superintendent; Mr. A. Kenworthy, department superintendent; Mr. J. Cocking, chief clerk; and Mr. McFayden, permanent way superintendent. Mr. Marco also expressed his gratification at the employees having won the Lansdowne "Devonshire Challenge Cup" for the best health record amongst the 30 or 40 associated companies of the Federation, three times in four years.

**Farewell Dinner to Mr. E. P. Grove.**—On July 22 Mr. E. P. Grove was entertained at a farewell dinner at the Trocadero Restaurant by a large number of his friends, and presented with a handsome silver cup. Mr. Grove, who has been connected with the Central London Railway as chief engineer for many years, has now proceeded to Melbourne as resident engineer for Messrs. Merz and McLellan, and will superintend the important electric railway installation to be carried out there. Dr. H. F. Parshall presided at the dinner, and Mr. Frank Bailey and Mr. A. L. C. Fell, also associates of Mr. Grove in various undertakings, were among those present. The speeches were reminiscent of pioneer days in electrical power work, and some amusing incidents were related, which greatly entertained the company. In our photograph Mr. Grove is seated between Dr. Parshall and Mr. Frank Bailey, while Mr. Fell is on Dr. Parshall's left. The arrangements for the dinner were largely due to Mr. A. H. Walton, who was cordially congratulated on the enjoyable programme which was so well carried out.

**Farewell Dinner to Mr. E. P. Grove on His Departure for Melbourne.—Dr. H. F. Parshall Presiding.**

**Mr. H. E. Blain** was entertained with Mrs. Blain at a social evening on July 9, by the staff of the West Ham Corporation Tramways and their friends, prior to the late manager of the undertaking taking up his new appointment on the staff of the London Underground Railways and Allied Companies. Mr. Blain was presented with a large handsome silver-mounted polished oak case, containing a three-bottle tantalus, with accompanying glasses, a card outfit, and a smoker's compendium. The presentation was made by Mr. F. Eggington, the principal assistant, who expressed deep sorrow at Mr. Blain's departure, whilst heartily congratulating him upon his new appointment. Mr. Blain, in acknowledging the presentation, said that he would value the gift as a most kindly remembrance of ten years' work. He thanked Mr. Eggington and the staff for their support, and extended a hearty welcome to the new manager, Mr. J. S. D. Moffet, whom he described as a capable, straight, and courteous gentleman. Mr. Moffet, who was present with his wife, thanked the staff for their welcome, and appealed for their loyal support. Mr. J. W. Beauchamp, the borough electrical engineer, referred to the personal loss he felt in the departure of Mr. Blain, and Mr. W. C. Ullmann, tramways manager, East Ham, voiced the regret felt in tramway circles, and particularly amongst the managers of the metropolitan area, at the change Mr. Blain was making, but cordially wished him success. Mr. Blain has also been entertained at dinner by the Metropolitan Association of Tramways Managers, of which he is the late chairman.

## CONTRACTS AND ORDERS.

**Edgar Allen and Company** have received a contract for the supply of points and crossings to Southend Council.

**United Electric Car Company** have obtained the contract for supplying 14 top covers to Burnley tramways.

**Siemens-Schuckert, Limited,** have obtained a contract for the electrification of the Necochia (Argentina) tramways.

**Beecroft and Wrightman, Limited,** have received a contract to supply hard wood paving blocks to Bradford tramways.

**Mr. W. Dowling** has obtained a contract for the construction of a permanent way depot for the Belfast tramways, at £2,066.

**Walter Scott, Limited,** have been awarded a contract for the supply of Sandberg steel rails to Bournemouth tramways, at £5,535.

**Sturtevant Engineering Company, Limited,** are supplying a wet-air filter for turbo-generators to the Belfast electricity works, at £369.

**East Ham Council** have accepted the tender of Callender's Cable and Construction Company, at £55 10s., for the supply of a feeder pillar.

**Croydon Council** have accepted the tender of Le Grand and Sutcliffe, of London, for a deep-well pump for the electricity works, at £435.

**St. Helens Council** have awarded a contract to the British Westinghouse Electric and Manufacturing Company, Limited, for a rotary converter.

**West Ham Council** have accepted the tender of J. Baker and Company, of Rotherham, for supplying 32-in. steel tyres to the tramways department.

**Walthamstow Council** have placed a contract with the Blasberg Engineering Company for the erection of a natural draught cooling tower at the generating station, at £980.

**The Titan Trackwork Company, Limited,** have secured contracts from the Merthyr Tydfil Tramways, the Birkenhead Corporation Tramways, and the Pelotas Electric Tramways.

**Ramsbottom Traction Committee** have recommended the Council to accept the tender of the Lancashire Electric Power Company for a switchboard at the electricity works.

**Bolton Council** have accepted the tender of Newton, Chambers, and Company, Limited, for feed tanks, and that of Musgrave and Company, conditionally, for condensing plant.

**Commercial Cars, Limited,** of Luton, have orders in hand for motor passenger vehicles for Bath Electric Tramways, the Cheltenham Light Railway Company, and Grimsby Street Tramways.

**The Daimler Company, Limited,** have obtained a contract for the supply of spares and other accessories required for three motor omnibuses, to Rotherham tramways department, at £432.

**The M. and G. Truck and Engineering Company, Limited,** of 124 to 127, Minories, London, E.C., have received an order from Birmingham Corporation for maximum traction trucks for 75 cars.

**Regina City Commissioners,** Saskatchewan, have ordered from Bruce Peebles and Company, Limited, through that firm's Eastern Canadian agents, a 1,200-KW. motor converter (Peebles la Cour patents).

**Carlisle Council** have placed a contract with Pratchett Brothers for the supply and erection of a coal conveyor and bunker at £1,055, and with Babcock and Wilcox, Limited, for steam and water pipes at £395.

**British Thomson-Houston Company** have been awarded the contract for the supply of two 300-KW. rotary converters, with transformer switch gear, traction feeder, etc., to West Hartlepool electricity works.

**Leeds Tramways Committee** have recommended that the following tenders be accepted: 20 to 40 trucks for new cars, J. G. Brill and Company: 20 electrical equipments, with option to take a further 20, Dick, Kerr and Company.

**The Peckham Truck Company,** of Queen Anne's Chambers, Westminster, have recently received orders for two of their long wheel base radial trucks from the Liverpool Corporation Tramways, for use with the Mallins improved double-decked cars.

**Doncaster Council** have allotted the following contracts: Willans and Robinson, Limited, turbine and condenser, £3,308; British Westinghouse Company, Limited, one 350-KW. rotary converter, £1,074, and one 600-KW. rotary converter, £1,510.

**Newport Council** have accepted the following tenders: Switch gear (with British Thomson-Houston switches), Bertram Thomas; 100 tons of tramway rails at £7 15s. per ton, Walter Scott, Limited; rewinding turbo-alternator, General Electric Company.

**Walsall Council** have accepted the tender of the Harris Patent Feed Water Filter (1910) for a water softener for £345, and of Normans, Limited, for erecting a new steel and iron building for the additional boiler house at the electricity station for £307.

**Siemens Brothers' Dynamo Works** are supplying Tantalum traction lamps to Rochdale tramways, and have been awarded a contract for the annual supply of Wotan lamps for office lighting and of Tantalum lamps for car lighting to South Shields tramways.

**Keighley Council** have placed a contract with the Cedes Electric Traction Company, Limited, for a spare pair of hind wheels, with armatures complete, and a spare current collector and flexible wire to the disconnecting socket, for the railless trolley vehicles, at £123 10s.

**Stalybridge Joint Tramways Board** have accepted the following tenders in connection with the extensions to the generating station: Economisers, Goodbrand and Company; supply and erection of steelwork for boiler house, Ed. Wood and Company; feed water heater, Messrs. Babcock and Wilcox; weigh bridge, Ellis and Son.

**Manchester Council** have placed contracts as follow: Foundations and floor extensions at engine house, etc., for 15,000-KW. turbo-generator, William Gornall; for cable, W. T. Henley's Telegraph Works Company, Limited, B.I. and Helsby Cables, Limited, C. Macintosh and Company, Limited, and the Electrical Engineering and Equipment Company, Limited; supply of pitch to the tramways department, Simons-Carves, Limited.

**Sheffield Council** have awarded the subjoined contracts: Motor-driven surface condensing plant, capable of dealing with 75,000 lb. of exhaust steam per hour, £2,647, and 10 per cent. allowance for contingencies, and with a further allowance of £100 for the old condenser, British Westinghouse Company, Limited; hand travelling crane of 15 tons capacity, £375, Chatteris Engineering Works Company; direct-acting boiler feed pump, £190, J. F. Hall and Son, Limited.

**Glasgow Council** have been recommended to accept the following tenders: Special trackwork, Lorain Steel Company and E. Allen and Company; 10-ton travelling crane for Whitevale sub-station, Chambers, Scott, and Company; teak planks, J. Watt Torrance and Company, and Robinson, Dunn, and Company; mica, Micanite and Insulators Company, Limited; condenser for a new turbine at Pinkston power-station, Messrs. Willans and Robinson; engine, J. Jackson and Company. For the supply of tramway stores the following contracts have been made: E. W. Bliss Company and W. C. Yuille and Company, gear wheels; W. MacFarlane and Company, c.i. gutters; British Westinghonse Company, car equipments, motors, etc.; British Thomson-Houston Company, car equipments and controllers.

**St. Petersburg Tramway Extensions.**—On June 25 St. Petersburg Council awarded contracts as follow for the construction of new tramways during 1914-15:

(1) To the Kolomensk house for excavations, rectification of streets, and construction of the lines, if they accept the reduced price of 4,081,640 roubles (£425,500). Failing agreement with this offer, fresh tenders will be called for, and should these not induce lower offers, the work will be done under the direction of the town. (2) To the A.E.G. for the construction of the cable ways and cable systems at 1,229,000 roubles (£130,000), and for aerial cables at 1,164,326 roubles (£123,000), and for the equipment of the Poleustrovsky sub-station if the house will accept 101,651 roubles (£10,700), failing which the order will go to the Dynamo Company. (3) To the Dynamo Company for the supplementary equipment of the St. Petersburg and Podyatchesky sub-station at 115,000 roubles (£12,200).

As to the rolling stock orders already published, there is likelihood that the order for trailers will be withheld from the Swedish house, and given to a Russian one, owing to the protests raised against the order going abroad. The difference in favour of the Swedish tender is 47,000 roubles (£5,000) on a total of 1,026,000 roubles (£108,000). The Russian Metallurgical Combine, Prodameta, will supply the rails at a maximum of 1,250,435 roubles (£132,000), and the house of Pomerantr will supply the sleepers at a cost of 218,381 roubles (£23,100).

**London County Council** have accepted the following tenders: Stern Sonneborn Oil Company, cylinder oil for Greenwich power-station up to May 31, 1914, 1s. 5½d. a gallon, less 2½ per cent. monthly discount; C. Price and Company, machinery oil for Greenwich power-station, £11 10s a ton; W. Cory and Son, Limited, removal of ashes from Greenwich power-station for one year from August 1, 1s. 3d. per cubic yard; W. T. Henley's Telegraph Works Company, Limited, 880 yards of low-tension vulcanised bitumen insulated cable, £212 13s. 4d.; British Insulated and Helsby Cables, 50 cwts. of D.C.C., H.C.C. wire, £221 13s. 4d.; Electric Construction Company, charging apparatus for electrically-driven fire appliances at Hammersmith fire station, £158; Babcock and Wilcox, 50-ton overhead travelling crane for Greenwich power-station, £2,285; Burt, Boulton, and Haywood, 50,000 creosoted deal paving blocks required in connection with the diversion of tramway tracks in Wood Lane, delivered by van on the site, £7 6s. 10d. per thousand, total, £367 1s. 8d. The Highways Committee have reported, without mentioning the names of the firms, that they have arranged for the purchase of 100 cast steel wheel centres at the cost of £216 18s. 9d., and 1,000 plough leads and 3,500 sliding contact plough leads, at a cost of £518 15s.

**Bradford's Rolling Stock Requirements.**—For the year beginning April 1, 1914, the Tramways Committee propose to expend the following sums on rolling stock: 50 trucks, £4,050; 100 motors, £10,600; 50 resistances, £412; 100 circuit breakers, £215; 100 controllers, £2,400; 50 power brake sets, £2,500; 50 sets power circuits, £875; 10 car bodies rebuilding, £2,250, total £23,302, less £2,500 value of old equipment.

## TRAMWAY AND LIGHT RAILWAY NOTES.

**BRIGHTON.**—As many visitors do not care to pay a shilling to go round in a tourist car, it has been decided to issue visitors' tickets for a journey round the Beaconsfield Ditchling circular route, and, in addition, to either the Dyke Road terminus or the Race Hill, or Queen's Park terminus and back, at a combined charge of sixpence.—On the recommendation of the manager, the Tramways Committee advised the Council to apply to the Board of Trade to change several compulsory stops to optional stops, several being on descending journeys. The Council, however, referred the report back for further consideration.

**GLASGOW.**—The three tunnels under the Clyde which were closed in 1907 owing to ferry boat competition immediately above the line of the tunnels, were reopened for traffic in July. There are three tunnels, two feet apart, all on the same level under the Clyde. The centre tunnel is intended for passenger traffic only, and meantime will not be in use. The west tunnel is used for north-going traffic, and the east for south-going traffic. There are six lifts in each shaft, but generally four lifts only are operated and one kept spare. An agreement has been arranged between the Tunnel Company and the Corporation for the reopening to take place for one year, with an option to the Corporation to purchase the undertaking for £100,000. Members of the Statute Labour Committee and the Tramways Committee attended the opening ceremony, and made an inspection of the works under the guidance of Mr. J. Dalrymple, the tramways manager, and the company's officials.

**HUDDERSFIELD.**—In order to secure an extension of the Huddersfield tramways to Elland and West Vale, the local authorities have agreed to pay £2,350 towards the cost of widenings. In return for this offer the Corporation have withdrawn a stipulation that Elland should pay £100 per year for five years in the event of the tramways resulting in loss.

**LONDON.**—Early last year the County Council, acting on their statutory powers, framed by-laws, which were approved by the Board of Trade, relating to the use of special cars for special purposes. At the meeting of the Council on July 15 the Highways Committee reported that the by-laws had now been amended so as to provide for the imposition of a penalty for their contravention, and that the Board of Trade had allowed such amendment, providing among other things that no male person shall, unless duly authorised by the Council, board any tramcar which is run and reserved for female persons only, under liability to a penalty not exceeding 40s. on conviction. The need for the amended by-law has arisen in connection with the early morning cars for women.—Owing to the large number of cars now being fitted with trolleys and plough collectors for through running on other tramways and on mixed systems on the Council routes, authority has been given for obtaining tenders from selected firms for the supply of 1,000 ordinary leads and 3,500 sliding contact leads.—Authority was given to the Highways Committee on July 5 to advertise the facilities afforded by the tramways by means of illuminated advertisements on certain tramway buildings and other sites, and to obtain tenders from selected firms for the provision of the signs required.—In order to relieve the congestion of traffic near Rye Lane, the County Council have agreed to install a tramway lay-by in Harders Road, Peckham, at an estimated cost of £2,250.—Arrangements have been concluded for repairing, at the cost of the London County Council, the West London lines of the London United Tramways Company which are within the county boundary. These lines are about to be taken over by the Council. The cost of the work at present arranged for is £19,700, but the total expenditure contemplated for the reconstruction of nearly eight miles single track is £51,800.

**MANCHESTER.**—The Tramways Committee, on July 22, received a petition containing 3,553 signatures in favour of an all-night service of tramcars or motor omnibuses. Dr. Chapman, the vice-chairman, stated that Mr. McElroy, the manager, was a short time ago instructed to submit a report on the question, but owing to his visit to America had not yet been able to do so. The committee, immediately on receipt of Mr. McElroy's report, would take the matter in hand. "Members of the committee," Dr. Chapman said, "are deeply interested in this matter, and you may depend upon it that if a night service can be put on it will be."

**MIDDLESEX.**—Acton Council have referred to committee a proposal by the Middlesex County Council to link up their tramways with those of the London United Electric Tramways Company.

**MORECAMBE.**—The Tramways Committee have instructed the borough electrical engineer to prepare an estimate for the electrification of the horse tramways.

**PORTSMOUTH.**—Great interest was displayed at Portsmouth at the opening of an extension of the tramways from the Recreation Ground and Commercial Road on July 4. The decision of the Council to construct tramways to the populous district of Stamshaw was mainly due to the efforts of Councillor J. Timpson, vice-chairman of the Tramways Committee, whose health was proposed by the Mayor

(Alderman J. H. Corke), the chairman of the committee, during a few speeches following the inaugural ride. Mr V. G. Lironi, the electrical and permanent way engineer, at the request of the Mayor, described the work connected with the extension, which has cost £10,750, and details as to the service to be run were given by Mr. W. R. Spaven, the manager. Councillor Timpson paid a tribute to the work of Mr. Spaven, Mr. Lironi, and Mr. Roscoe, the assistant electrical engineer, and Mr. Lewis, the civil engineer.

**READING.**—A report has been presented to the Council recommending a tramways extension of about a quarter of a mile, and four trackless trolley routes of slightly more than eight miles total length, with a further provision for motor omnibuses for trying new routes. The total cost of the scheme is over £26,000, and the Council decided to consider it in committee.

**SWANSEA.**—The Light Railway Commissioners have granted an Order for the construction of tramways on Town Hill as recommended in a scheme prepared for the Town Council by Mr. Stephen Sellon. The object of the proposal is to develop Corporation lands for the provision of workmen's and other dwellings.

## LONDON TRAMWAYS RENEWAL FUND.

NO SUM AVAILABLE—QUESTION ADJOURNED FOR TWO YEARS.

At the meeting of London County Council on July 8 a special report of the Highways Committee on the tramways renewal fund and general reserve fund was adopted. The report pointed out that on June 23, 1908, the Council decided that provision should be made for renewals in respect of the tramways undertaking at the rate of two-thirds of a penny per car-mile, and that the question of the adequacy of this provision should again be considered at the expiration of five years. The provision of two-thirds of a penny was the result of a careful computation based on the lives of certain parts of the undertaking, consisting of the permanent way, cables, machinery at Greenwich station, petrol motor cars, petrol lorries, steam lorries, ticket vans, cable vans, and sundry horse vehicles. No provision was made in respect of renewal of cars, car traversers, cable ducts, tracks in the car sheds and foundations for the permanent way and the renewal of certain sub-station machinery, switch gear, and sundry plant and tools, as work of this nature is paid for directly out of revenue. Of a total expenditure to March 31 last of £7,521,036 on items the repayment of which was spread over 25 years, only about £2,974,000 was covered by the renewals fund, the remainder being renewed out of revenue account.

The recent falling off in traffic receipts owing to the great increase in motor omnibus competition had the effect of bringing to a negligible figure the surplus for 1912-13 to be added to the renewals fund, and the surplus for the current year would be very small unless conditions were materially altered. The question of the rate per car-mile required became therefore for the moment an academic one. At the same time it was desirable to review the position. Taking the capital cost of the items for which renewals provision should be made, and providing (by cumulative annuity) for the renewal, the annual provision would be as cited below.

| | Annual provision for the renewal. | Amount per car-mile.* |
|---|---|---|
| | £ | d. |
| Permanent way—surface work only, excluding slot rails, but including electrical equipment ... ... ... ... | 116,304 | ·498 |
| Generating station machinery and plant .. ... ... ... | 13,235 | ·057 |
| Sub-station machinery and plant... ... ... ... ... | 6,566 | ·028 |
| Cables and feeder pillars..... ... ... ... ... ... | 9,497 | ·041 |
| Machinery and plant in central car repair depot and other depots ... ... ... ... ... ... ... ... ... | 1,319 | ·006 |
| Motor cars, lorries, wagons, carts, etc. ... ... ... ... | 1,182 | ·005 |
| Total ... ... ... ... ... ... ... ... | £148,103 | ·635 |

* Based on 56,000,000 miles.

It was very difficult to estimate the amount required for renewals beyond the next five years, but it was considered that an average expenditure of about £139,000 a year, equal to ·595d. per car-mile, would be sufficient. On March 31 last the renewals fund amounted to £633,010, while in addition there was the general reserve fund amounting to £273,786. In view of the impracticability under existing conditions of estimating the amount that would be available for renewals there appeared to be no practical advantage in revising the basis at present, and the committee were of opinion that there should be carried to the renewals fund the actual surplus each year, leaving the question of a possible revision of the basis for a further period of two years. In regard to the reserve fund, nothing was available to be carried to it for the year 1912-13, and it was not estimated that there would be any sum available for the year 1913-14. It therefore did not appear necessary that any decision as to the constitution of this fund should be come to at present. The Finance Committee agreed with the Highways Committee, and said that they had adjourned the matter of the reserve fund for two years.

## PATENT LIST.

**Specially abstracted for "The Tramway and Railway World" from the Official Journal of Patents.**

*** If the inventions have been communicated the names of the communicators are given below in italics.

APPLICATIONS.

Applications for Letters Patent have been filed:

14,440 Pull-down inverted seat for omnibuses, etc.—A. J. Heron.
14,446 Apparatus for cutting or lowering the check rail or other surfaces on tramways or railways R. Stirk.
14,459 Operating mechanism of sand-discharge valves for electrically propelled vehicles—J. F. Simpson.
14,462 Control mechanism of power-propelled vehicles—Daimler Company, Limited, and E. C. Horsley.
14,467 Life guard for motor omnibuses—G. T. Corrie.
14,501 Automatic life-guard S. Simmins.
14,519 Rail joints—J. Wattmann and Tudor Accumulator Co., Ltd.
14,542 Motor traction P. W. Brown.
14,650 Front life-guards for motor omnibuses—W. Freakley.
14,762 Life-guards for motor omnibuses S. E. Williams.
14,771 Electric signals for railways—A. R. Mutton.
14,796 Electric motor control systems—British Thomson-Houston Company, Limited (*General Electric Company*).
14,831 Construction of wheels of motor vehicles—C. S. Challiner and J. A. Challiner.
14,876 Guards for motor vehicles A. F. Davis.
14,898 Vacuum brakes for railway vehicles—G. Paget.
14,906 Signalling apparatus for railways—J. W. Brunskill.

14,981 Life-guard for motor omnibuses—F. Gore.
15,013 Life-guard for the front of motor omnibuses—L. le Bosse.
15,077 Folding or extensible car step—H. D. Kirkley.
15,121 Collection of fares on omnibuses, tramways, and railway cars—E. Peckham.
15,125 Front-guards for motor omnibuses—W. Courtness.
15,149 Change-over arrangements for electric supply or control systems—Siemens Brothers Dynamo Works, Limited, F. Lydall, and C. E. Fairburn.
15,178 Means for preventing railroad rails from creeping—M. L. Phelps.
15,205 Fluid-pressure braking apparatus—W. V. Turner.
15,208 Mechanical revolving guard for motor omnibuses—W. Wye.
15,245 Guards for motor omnibuses—P. C. Sarapata.
15,381 Track construction—J. Noll.
15,407 Expanding joint for rails—J. Thornycroft.
15,453 Guard for motor omnibuses—W. Knott.
15,498 Power-operated brakes—E. V. Hartford.
15,516 Means of using auxiliary petrol-electric supply for electric rail cars, trackless trolley vehicles, etc.—W. A. Stevens.
15,658 Electric railways—C. M. White (*M. E. Sturges*).
15,701 Car fenders—J. A. MacMahon and J. T. Warden.
15,744 Guard for motor omnibuses—A. E. Beecher-Brigden.
15,286 Guard for motor omnibuses, etc—E. W. Evans.
15,886 Life-saving device for motor vehicles, trams, etc.—E. A. Higham and F. Flint.
15,907 Life-guard—J. R. J. Amor.
16,076 Top-deck seating arrangements for motor omnibuses—W. J. Hickman.
16,112 Guard for motor omnibuses—A. E. Gibbs.
16,177 Safety appliances for motor omnibuses—V. G. Burtonshaw.
16,193 Apparatus for controlling traffic on single-line railways—W. E. Tyer and Tyer and Company.
16,196 Front guards for motor cars, omnibuses, etc.—F. Tye.
16,281 Trucks for tramcars—M. E. Curwen (*J. G. Brill Company*).
16,294 Rail joint—E. H. C. Rayn.
16,343 Guards for vehicles—J. H. Davies.
16,347 Life-guards for motor omnibuses—A. G. Evans
16,588 Power transmission and propulsion for self-propelled vehicles—D. Marshall.
16,597 Mechanism for indicating the positions of trains, trams, and road vehicles—B. Davies.
16,602 Wheel-guard or obstruction remover for motor and tramway vehicles—W. J. Gooding and D. A. Sweeney.
16,705 Trolley heads for overhead electric traction—E. H. Underwood.
16,817 Passenger cars—P. N. Jones.
16,837 Rail joints—C. S. Broomhall.
16,861 Automatic brake mechanism for railway trains—J. Jacoubof.
16,897 Life-guards for motor omnibuses—G. A. Spencer.
17,005 Axle boxes for tramway and railroad vehicles—C. Delmez.
17,051 Guards for motor omnibuses—E. E. Haynes.
17,087 Trucks for railway and tramway vehicles—J. A. Brooks.
17,088 Brake mechanism for railways and tramways—J. A. Brooks.
17,093 Collapsible covers or roofs for motor omnibuses, tramcars, etc.—G. M. Giles.
17,103 Automatic reversible seat for motor omnibuses—C. Katz.
17,129 Track system for railways—M. G. Fernandez.

## Specifications Published.

1912.

13,208 Electrical signalling apparatus—Chapman (*Chapman*).
13,426 Tickets—International P-A-Y-E Tramcar Co. and Tanner.
22,034 Railway and road passenger vehicles—Rowntree.
5,703 Electrically-controlled point mechanism for railways—Collins.
14,119 Supports for route indicator boards—Goodwin and London General Omnibus Company.
21,927 Tramway tracks—Starke.
14,029 Apparatus for applying tyres to the wheels of tramway vehicles—Cowley and Taylor.
14,584 Railway and road passenger vehicles—International P-A-Y-E Tramcar Company and Tanner.
17,116 Tramway points—Crosta and Hill.
9,637 Apparatus for actuating conduit covers and collector ploughs of electric railways—Samaia.
29,828 Railway chairs and chair keys—Imray (*Stephenson*).

1913.

218 Alumino-thermic and similar methods of uniting railway and tramway rails—Th. Goldschmidt Akt.-Ges.
413 Chairs for railway rails—Dumartin.
2,886 Securing railway rails to sleepers—Stephenson and Stephenson.
8,147 Car replacers—Calhoun.
142 Railway points and switches—Steedman.
4,340 Devices for preventing railroad rails from moving lengthwise—Vaughan.
7,117 Car couplings—Pendexter.

**Messrs. Thermit, Limited,** have removed into larger and more convenient works at 675, Commercial Road, London, E., to which all goods should in future be sent. All communications should be addressed to 72, Martin's Lane, Cannon Street, E.C., as before.

Judged from any point of view the Olympia exhibition of commercial and public passenger vehicles established a record in the annals of the industry. In the following pages we deal fully with the exhibition, its aims, and its results, and here we need only say that its success atoned for the interval of five years since the holding of the last show in London, and was a striking demonstration of the progress that this branch of automobile manufacture has made in the interval. The exhibition derived additional importance from the happy suggestion of Mr. Horace Wyatt, the editor of *Motor Traction*, which led to the holding concurrently of an Imperial Motor Transport Conference. This latter event was so widely and influentially taken up that it will rank as the premier Empire gathering yet held. Although it was organised at short notice the manufacturers responded extremely well to the opportunity it gave them to show what they are prepared to do in the provision of vehicles suited to Colonial wants. So successful did the conference prove that no surprise will be created if similar assemblies are organised at intervals of two or three years. Not the least encouraging feature of the exhibition was the manner in which British makers have retained the lead in commercial and public passenger vehicles. The stands devoted to the display of vehicles totalled 73, and of the 67 different makes exhibited not more than 19 were foreign. A feature of the exhibition was the continued rivalry between the shaft drive and the chain drive. The latter has made notable advance, an improvement here comprising a reducing worm placed between the clutch and the gear box. On live axle vehicles double-reduction gearing is being enclosed in the axle casings.

---

Elsewhere in this issue will be found extracts from such of the papers submitted to the conference as have especial interest for commercial and passenger motor users, and also to manufacturers who desire to know something more of the requirements of the Colonial trade. In view of the high price of fuel, particular interest is attached to the papers on substitutes for petrol. The maintenance of a sufficient supply of fuel which does not run the risk of being cut off in time of war is vital to the existence of the nation, especially as a considerable portion of the Navy is now composed of vessels propelled by oil engines, while the numbers of this class of craft are to be greatly increased because of their greater effectiveness in keeping at sea without refueling. This circumstance alone should lead the Government at once to fall in with the resolution passed by the conference, which depends for its successful issue upon a relaxation of the excise regulations in reference to the manufacture of alcohol. A vast quantity of this can be produced from potatoes and other products in this country, thus giving a sadly required impetus to agriculture.

---

It was upon the advice of Sir Boverton Redwood and Prof. V. B. Lewis that the conference decided upon alcohol as the most promising source of supply, and an encouraging fact is that these gentlemen are experts who were called upon to advise the authorities in the matter of the regulations for the storage and transport of petroleum products. Apart from providing alcoholic fuel another problem has to be solved, namely the construction of a motor suited to the use of that fuel. In this respect the United States and Germany have already made some progress. The conference resolved to appoint a committee to further the idea and to suggest ways and means. As this is a matter now under the consideration of the committee of all motor interests which met last year under the auspices of the Royal Automobile Club, a joint consultation will be advisable, especially as the Society of Motor Manufacturers and Traders have voted £2,000 as a prize for discovery of a home-made fuel in commercial quantities. It is interesting to observe that the decision in favour of alcohol was also arrived at by the far-seeing Fuels Committee of the old Motor Union in 1907, after investigation by a committee which sat for several months and collected much evidence from expert witnesses.

---

All who are concerned in public passenger road traffic will be interested in the result of what appears to be the first appeal made from the King's Bench Division by a motor omnibus undertaking in regard to the use of a railway bridge. The case is the more important because of the fact that there are many railway bridges of medium strength, such as that at Cranley Gardens, which has been the cause of litigation between the Great Northern Railway Company and the London General Omnibus Company. It is situated over a short railway that runs to the Alexandra Palace from Highgate Station. The route is apparently a good one from the omnibus company's point of view, and although the company ultimately solved the difficulty by finding an alternative road, the use of the bridge by omnibuses had the effect of inducing

Digitized by Google

# MOTOR TRAFFIC.

the railway company to strengthen the structure. In securing this result a public service was rendered, for it is not often that the organisations devoted to the protection of heavy motor vehicle and traction engine interests are able to bring about a similarly fortunate ending to their disputes with the railway companies. At the police court proceedings which were taken when the omnibus company refused to desist from using the bridge, the contention was put forward on their behalf that the regulation under which the railway company purported to act was contrary to the provisions of the Locomotives and Highways Act, 1896, and therefore was not valid and binding. Under that Act, it was urged, the control of heavy motor traffic in connection with road bridges rested entirely with the Local Government Board and with the county and county borough councils, and that the Board had no power to delegate the control to railway companies or other bodies responsible for the repair of those bridges or structures. These contentions failed to impress the magistrates, and the case went against the omnibus proprietors. When the latter took the matter to the King's Bench Division on appeal, the Divisional Court supported the magistrates' decision, and found that the regulation objected to in the Heavy Motor Car Orders was valid and binding in virtue of the powers of the Local Government Board to make regulations under section 6 of the Act of 1896 and section 12 of the Motor Car Act, 1903.

## THE MOTOR VEHICLE EXHIBITION AT OLYMPIA.

The exhibition of industrial motor vehicles organised by the Society of Motor Manufacturers and Traders was held at Olympia from July 18 to 26 and, although few novelties were to be found there, the exhibits were generally of the highest class and showed a very distinct improvement, both in design and workmanship, upon those of any previous industrial vehicle exhibition. It was not to be expected that an exhibition confined entirely to trade and public service vehicles would attract the general public, and at no time could the attendance be compared with that of the annual motor show organised by the Society in November. The number of visitors was, however, well up to the standard of industrial shows, and, moreover, these were of the class most desired by the exhibitors. The fact that the Imperial Motor Transport Conference had been arranged in conjunction with the exhibition contributed largely to the success of the latter, and assured the attendance of a large number of influential personages from all parts of the world; indeed, one of the most satisfactory features of the conference and the exhibition was the keen interest of the oversea delegates, who were drawn from practically every part of the British Empire. The distinguished visitors, who were the guests of the Society of Motor Manufacturers and Traders, included the leaders of the motor movement

General View of Motor Vehicle Exhibition at Olympia, Looking Towards the Entrance.

## MOTOR TRAFFIC.

in this country as well as the oversea delegates to the conference, so that the gathering at Olympia on the morning of Friday, July 18, was unique in the history of the industrial motor industry.

When one recalls the years of patient endeavour which have been devoted to the production of reliable motor vehicles, it must have been gratifying to the manufacturers who were the pioneers of the industry to find not only that their efforts have been crowned with success, as shown by the rapidly-increasing demand for their output, but that their society had received Royal recognition inasmuch as a distinguished member of the Royal House attended the opening of their exhibition for the purpose of receiving the society's inspection of the public service models shown on the principal stands. The large number of Colonial visitors were amply repaid for the trouble they had taken in connection with the show, for a number of manufacturers had made a feature of Colonial models which in themselves gave evidence of careful study of the actual requirements of motor traffic in countries where well-made roads and up-to-date supply depots are the exception rather than the rule. The 75-H.P. Colonial wagon shown by Halley's Industrial Motors, Limited, is a striking demonstration of this fact.

A number of new models for the home market were shown, notable examples being those exhibited by Thos. Tilling, Limited. This old established-firm of

Motor Vehicle Exhibition at Olympia—View from the Entrance.

guests. His Royal Highness Prince Arthur of Connaught, as president of the Imperial Motor Transport Conference, after spending considerable time in examining the various exhibits, formally declared the exhibition open, and welcomed the delegates to the conference, all of whom were presented to His Highness.

A feature of special importance to the motor manufacturers was the keen interest taken in the exhibition by various municipal authorities both at home and abroad. A large number of the members of city, borough, urban, and other local authorities attended, many of them being accompanied by their chief officials; and we understand that a considerable amount of business is expected to follow their careful hiring contractors have taken advantage of the exceptional experience they have gained in the running of their large fleet of industrial motor vehicles and mail services, and they have evolved two new models which were generally accepted as being as fine specimens in design and workmanship as any exhibited at the show.

Proof of the growing popularity of motor vehicles in the cleansing departments of municipal undertakings was given in the number of exhibits which had been specially designed for the various duties pertaining to this department. These included combined watering and sweeping machines, tipping wagons for refuse and dust collection, and also for transporting road-making material, tank wagons, etc. Development was also very noticeable in fire-fighting appliances. Great progress

Digitized by Google

# MOTOR TRAFFIC.

has been made in this section of "public service" both in the range and the efficiency of the machines shown. It is now possible for the smallest town or district to furnish its brigade with an up-to-date motor fire engine fully equipped with all the latest appliances and of a capacity suitable to its requirements, while, on the other hand, the largest and most powerful fire engine yet constructed, with a normal capacity of 850 gallons per minute, was also to be seen.

In distinct contrast to previous industrial motor exhibitions, the motor omnibus did not figure prominently, only three vehicles of the double-deck type being exhibited. Each of these, however, had features of special interest, and attracted considerable attention from the large number of tramway men who visited the show. Chars-a-bancs, or public service touring cars, as many prefer to call them, were again a feature, many very handsome vehicles of varying capacity being exhibited. The petrol-electric system of motor traction was represented by W. A. Stevens, Limited, with a number of vehicles fitted with the Tilling-Stevens combination, the efficiency and reliability of which is now so well known. During his tour of inspection, H.R.H. Prince Arthur of Connaught showed a keen interest in the petrol-electric system, and requested Mr. Stevens to arrange for him to see a touring car fitted on the Tilling-Stevens system.

The outstanding change to be noticed throughout the whole exhibition was undoubtedly the great improvements directly traceable to the introduction of high tensile steel for the manufacture of all vital parts, and the special machines and plant for the treatment of these steels on scientific lines. The use of higher grade material has enabled the manufacturers to produce much more reliable vehicles, and at the same time considerably to reduce the weight of all types. The improvements, although perhaps not very apparent to the average visitor until his attention has been called to them, have, speaking generally, had a marked effect upon the value of the latest models now available. Amongst the advantages most noticeable are, fuel economy, due to improved design and more efficient carburettors, silent running, flexibility, and accessibility. The engines of to-day are lighter, the cooling system is more perfect, while lubrication has been brought to a very high state of efficiency. Moreover, the mounting of the various parts has received considerable attention: in a number of instances we noticed flexible connections which must have a most beneficial effect upon the life of the vehicle. The large extent to which ball bearings now enter into the construction of the chassis has eliminated friction to a remarkable degree. Various methods of transmission were to be seen on the various stands, but by far the greater number of vehicles were fitted with the worm drive. In all the large axle-driven machines, the whole of the weight of the vehicle and its load is now taken by the dead axle, the driving shafts being designed for the one purpose of propelling the machine. Gear boxes also show the result of attention from the experienced designer having high-class material at his disposal; reduction in size, ease of gear change, and the introduction of ball and roller bearings are the chief features of the improved type. The chain type of gear box was also in evidence, and has now clearly demonstrated its practicability.

A feature of special importance in public service vehicles—viz., the braking power—has also received attention. Not only is the braking area increased on a number of models, but in some cases a third brake is provided, while the importance of easy adjustment has also been recognised.

Mr. Sidney Straker.

A noticeable feature of the tyre and accessory section of the exhibition was the large number of rubber manufacturers and factors who are now devoting their attention to solid rubber tyres. Some remarkable results have been obtained by several of the older firms, mileages of 30,000 and even 40,000 being by no means uncommon. In view of the fact that tyre cost has been a retarding factor in a number of cases where motor traction has been considered desirable, both on the part of municipal and private undertakings, this demonstration of the reliability of the output of the leading firms should do much to encourage the development of public motor services, and should also point to the advisability of purchase outright rather than hire on mileage contracts, as the advantage of the extra life beyond the 10,000 miles guarantee would be with the purchaser.

Taken altogether, the exhibition of 1913 has been fully justified, and as a direct result of the practical demonstration which it afforded of the great advance in the industrial motor industry that has been made during the past five years, we shall look for a large increase of users both at home and in the Colonies.

The members of the Commercial Vehicle Committee of the Society of Motor Manufacturers and Traders, who were directly responsible for the organisation of the exhibition, are to be congratulated upon the satisfactory result of their labours. The names of these gentlemen are as follow: Sidney Straker (chairman), J. H. Adams, F. Churchill, R. F. Clayton, R. Barry Cole, C. Davis, W. Dewis, H. E. Fulton, F. Garrett, G. Hoare, P. Liversidge, J. Maughling, A. E. Meadon, A. Norriss, R. J. Paton, F. W. Robson, F. Searle, A. Spurrier, and R. E. Wilson.

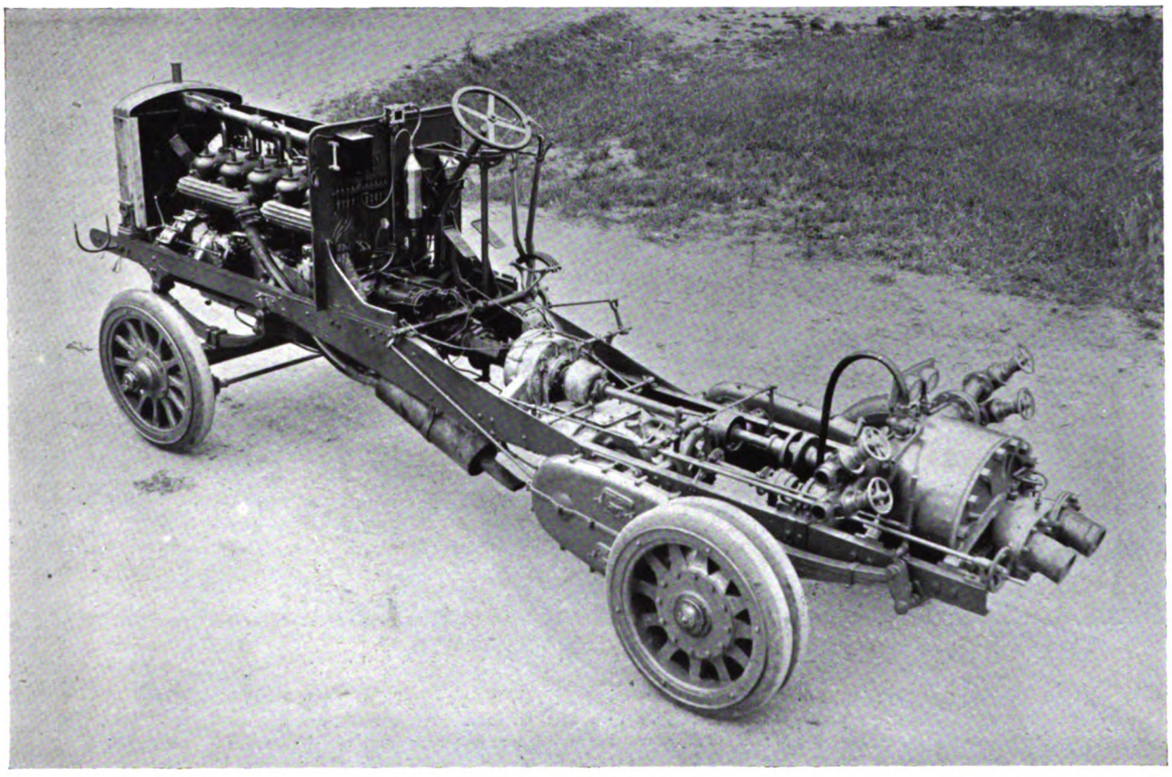
# MOTOR TRAFFIC.

## THE EXHIBITS.

**Commercial Cars, Limited.**—The most prominent exhibit on this stand was a large fire engine, the largest, we believe, yet constructed. The illustration shows the chassis stripped of the temporary body with which it was equipped for show purposes, and from this a good idea of its general proportions will be gathered. The machine, which is a repeat order from abroad, is one of a number under construction. It is to be fitted with an American type all-steel body. It has a 6-cylinder engine, developing 100 H.P. at normal speed, the cylinders being 160 mm. by 190 mm. The pump, fitted by Simonis, of Walthamstow, has a capacity of 850 gallons per minute, with two 6-inch suctions, and four 3-inch outlets. These cars have half-compression, and are also fitted with self starters. The direct drive is to the pump, the transmission to the road wheels being through the patent gear box, which is a special feature on all this company's models. The engine is fitted with two Claudel-Hobson carburettors, and is capable of driving the machine at speeds up to 50 miles per hour when fully loaded. There are several special features in the construction of this chassis. Provision is made for an extra supply of water from the pump when the machine is in operation, thus ensuring a perfect supply of cooling water under all conditions. Water is also taken for cooling the oil circulation. Amongst the other exhibits, of which there were six, the 28-seater chars-a-banc attracted the most attention; indeed we understand that definite orders were placed during the show for no fewer than five machines similar to the one exhibited. This machine was fitted with a 36-H.P. 4-cylinder engine and had a flush-sided torpedo type body. The 6-ton tipping wagon illustrated in a previous issue found considerable favour with municipal visitors, the simplicity of the tipping mechanism being much appreciated. The particular machine shown is being shipped to Canada, but a considerable number are in use in this country and giving complete satisfaction. A model of a motor horse-box was also shown on this stand and attracted considerable attention. In construction this is similar to the well-known railway type, and affords accommodation for two horses. Entrance for the horses can be effected either from the side or rear end of the vehicle, a hand winding drum being fitted for operating the flaps. There is also an entrance from the driver's seat to the horses. The whole scheme appears to have been well thought out, and the vehicles already supplied by Messrs. Commercial Cars are being used with great success.

**Coventry Chain Company, Limited,** had an exceptionally interesting exhibit of their various patterns of chains together with a number of models, which clearly demonstrated the wide field now covered by this method of power transmission. Amongst these were models illustrating the drive to cam shafts and magneto driving, as well as a heavy vehicle drive capable of transmitting 46 H.P. at 500 revolutions per minute of the driving pinion. Three chain-driven change-speed gear boxes of a new type were also shown, and as this type of gear box is now the standard of both the London General Omnibus Company and the Daimler Company for all their omnibuses, it follows that this exhibit attracted considerable attention throughout the run of the exhibition.

**Brampton Brothers, Limited,** had a tastefully arranged exhibit of sprockets and pinions. There was also a collection of roller chains in various pitches and widths, applicable to all types of commercial vehicles, and silent chains in various types, pitches, and widths, suitable for cam shaft and magneto drives, gear boxes, and drives to road wheels.



100-h.p. Fire Engine by Commercial Cars, Limited.

**The Avon India Rubber Company, Limited,** had a comprehensive display of the various tyres for which they are famous. In addition to the well-known sections they also showed a number of new sections and sizes which they are introducing as the B tyre, from which excellent results are expected. An interesting feature was the display of tyres taken from service for exhibition purposes after having run well over their guarantee. One set, taken from an Albion van after running 22,400 miles, was by no means worn out, and we understand it will be returned for further service. A feature of interest on this stand was the Coleman patent triple non-skid tyre. This is made up with two hard and one soft rubber sections, the soft one being in the middle and made to stand up about half an inch above the level of the two outer rings. A tyre which had run some thousands of miles on a National Steam Company's omnibus was also shown.

**J. W. and T. Connolly, Limited,** in addition to a large range of solid tyres, also displayed a number of wheels made on the "airless" principle.

**Gaulois Tyres (1909) Limited.**—This firm attracted considerable attention by displaying on their stand a number of Bergougnan solid tyres, together with the announcement that out of a total entry of 98 vehicles for the French military trials, 76 were fitted with these tyres.

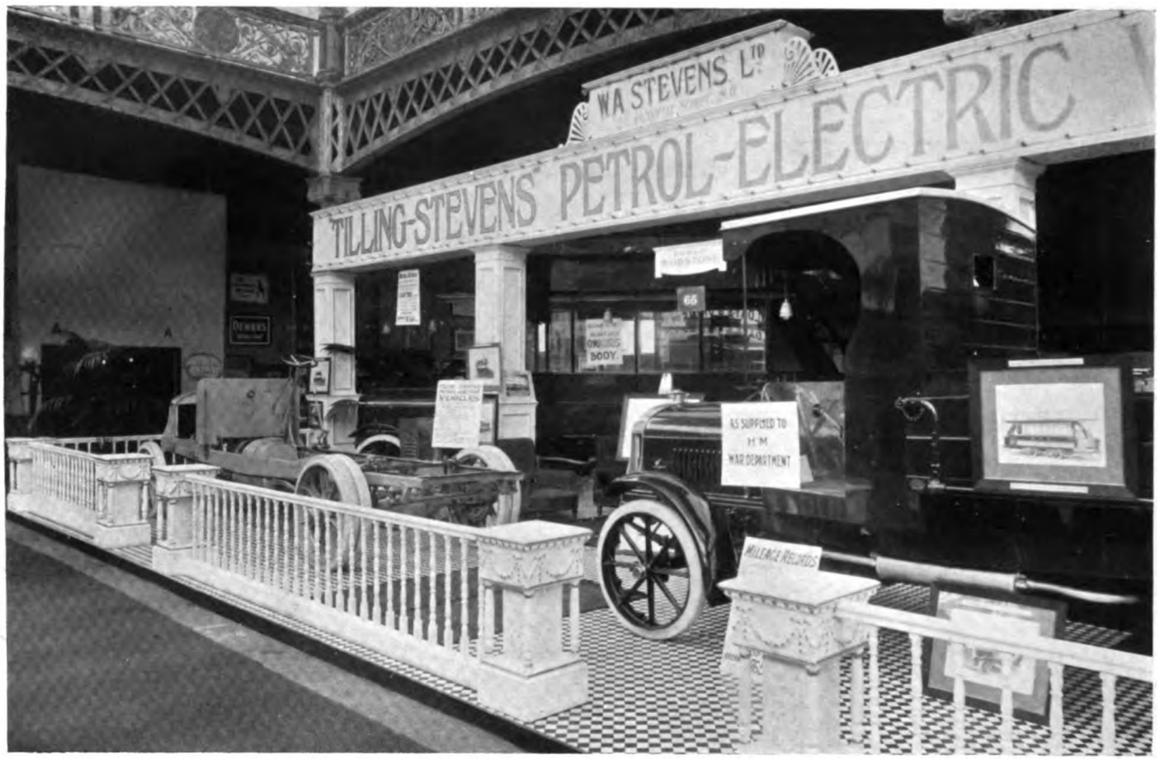
Digitized by Google

# MOTOR TRAFFIC.

**W. A. Stevens, Limited,** showed four examples of the Tilling-Stevens petrol-electric system. Whether by reason of the comparative novelty of the combination, or by reason of the excellent results obtained by Thomas Tilling, Limited, in the running of their large fleet of London 'buses, all of which are now fitted on this system, there can be no two opinions as to the keen interest in this exhibit shown by the majority of the visitors. Throughout the entire run of the exhibition the staff of salesmen had difficulty in interviewing all those who were interested, and we understand that the number of inquiries received from potential users was very large, and included both municipal and private interests. Each of the examples shown was of the 40-H.P. model, which is doing such good work in Birmingham, Liverpool, Newcastle, etc. The exhibits included a bare chassis, a double-deck omnibus, a torpedo public touring car, and a 4-ton lorry.

**White and Poppe, Limited.**—This firm's reputation has been built up in specialising for the most important of all the parts of the motor vehicle—the internal combustion engine. No better testimony to the merits of the White and Poppe engines can be desired than to know that they are also advantageously used for re-engining a car. In addition to an exquisitely-made range of petrol engines, the stand contained engines equipped for the use of paraffin and an extensive selection of carburettors suitable for all types of commercial vehicle engines.

**Argylls, Limited,** had an extensive and representative exhibit of the well-known models produced at their factory north of the Clyde. These included a 15-H.P. taxi cab, a 15-cwt. delivery van on a similar chassis, a 1-ton delivery van, and a 2-ton chassis fitted with a 20-H.P. engine.



**General View of the Stand of W. A. Stevens, Limited.**

The double-deck omnibus, which is particularly suited for provincial work, is capable of accommodating 40 passengers in addition to the driver, and is similar to that designed by Mr. Ellison, general manager of the Eastbourne Corporation motor department. Special attention has been paid to the comfort of the passengers, both in regard to the arrangement and furnishing of the seats, and the space between them. The body was built by J. Liversidge and Son, and is an excellent example of the coach builder's art. The bare chassis afforded an opportunity for the close inspection of the petrol-electric combination, which has already been fully described in these pages. Briefly, the system as shown consists of a 40-H.P. petrol engine placed in the usual position under a bonnet with a direct drive to a shunt-wound generator: this is carried, together with the motor, upon a special frame built into the main chassis frame. The series-wound motor is permanently connected to the generator and drives a universally jointed propeller shaft, the final drive being by means of a live axle fitted with an over-drive worm gear. The speed of the vehicle is regulated by means of resistances operated by a lever placed on the steering column, a reversing switch being also provided. The system is one that has now been thoroughly well tried, and has proved itself to be both reliable and efficient. An item that attracted considerable attention was the display of two large charts. These showed the transmission strains as they were recorded by the accelerometer on a gear-driven omnibus and a Tilling-Stevens omnibus under identical conditions, and are of special interest, as they clearly illustrate the regularity of the acceleration made possible by the electric drive.

**E. G. Wrigley and Company, Limited,** had some very fine examples of their high-class gear and worm wheels displayed on their stand. An exhibit which attracted considerable attention was a complete rear axle for a 2-ton chassis. This was worm-driven, and fitted with a single-brake drum on each wheel, on which act external contracting and internal expanding brake shoes. The gear and countershaft for a chain-driven vehicle were also shown, and a spring-driven self-starter, which is quite a new idea, found many friends.

**Stern-Sonneborn Oil Company, Limited.**—A complete range of the "Sternol" lubricants was shown. A considerable amount of attention was attracted by running a gear box filled with a special gear lubricant known as "Ambroleum." This clearly demonstrated the fact that the lubricant clings to the teeth of the gears, and renders the gear box perfectly silent, besides perfectly lubricating the pinions.

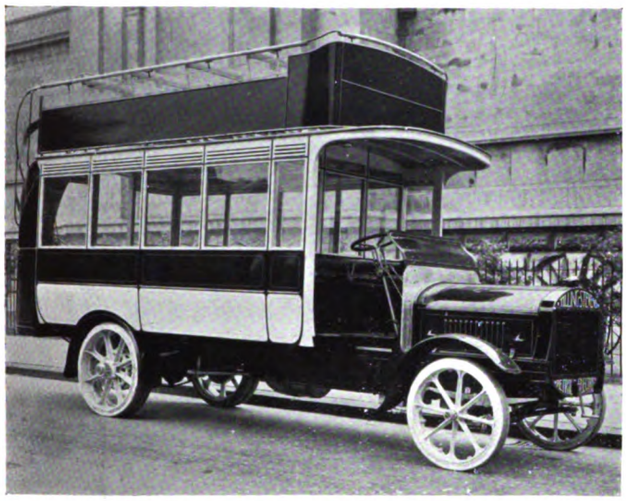
**Liga Tyres, Limited,** had a display of continuous-band tyres of various sizes and suitable for all commercial purposes. A section of a standard tyre was also exhibited for the purpose of showing the construction and method of building up the tyre. A ball of pure Para rubber and sheets of plantation rubber, some smoked and some in its natural state, added considerably to the interest of the exhibit.

**R. W. Coan,** of Goswell Road, the aluminum casting specialist, had some exceptionally fine castings on show at his stand. This included cleverly designed gear boxes, crank cases, and other parts of the modern chassis which have done much to reduce weight and improve appearance. A 6-cylinder crank case displayed at the back of the stand was an exceptionally fine piece of work.

Digitized by Google

# MOTOR TRAFFIC.

**S. Wolf and Company, Limited,** of "Solex" fame, had a stand full of interesting things, including electrically-driven drills, magnetos, sparking plugs, pumps, horns, tyre levers, etc. By far the most important part of their exhibit was the "Solex" specialities, the carburettor and radiator, both of which have been described in these pages. The success of the radiator as now applied to the Tilling-Stevens omnibuses in London has been most marked, and we understand that it is the intention of Thomas Tilling to adopt this as the standard for their omnibus fleet.



Tilling-Stevens Petrol-Electric Omnibus.

Interior of Tilling-Stevens Omnibus.

**Alldays and Onions, Limited,** staged no fewer than seven different models, the two extremes being a 5-ton chassis fitted with a 30-40-H.P. engine and a 5-cwt. delivery van fitted with an 8-H.P. engine.

**Sidney Straker and Squire, Limited.**—This well-arranged exhibit included six machines, four finished vehicles and two bare chassis. The complete vehicles included a 21-H.P. private station omnibus, a light box van on a similar chassis, a 3-ton box van, and a 3-ton sheet van with detachable sides, each on chassis fitted with 28-40-H.P. engines and a large pantechnicon van on a specially constructed chassis also fitted with the 28-40-H.P. engine. The two bare chassis shown were the two models fitted to the complete vehicles, viz.; the 21-H.P. 30-cwt. type, and the 28-40 type with a carrying capacity up to four tons. In the larger model the cylinders are cast in pairs, 4½ in. bore and 5 in. stroke, while in the smaller machine they are cast *en bloc*, 90 mm. by 120 mm. Both of these chassis have worm-driven live axles, and the general construction is on similar lines, the cardan shafts being fitted with double universal joints. In the larger model a four-speed chain-driven gear box is fitted, but the smaller machine has an ordinary three-speed box. The load bearing axles in both cases are of the solid forging type with the worm gearing and differential carried in a strong sheet casing on the top. In the larger machine the braking arrangement is somewhat different, as in addition to the brake arranged to act upon the back wheels, the foot brake takes effect through contracting shoes on a metal brake drum fitted just behind the gear box. Throughout the whole run of the show the time and attention of the sales staff on this stand was fully occupied, and Messrs. Straker and Squire must be well pleased with the interest created by their latest models. We understand that in addition to the very large number of inquiries received and the refusal of orders on account of price or unreasonable delivery, no less than 13 actual orders were booked at the exhibition.

3-Ton Straker Van.

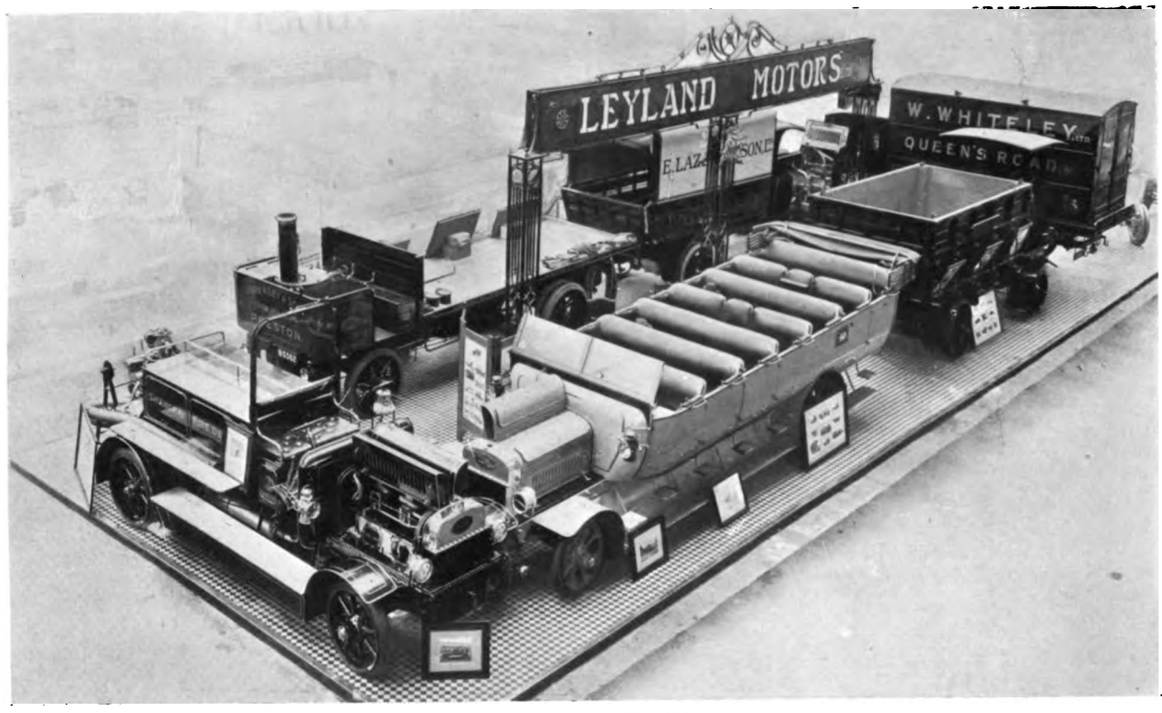
**Pedrail Transport, Limited,** had an exhibit which attracted much attention. In their latest adaptation of the "Pedrail" system, the machine has undergone a complete transformation since it was last before the public some years ago. Instead of the hinged feet fitted to a wheel, the feet are now carried on an endless chain working over two axles placed a sufficient distance apart so that two or three feet are always on the ground at the same time. The feet approach the ground with their faces in a horizontal position, and it is claimed as an advantage of the system that there is no slip or suction effect upon the road. The machine exhibited is intended to be worked with a trailer, and the steering is carried out by using the trailer in the form of a rudder, this being operated with worm gearing controlled by a hand wheel from the driver's seat. The two vehicles are connected together by means of a vertical pin joint situated midway between them. The strong point advanced in favour of the pedrail is the fact that with a 10-ton vehicle the average weight on the ground when fully loaded is only 14 lb. per square in., so that with this system mechanical transport is made possible over soft ground which otherwise would be impossible.

**The Wolseley Tool and Motor Car Company, Limited,** included in their exhibit five specimens of the new models now being constructed at their works. These ranged from a light delivery van, with a carrying capacity of 12 cwts. and fittted with a 12-16-H.P. engine to a 3½-ton chassis fitted with a 35-H.P. engine, designed to meet the requirements of the War Office subsidy scheme for class 4 vehicles. The engine is of the 4-cylinder type, with automatic lubrication and water circulation by pump. The bevel-driven back axle is of the double-reduction type, while the gear box gives four speeds forward and a reverse.

Digitized by Google

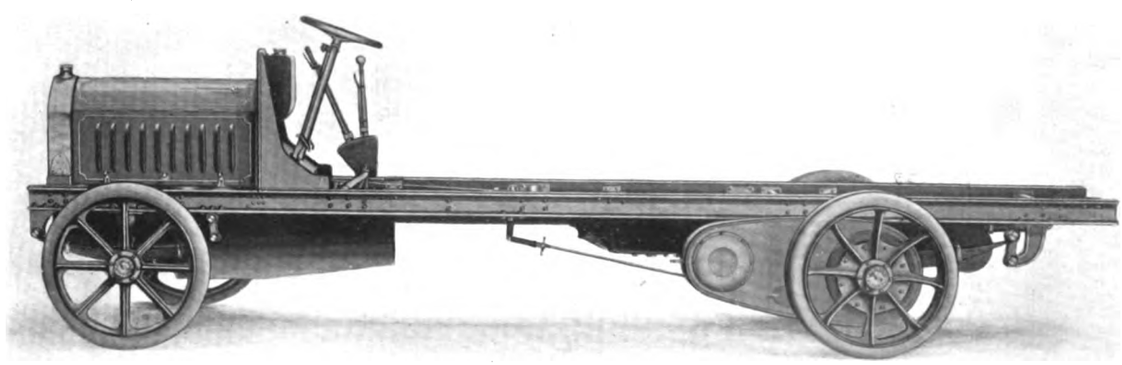
# MOTOR TRAFFIC.

**Leyland Motors, Limited.**—One of the most notable displays was to be seen here with five petrol and one steam vehicle. Prominent among the former was a 3-ton lorry chassis, fitted with a sling furniture removal body, to the order of Whiteleys. It had gained the War Office subsidy of £110, had a 30-H.P. engine, and a gear-driven live axle. Other petrol exhibits comprised a 40-H.P. 4-ton van, with standard gear-driven live axle, and 4-speed gear box. A torpedo char-a-banc, fitted with Cape hood and wind screen, had a 40-H.P. engine. The latter exhibit was universally admired; its price was £1,018. It seats 32 passengers. Bombay Corporation had purchased the 4-ton municipal tip wagon, of 40-H.P., fitted with refuse body, interchangeable with a tank body, suitable for holding 1,000 gallons of water for street watering. Another splendid exhibit was the 55 H.P. fire engine, fitted with a Rees-Roturbo 4-stage turbine pump, delivering 450 gallons per minute. This was listed at £1,050. The steam exhibit was a 35-H.P. 6-ton wagon with lorry platform, capable of pulling a trailer loaded with four tons. The boiler gives 250 lb. steam pressure with superheated coil. At £560 this was the cheapest vehicle on the stand. Upon the restricted limits at Olympia it was not possible to give an adequate idea of the wide range of uses to which the Leyland products are put. The company cater for every industry and trade, and they also have a world-wide reputation as makers of petrol railway and tramway cars. Their public passenger vehicles range from the smooth-running double deck 'buses of the Central Company in London and those of the London and North Western Railway Company, to single-deck vehicles employed by companies in all parts of the kingdom, and also abroad. To appreciate fully the scope of the Leyland Company's activities, a copy of their latest catalogue should be applied for. This is one of the finest catalogues yet published in connection with the motor industry.



**The Leyland Exhibit.**

**Albion Motor Car Company, Limited.**—This exhibit included two bare chassis and four complete vehicles These were a 32-H.P. 3-ton chassis, a 25-H.P. 2-ton chassis, a 32-H.P. 4-ton lorry, a 32-H.P. 29-seater torpedo char-a-banc, a 25-cwt. box van, and a 15-cwt. box van. Of the two chassis the 25-H.P. machine, which is an addition to the Albion models, attracted by far the greater attention. As will be seen by the accompanying illustration, this machine does not conform to the War Office subsidy specification, inasmuch as it is chain driven, although we understand that at one time it was intended to design this model for that purpose. The engine is of the 4-cylinder type, cast in pairs,



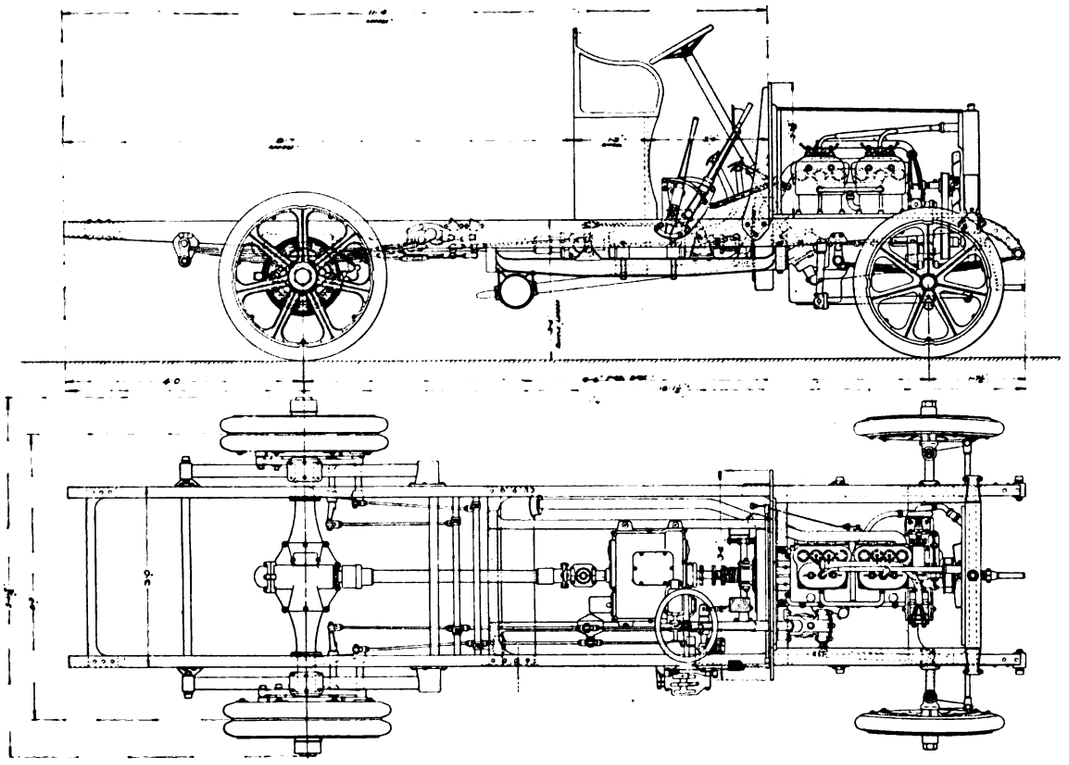
**2-Ton Albion Chassis.**

Digitized by Google

# MOTOR TRAFFIC.

102 mm. by 140 mm., giving 25 H.P. at normal speed. The Albion patent combined pump and fan insures an efficient cooling system in conjunction with a radiator of the flattened tube type. The valves are all arranged on one side, and are mechanically operated. A small gear-driven pump supplies oil under pressure to each of the main bearings, the valve gear being lubricated by the splash. The engine is governed on the inlet by the Murray patent governor fitted to the front end of the crank shaft; this effectually prevents the engine speed exceeding 1,050 revolutions even when the engine is running light. The char-a-banc shown was fitted with glass wind screen and an expanding hood, with side storm curtains, the whole being most tastefully finished. The chassis was the Albion standard 32-H.P. model, the gear box giving three speeds and reverse, with side chains for the final drive.

**Thos. Tilling, Limited.**—This old-established firm of motor hiring contractors and pioneers of the public service motor omnibus in London, have now entered the field as manufacturers, and have placed



**Tilling's 2-Ton Model Chassis.**

on the market two models entirely of their own design. It was not the original intention of Messrs. Tillings to manufacture these machines for sale, but merely to supply their own needs in running the mail and other hiring contracts for which they had become so well known. They have, however, been induced to do so by the large number of inquiries which they have had from intending purchasers of motor vehicles who have observed the successful running of the Tilling machines, and they have now made arrangements to sell or let on hire either type of vehicle, both of which were exhibited at Olympia. The two models have a number of features in common, and have been evolved from the practical experience gained in the running and maintenance of their own large fleet. Strength, neatness, and accessibility are the points that must appeal to those interested in the running of motor vehicles, and these are the three points that stand out boldly in the design of both these new machines. The 2-ton model, a drawing of the elevation and plan of which are here reproduced, has a well-designed 4-cylinder engine, developing 20 H.P. at normal speed. The cylinders are cast in pairs, 90 mm. bore, by 120 mm. stroke, with large interchangeable valves with adjustable tappets. The crank shaft is of the finest chrome nickel steel, running in three long white metal-lined bearings of large diameter. "Solex" automatic carburettor is fitted, and high-tension magneto ignition. The cooling system is by centrifugal pump, and the "Megevet" radiator is supported on special brackets to eliminate any straining action. Lubrication is by geared pump to troughs under the big ends and troughs over crank shaft main bearings. The transmission is effected by leather-faced cone clutch to gear box, thence by propeller shaft, having a universal joint at each end, to the worm-driven rear axle. The gear box gives four speeds and a reverse, with positive interlocking of all gears. The change is on the gate principle. Two powerful brakes are fitted, acting on separate drums on the rear wheels, the hand brake being of the external contracting type, and the pedal brake internal expanding. The back axle is made up of a cast-steel casing, reinforced by a chrome nickel-steel tube, machined from the solid bar, the front axle being a chrome nickel-steel stamping. In the case of the 1-ton chassis the engine has cylinders 80 mm. by 120 mm., and the gear box only gives three speeds and a reverse, otherwise there is a very great similarity between the two machines, although the weight of material in the heavier type is naturally in accordance with the load the vehicle is designed to carry. The finished vehicles shown on the stand were each mounted upon chassis of the new type, and gave visitors an excellent idea of the possibilities of each machine.

**Dennis Brothers, Limited.**—A good idea of the varied uses of the products of the extensive Guildford Works was given by the eight chassis—some fitted with bodies—shown at their stand. The most striking vehicle was an 18-H.P. double-bedded ambulance fitted with the latest design of stretcher, built to the order of the Metropolitan Asylums Board, at £500. Sixty-three of the same kind have now been supplied to the Board, which altogether has 100 motor ambulances in service. The company has just received an order from the Grand Duke Michael to supply a presentation ambulance to the Hampstead and North-West London Hospital. The bodies as well as the chassis are constructed in the company's works. Fire engines, for which Dennis Brothers are leading makers for the municipalities and private brigades, were represented by machines of 60, 45, and 30 H.P., with turbine motors, the capacity ranging from 400 to 150 gallons. The first and second models were built to the order of the London Fire Brigade and Basingstoke Council. The 30-H.P. specimen is an entirely new one, suitable for country districts and small brigades. An interesting exhibit was a 3-ton chassis which satisfies the War Office subsidy requirements. This is the only worm-driven type the War Office have sanctioned. A 2-ton char-a-banc of 35 H.P. was remarkable for its luxurious body. This and other machines of less

Digitized by Google

# MOTOR TRAFFIC.

horse-power can be fitted with single-deck omnibus bodies. A tilt van for furniture conveyance had two tons capacity, the engine being of 28 H.P. A notable exhibit was a 5-ton lorry of 40 H.P., four speeds, steel

Stand of Dennis Brothers, Limited.

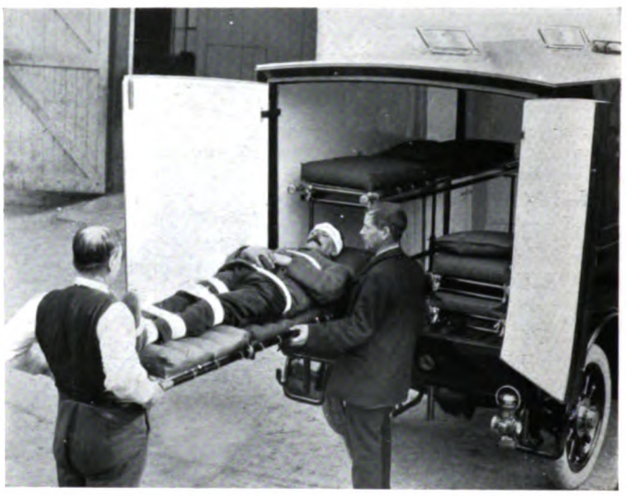
wheels, and a paraffin carburettor in conjunction with an independent petrol system.

**Austin Motor Company, Limited,** showed three models, 2½-ton lorry, 15-H.P. motor ambulance, and a 15-H.P. light delivery van. The first-named is the new low loading platform type with the lattice girder frame which has already been described in these pages. This attracted a considerable amount of attention on account of its radical departure from the usual practice in methods of construction, notably, the provision of two springs on each side of the rear axle, and the fact that each wheel is independently driven by means of a universally-jointed propeller shaft, at the end of which is mounted an enclosed

Austin Ambulance.

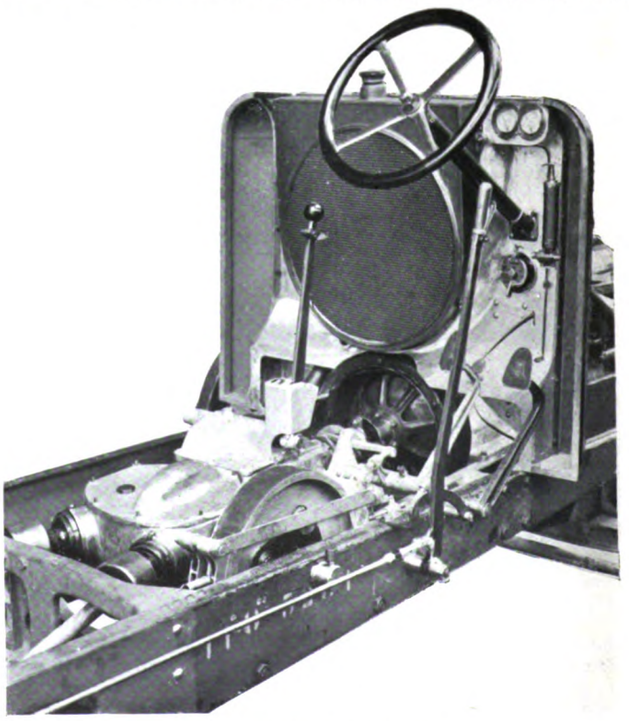
bevel gear acting on the wheel direct. The Austin ambulance is mounted on a 15-H.P. 4-cylinder chassis, and is specially designed for the painless transport of patients. It has a scientific equipment, with first-aid cabinet, and is arranged for loading four stretchers which can be elevated or lowered from the outside. The particular vehicle exhibited was built to the order of the Bolton Corporation, and we understand that similar machines have been supplied to the Metropolitan Asylums Board and the health departments of Manchester and Birmingham.

**Halley's Industrial Motors, Limited.**—Three of the five petrol vehicles shown were made for Colonial use. An encouraging sign of the ground which British makers have gained in this direction is that the Halley Company have found it necessary to issue a handbook of working instructions relating to their Colonial models. One of these, of 75 H.P., was the most prominent feature in the whole exhibition on account of its high clearance from the ground and the fact that the front axle has a pivoted form of construction enabling the axle and the wheel to surmount obstructions without interfering with the horizontal position of the chassis. The chassis carries eight tons; other features were four-speed gear box and epi-cyclic transmission gear, all enclosed in oil-tight and dust-proof chain cases. A special gear enables the vehicle to extricate itself from soft ground, etc. £1,200 was the price of this machine, which can be run on petrol or paraffin. Two of the other three exhibits possessed a Colonial feature. A 25-H.P. 30-cwt. chassis had the Colonial type engine with valves all enclosed, thermo-syphon cooling and 3-speed gear box with final drive by roller chains, enclosed in oil-tight and dust-proof cases, to the road wheels. To another 3½-ton chassis there was a 35-H.P. Colonial engine, with Colonial canopy over the driver, and specially large road wheels. A



Austin Ambulance in Use.

40-H.P. 5-ton chassis, fitted with box van body, had 4-speed gear box and final drive to the rear wheels by roller chains enclosed in Halley dust-proof and oil-tight chain cases. A feature of all Halley models is the fool-proof gear box, and the Colonial machines have the added



View of Austin Chassis.

advantage of the differential gear being cut out of action at will, thus preventing one wheel slipping when endeavouring to drive on soft ground.

# MOTOR TRAFFIC.

**David Brown and Sons (Huddersfield), Limited.**—This stand was devoted to the products of a firm who are specialists in worm-driven axles, steering boxes, and worm speed-reducing gear. Models which demonstrated the working of these inventions were also shown. All the exhibits were for use with commercial vehicles, both light and heavy, and including omnibuses and lorries. It is claimed that experience of the worm drive shows it to be the simplest for heavy vehicles, that it gives absolute quietness even when worn, increased strength and reliability, and a large range of reduction ratios in an axle casing of moderate dimensions.

**Belsize Motors, Limited.**—The exhibit of this firm embraced practically every branch of the commercial vehicle trade, from the 10-12-H.P. 5-cwt. van which sells complete, with lamps and horn, at £220, to the latest design 4-ton chassis at £650 with tyres. The 10-12-H.P. chassis has become deservedly popular among tradespeople and business houses all over the country, and is certainly one of the cheapest and most economical business cars made. The 4-cylinder engine, with the unique construction of clutch and gear box in one unit, has proved most successful with this van body, and these vans cost very little more to run than many of the three-wheeled runabouts which are on the market. They have been well taken up in London, and are being used extensively by the London *Evening News*, the *Daily Sketch*, etc. These firms are also owners of large fleets of the well-known 15-cwt. van which is fitted with a 14-16-H.P. engine, the *Evening News* alone running over 25 vans of this model. The 15-cwt. chassis has proved its reliability in all circumstances and in many countries. This has always been one of the most successful products of the firm. It sells at £310 for a chassis, and £360 complete with box-van body. The 30-cwt., 3-ton, and 4-ton chassis are models which are being seen in the South of England practically for the first time owing to demands in the North. They are all of the very latest design, and embody many improvements and ideas suggested by the many years' experience which the Belsize Company have had in manufacturing motors. They have made a great reputation for themselves in mail services and other heavy work in the Midlands and North. In addition, there was shown a greatly-improved model of the 14-16-H.P. cab of which several thousands are in use. This type is now fitted with four speeds forward, new lubrication system, 815 mm. by 105 mm. tyres, and new Sthenos carburettor, by means of which the petrol consumption has been greatly improved. The coach work also compares very favourably with the most luxurious types now being used in the London streets.

Belsize Light Delivery Van.

**De Dion Bouton (1907) Limited.**—This firm's exhibit comprised five types of vehicles ranging from a 40-H.P. double-deck omnibus down to an 8-H.P. light delivery van. The principal feature of the new De Dion Bouton omnibus is that it is of the "over" type, the driver's seat being placed over the engine, thus greatly economising the overall length. The 'bus is fitted with the "plate" clutch and the De Dion type of back axle, both of which features have been pronounced successes and greatly helped in the splendid results obtained by the London General Omnibus Company in the running their De Dion fleet. In this connection it is worthy of note that the London General Omnibus Company ordered 98 De Dion omnibuses in 1905, and that the Vanguard Company ordered a like number shortly afterwards, the latter, of course, being taken over by the London General Omnibus Company upon the absorption of the Vanguard Company. Of these vehicles, 115 are still in the daily service of the London General Omnibus Company, whilst those taken out of service in London are rendering good service in the provinces, a particular instance of this being the 16 now in regular service for the Eastbourne Corporation. Another interesting exhibit was a street cleaning machine built to the order of a Brazilian municipal authority. This was fitted up as a combined sweeping machine and watering wagon, and has an 18-H.P. 4-cylinder engine 90 mm. by 120 mm. This not only drives the car at a maximum speed of nine miles per hour, but also pumps the water to and from the reservoir, which has a capacity of 570 gallons. The pump is of the rotary type, and is driven from the differential. The water is discharged from the front of the machine, each nozzle is capable of covering a space of 45 ft., so that by using both nozzles a 90 ft. road can be watered at one operation. The power-driven rotary brush is placed under the centre of the chassis in a dust-collecting casing, and is driven by a flexible shaft. The brush can be removed when the machine is required only for watering purposes. There was also shown a 3½-ton chassis built to the requirements of the French War Office. This was fitted with a 4-cylinder engine, the cylinders being 100 mm. by 140 mm. Each of these machines were fitted with the "Solex" radiator, which appears to have become the standard for all the De Dion Bouton heavy types.

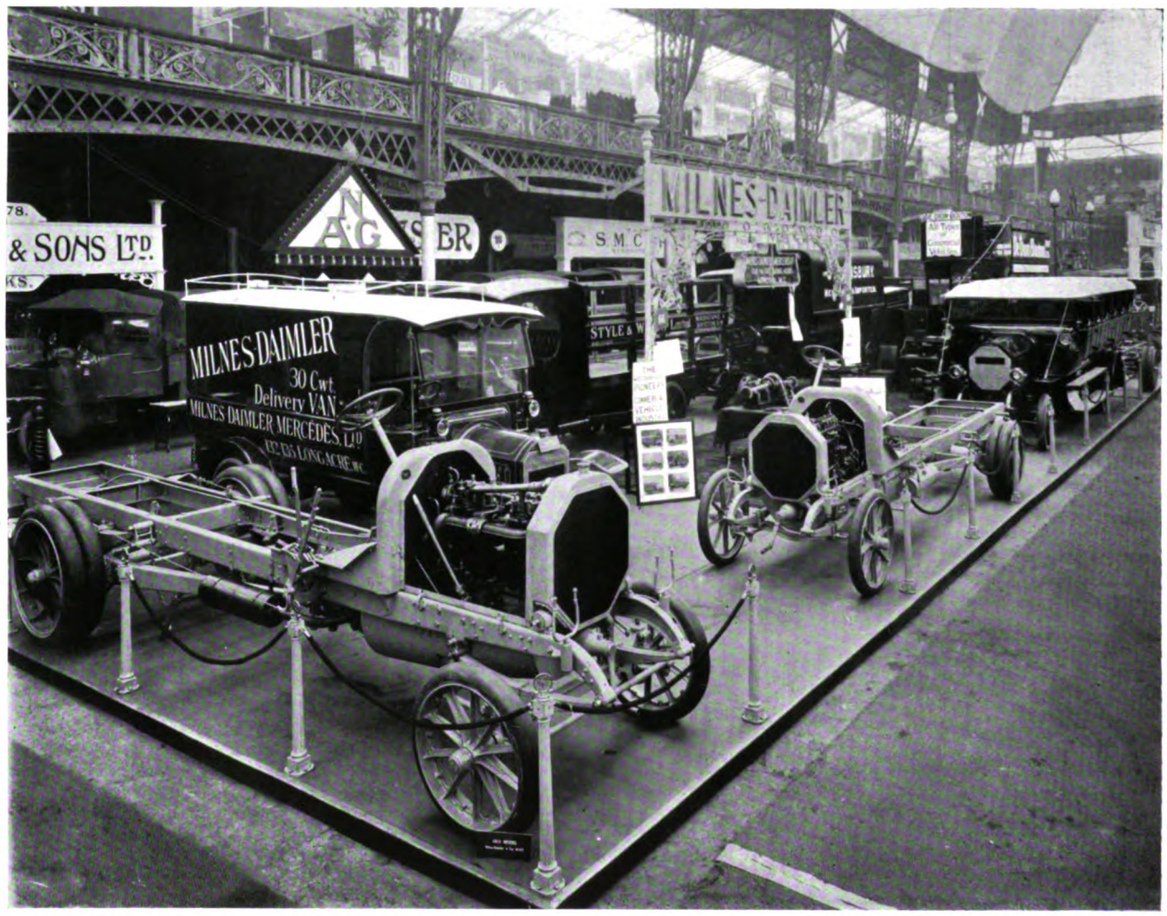
# MOTOR TRAFFIC.

**Berna Commercial Motors, Limited,** showed three of their 5-ton models, two fitted with open wagon bodies, and one bare chassis. The splendid record of this famous Swiss-built machine has evidently impressed a large number of people in its favour, judging by the attention that was paid to this stand throughout the run of the show. The special features of this machine is the great strength of all its component parts, and also its simplicity. When one remembers the fact that before being passed out of the factory each machine is thoroughly tested with an overload on the mountainous roads of Switzerland, it is not surprising to find them doing such good work in this country. Much attention was attracted by a wheel and pinion taken out of service after having run some 50,000 miles. The record goes far to prove the durability of the material used in the construction of this important detail.

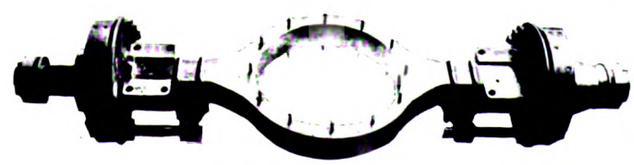
**Milnes-Daimler-Mercedes, Limited,** had an excellent display of their various models ranging from 45-H.P. 6-ton chassis to a 30-cwt. 20-H.P. delivery van. The two latest types of Milnes-Daimler chassis, viz., the 45-H.P. 6-ton and the 3-ton chassis deservedly attracted a considerable amount of attention. In the larger model the rack and pinion drive which has always been associated with the earlier Milnes-Daimler machines is retained, but in the 3-ton vehicle this has been replaced by a bevel-driven live axle. A feature in the design of both these models is the use of strong channel section perch bars, which are carried forward from the back axle to a point level with the universal joint immediately behind the gear box, thus forming combined radius and torque members. Accessibility to all wearing parts is made a strong feature in the design of these new types. A very handsome char-a-banc, mounted on a 35-H.P. engine, was a noticeable feature of this exhibit, as was the set of differential bevels displayed on the stand. These had been taken from a 5-ton van owned by James Nelson and Sons, which had been supplied to them in February, 1903, the vehicle having travelled a distance of 110,000 miles without any replacement of the transmission gear. The condition of the parts after this extraordinary service speaks well for the quality of the material used and also the accurate workmanship. In each of the models the engines are of the 4-cylinder type, cast in pairs, the valves being all of the overhead type. There is forced lubrication to all working parts.

**The Maudslay Motor Company, Limited,** showed three motor vehicles, two closed vans and a char-a-banc, besides three chassis. The char-a-banc is of the "Harrogate" pattern to seat 28; they are made to seat from 14 to 33 passengers, and cost with all extras (including doors on both sides) from £140 to £300, according to size and upholstering. The chassis of which we give illustrations is similar in general design to those under the closed van, and also to a number supplied to the Great North of Scotland and the Great Western Railways. The side members of the frame are rolled steel channels built up with steel tubular cross members. The whole frame is bolted together, no rivets being employed. The engine is of the standard Maudslay patented design of 40 H.P. on the R.A.C. rating.



**The Milnes-Daimler Exhibit.**

A leather to metal cone clutch is provided with Maudslay patent oil retaining plate; four speeds and a reverse are available. The drive in the back axle is in two stages, the first reduction is made by a pair of bevel pinions and the second by means of a pair of spur pinions. The whole



**Maudslay Back Axle.**

gear box is removed without trouble from the steel axle, and the box itself is easily taken apart, once it is removed from the axle. The back axle itself is of Maudslay patent weldless steel. The hand brake acts

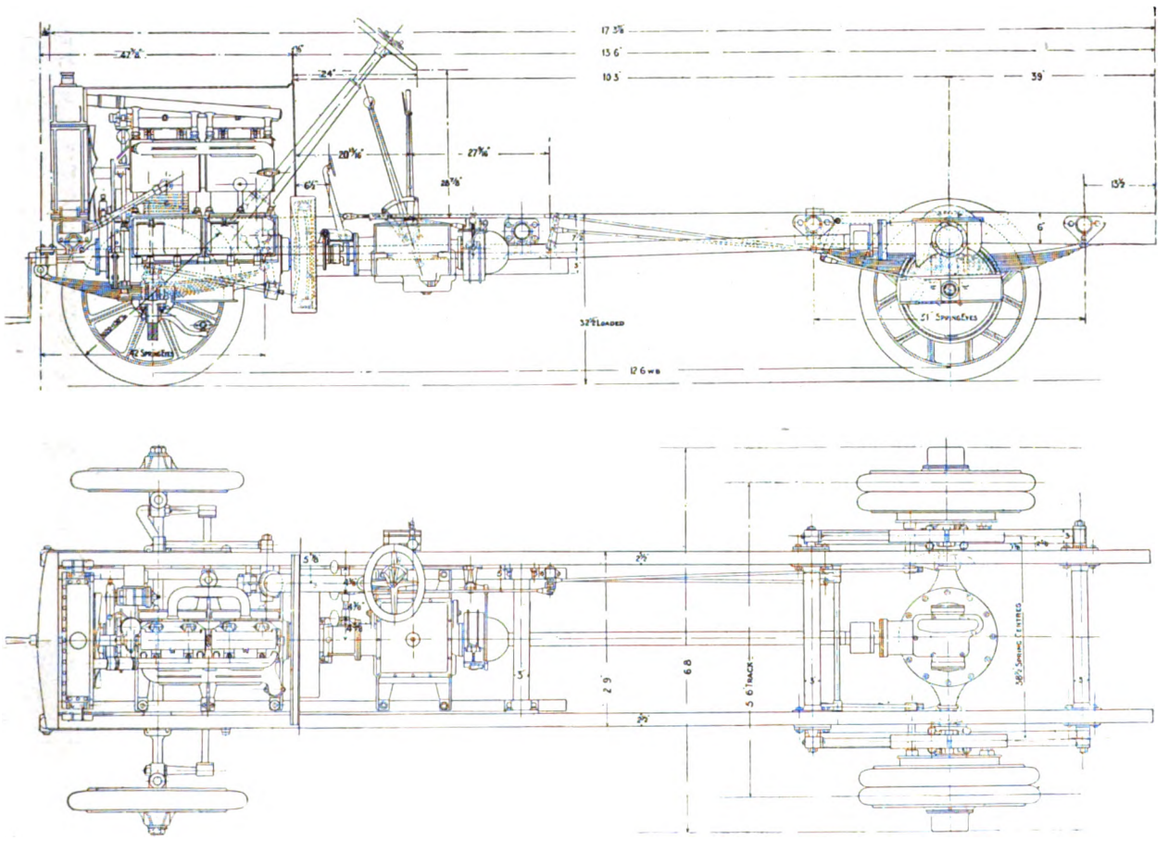
5-Ton Maudslay Lorry.



Plan and Elevation of Maudslay 5-Ton Chassis.

Digitized by Google

# MOTOR TRAFFIC.

through compensating levers on brake drums on the rear wheels. These are of the expanding type, and are completely protected from mud or dust. The front brake acts on a drum on the propeller shaft. Both brakes are easily adjusted and of ample power. The transmission is by propeller shaft, with universal joints at both ends and bevel-driven live axle. The 28-seated char-a-banc shown was mounted on a standard 3-ton chassis. This has a very luxurious torpedo type body, upholstered in real leather, and fitted with Cape cart hood and wind screen. The 30-cwt. box van, is a very suitable machine for carrying either perishable goods, or goods that might be damaged by dust or weather. It is coach-built throughout, and is mounted on a Maudslay standard 30-cwt. chassis. The 3-ton covered van is one of 12 supplied to Messrs. Lever Bros. Limited, of Port Sunlight, for distributing their goods to various parts of the country. Both the body and chassis have been specially built for heavy goods which will not stand exposure to weather.

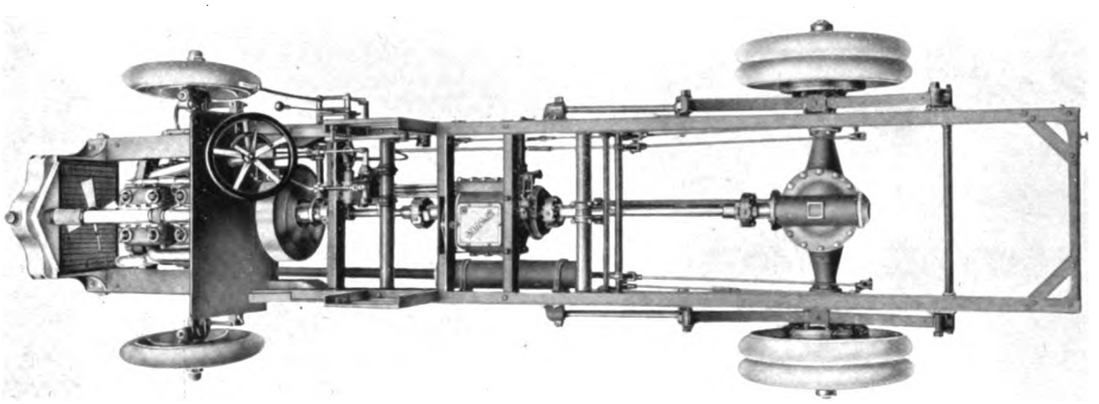
**McCurd Lorry Manufacturing Company, Limited.** The exhibit on this stand comprised a complete 40-H.P. chassis together with a separate engine, and all the vital parts of a chassis dismantled for the purpose of thoroughly demonstrating the exceptional care that has been taken by the designer to eliminate all possible cause of trouble in running and maintaining the machine in service. The exhibit attracted considerable attention not only from the visitors but from the motor manufacturers, a number of whom appeared to be very interested in the many details which differed considerably from regular practice. Unfortunately space will not permit us to deal as fully with this model as it deserves, and we shall endeavour on some future occasion to give a more complete description of the chassis. The whole design gives a clear indication of a careful study of the requirements of a machine intended for hard work with practically no skilled supervision. The outstanding features are a combination of large size transmission parts with moderate weight, accessibility to all wearing parts, the possibility of taking down any one part without disturbing others, and the ease of adjustment of all wearing parts. Moreover, the details in the system of lubrication are both efficient and practically fool-proof. The frame is of an alloy steel of heavy gauge and of pressed channel section, with cross members partly of tubular and partly channel section, a special feature being that all the shackle pins have oil boxes made as an integral part of the pin. The engine is of the 4-cylinder type, cast in pairs, 4½ in. by 5½ in., with valves of large diameter on either side. The water circulation is on the thermo-syphon system, with spring-mounted radiator of the gilled-tube type. The leather-faced cone clutch is supported on an extension of the crank shaft to which also the fly wheel is flange-bolted, a pair of ball bearings greatly facilitating the action of the clutch. By merely removing a few bolts the clutch can be withdrawn without interfering with any other part of the machine. The gear box gives four speeds and a reverse, and is fitted with an ingenious selector mechanism with a view to overcoming all gear changing difficulties. From the gear box the power is transmitted to the worm-driven back axle by a universally jointed shaft. Cast-steel wheels are fitted, and in addition to the ordinary foot brake and hand-lever brake acting on the rear wheel drums, an extra emergency brake is also applied to the rear wheel drums. The adjustment of all the brakes is by thumb screw, and can be instantly made when required.

**Durham Churchill and Company** had two specimens of their 45-50-H.P. models on their stand. The more attractive was the torpedo char-a-banc with seating arrangement for 22 passengers. This was a very handsome machine, and was built to the order of the Yorkshire Motor Car Company.

**New Girling Commercial Cars, Limited,** had a most interesting display of their light delivery vans mounted on their special 3-wheel chassis. These were all fitted with 6-H.P. engines, and varied in carrying capacity between 3 and 5 cwts. In these cars the driver sits in front and thus has a clear view of the road. The cardan shaft transmission with the bevels running in clear grease takes the place of the chain. The engine is water cooled through a large front radiator. Steel artillery wheels, which are used, are detachable and interchangeable. Bodies can be provided suitable for all businesses, and prices range from 100 guineas upwards. The Girling commercial traveller's vehicle with detachable box for samples is a specially convenient car.

**Shrewsbury and Challiner Tyre Company, Limited.**—The special feature of the exhibit on this stand was the heavy cross-ribbed tyre which has been designed for fire engine work. It is claimed that the special formation of this tyre makes it impossible to skid. The success of this form of tyre has encouraged the firm to manufacture it in lighter sections, two of which were also shown on their stand.

**S. Smith and Sons, Limited,** exhibited a large range of specialities of interest to users of motors of all classes. These embraced lighting outfits for industrial vehicles, both for the use of electricity and acetylene. The "Eureka" carburettor was also shown, and we understand that most excellent results have been achieved with this on all types of heavy machines.



Plan View of McCurd Chassis.

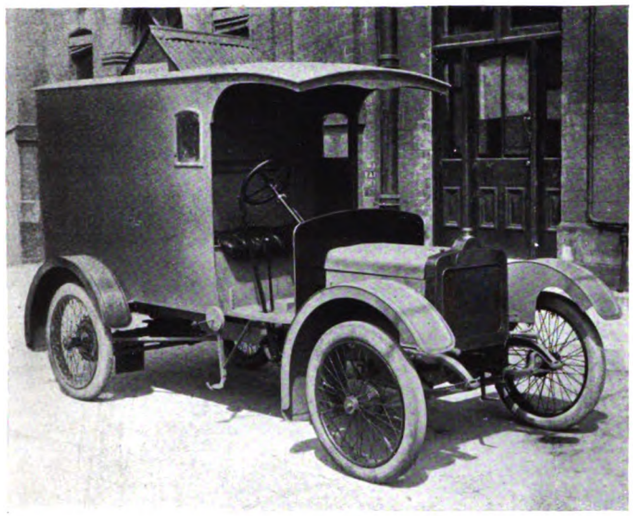
Daimler Char-a-banc.

**The Daimler Company** have entered the delivery van field with the smart 10-cwt. vehicle shown in the accompanying illustration. The chassis which was shown at the exhibition is a very interesting

Digitized by Google

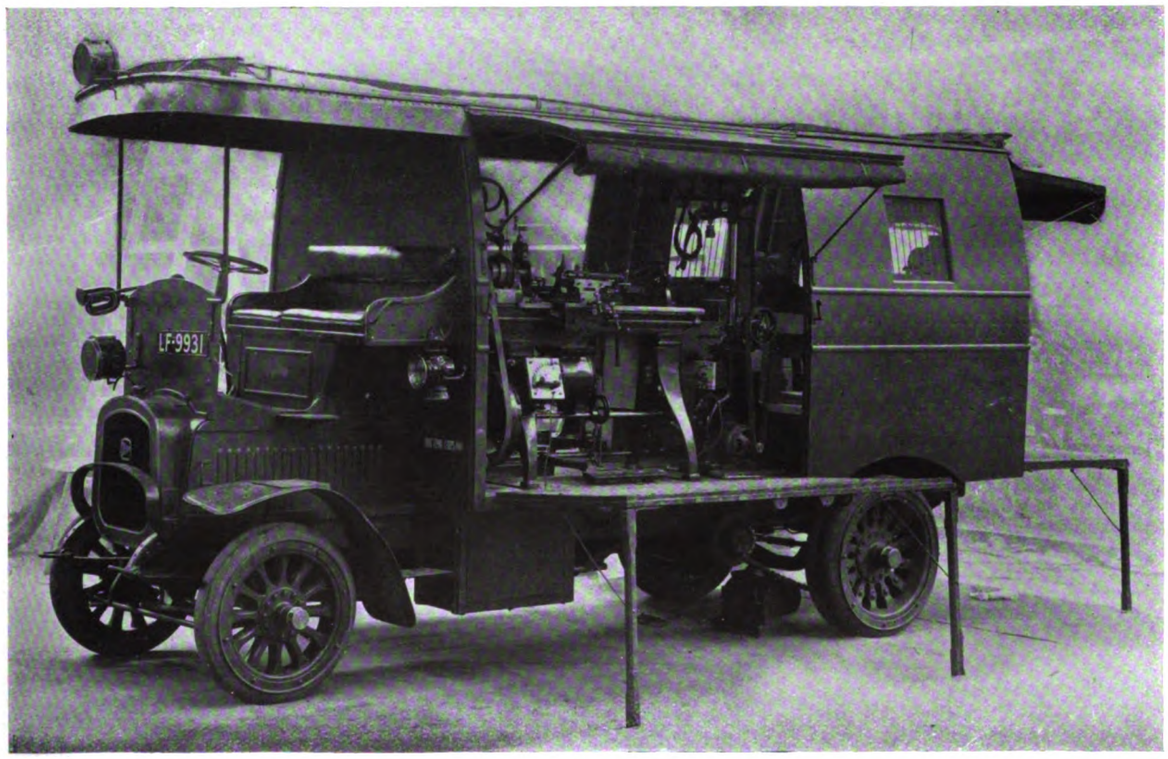
# MOTOR TRAFFIC.

production embodying some special features. The key-note of the design is its simple construction and control Any youth who has been considered sufficiently intelligent to manage a horse delivery van should be able to gain the necessary skill in handling this Daimler "express" after three or four days' tuition. The engine



New Daimler Light Van.

is, of course, of the sleeve-valve type. As far as ordinary running is concerned there should be no need of any attention from the driver other than the weekly filling up of oil. A cone clutch conveys power by means of a propeller shaft enclosed in a universal joint to the engine, the driver has now only one unit. Secondly, the usual transmission losses in the universal joints are cut out. Thirdly, there is an entire absence of noise from the transmission gear which results in the added advantage of silent running; this must be counted an important point from the advertising value of the delivery van. Nothing is so likely to create a favourable impression as a well-finished silent-running van of this type. This is so well appreciated that many small firms, whose deliveries are really not sufficiently extensive to warrant the introduction of an express motor van on the grounds of cheaper running cost alone, are purchasing these little vehicles simply on account of their advertising value. Both brakes are situated on the rear wheels, and these are powerful enough to meet all the requirements of traffic running. A most important feature is the fitting of detachable wheels, so that chance of delay on the road is absolutely minimised. The control of the van has been simplified to the fullest possible extent. The speed control is entirely by a foot accelerator, and the gear change and brake levers have both been arranged in a position which can be reached naturally by the driver without any exertion. The standard form of van body is a neat production, with the following inside dimensions: 4 ft. 5 in. in height; 3 ft. 9 in. in width; and 5 ft. 1½ in. in length. Internal shelves are fitted when required. Not the least important feature of this van is its light weight, which means, of course, that running costs are proportionately reduced. The chassis weighs about 12 cwt., and the complete vehicle approximately 16½ cwt. Completely equipped with spare wheel, 815 mm. by 105 mm. Dunlop tyres, and full set of tools, the Daimler van sells at a price which brings it well within the range of all retail houses whose present business demands the employment of two or more horsed vehicles. Other exhibits on the Daimler stand, which attracted most interest from the general public, were a 3-ton lorry chassis, showing its working parts, after having been in use 9 months, and the separate parts of a 'bus, which had run a distance of 23,000 miles. The chassis had been opened up so that the visitors could see the condition of each of the working parts after service. An interesting arrangement for drawing attention to each feature of the design was erected over the chassis, and by means of coloured cords



Delahaye War Office Motor Workshop.

torque tube to the rear axle, in the forward extension of which is situated the gear box. The advantages of this construction are three-fold. In the first place, the number of units in the power plant is reduced to two instead of three, that is, instead of having a gear box and a separate back axle to keep lubricated in addition attached to an indicator and the individual parts the special features were made exceptionally clear. A considerable amount of business was transacted with omnibuses and lorries. The new light delivery van also found favour with a large number of visitors, much business also being done with this type.

# MOTOR TRAFFIC.

**Delahaye and Company, Limited,** staged four models of exceptional interest, chief amongst them being a travelling workshop fitted with a lathe, drilling machine, milling machine, band saw, vices, forge, anvil, etc. Each of the machines is electrically driven, and the vehicle

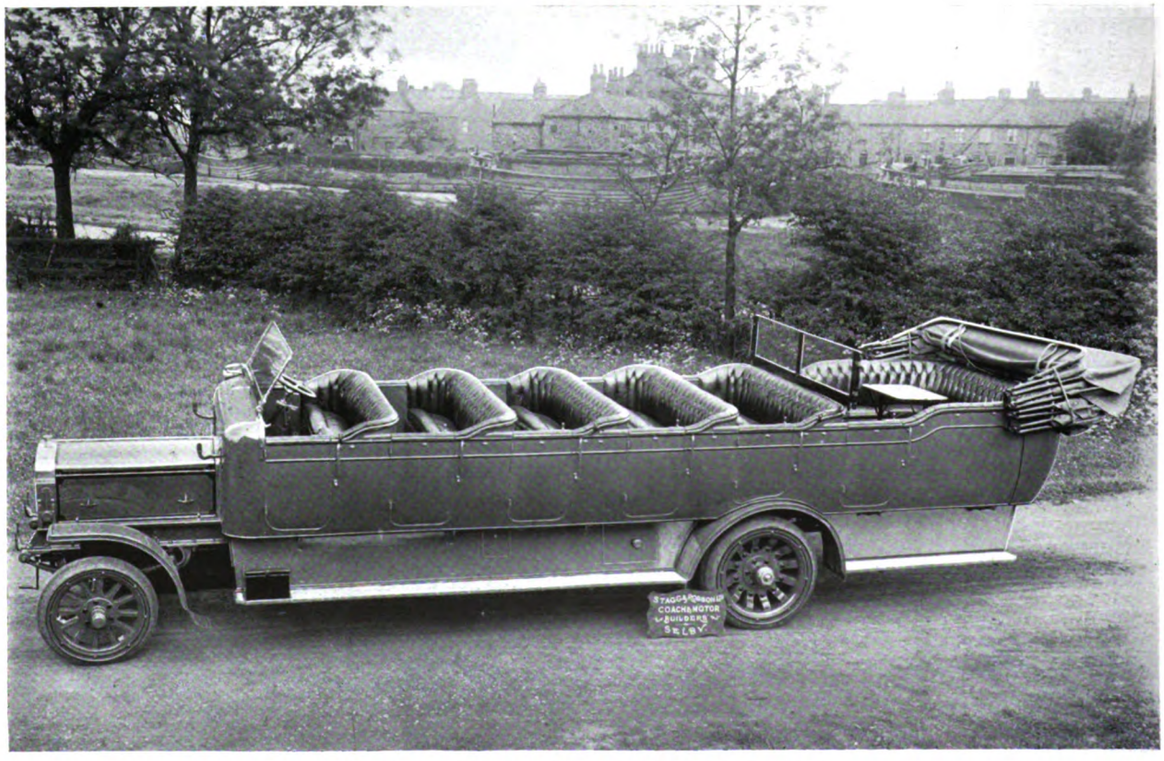
A Corner of the Show.

is designed for military purposes. The hinged sides constitute the platform upon which the engineers work, and, as will be seen by our illustration, the whole machine is most compact in appearance.

**Stagg and Robson, Limited.**—This firm, who have their works at Selby, staged two cars, a 20-seater 40-H.P. passenger vehicle for Colonial use, and a 15-seater 16—18-H.P. car. The chassis, which are of the now well-known "Economist" type, are free from complications. In the case of the 40-H.P. car, the engine mounted is the new type with roller bearings. The chassis is excellently sprung upon long span laminated springs, the rear springs being furnished with shock absorbers. The coachwork is an excellent example of the high capacity touring car, which is a speciality of the company. The small car, which is similar in design as regards the chassis to the one above described, differs only with respect to the engine, which is an "Aster,"

Clayton and Company's Stand.

the reputation of which needs no comment. The coachwork, which is neat in outline, provides for 14 passengers and driver. Upholstered in pleated and buttoned scarlet leather, with comfortable sprung seats and backs, this type of small car should prove very popular. In addition to the exhibits on their stand, Messrs. Stagg and Robson also supplied a large number of their high capacity touring car bodies to other chassis builders, notably amongst which is the Daimler Company.



Stagg and Robson Public Service Touring Car.

"Tylor," giving an ample range of power for heavy work over hilly districts. The drive is effected by means of silent side chains, and the gear box, which has four speeds forward, is practically fool proof, all the gears being made of special steel, carefully hardened and provided

**De Nevers Rubber Tyre Company.**—This old-established firm of rubber manufacturers were showing the De Nevers continuous band tyre in various sections and sizes. The form of construction was also demonstrated.

Digitized by Google

# MOTOR TRAFFIC.

**The Midland Rubber Company, Limited,** showed specimens of all types of "Midland" solid and pneumatic tyres, varying in sizes and patterns. Solid band tyres are standardised in three distinct sectional designs, viz., square tread, round tread, and concave or "T" pattern. The exhibits included solid band tyres up to 170 mm. section, suitable for heavy steam traction work; grip or clincher solid tyres for light commercial motor work; grooved, ribbed, and steel-studded "Midland" and "Britannic" pneumatic tyres manufactured specially for commercial purposes; and specimens of wheels, steel felloes, and flanges, single and twin type, complete with tyres, suitable for various classes of work. The firm were also showing two band tyres which have returned from the London General Omnibus Company after running the following mileages: Tyre No. 3,263, which has run 36,818 miles, and is still good for further mileage. Tyre No. 3,235, which has run 35,696 miles. The figures prove conclusively that these tyres put under good conditions and with careful driving can run over three and a half times their guarantee. There is a tyre still running for the afore-mentioned company which up to the present has run 37,558 miles. They have over 500 tyres with mileages from 20,000 to 35,000. It will be interesting to many to learn that the Midland Rubber Company are the contractors for the supply of band tyres to H.M. War Office.

"Tramway and Railway World" Stand.

**The Continental Tyre and Rubber Company (Great Britain) Limited.**—The leading feature of this exhibit was the famous "Continental" "T" pattern solid tyre. This is the original "T" section tyre, as opposed to the "round" pattern, the chief advantage lying in the fact that the wearing surface remains practically the same width from the beginning to the end of the tyre's life, thus insuring with the extraordinary resiliency the extra mileage, on which the Continental company principally base their claims. It is interesting to note that over 34 per cent. of the vehicles exhibited on the stands were fitted with the company's "T" pattern tyre. Sections and complete tyres, as well as the "Continental" twin solid tyre wheel, were shown, and full particulars obtainable. Users of the lighter types of delivery vans showed considerable interest in the Continental twin detachable rim for pneumatic tyres. The twin rim is quite as simple in operation as the now famous "Continental" single detachable rim. A record was kept of nearly 700 "T" pattern tyres, used consecutively on Messrs. Tillings' motor omnibuses, and the average was over 20,000 miles per tyre. These tyres are largely used throughout the country. Visitors were invited to ask for the company's souvenir booklet, "All about the 'Continental' Solid Tyres," in which was to be found a great deal of information regarding the wearing qualities. The drivers' bonus scheme, inaugurated by this company some two years ago, has proved a great success. Many hundreds of bonuses have been paid, and owners have expressed their hearty approval of the scheme in practice.

**Charles Macintosh and Company, Limited,** made a feature of a collection of used tyres which were piled up one on the top of another in the front of their stand. On each of these the mileage record was painted, and as the records ranged from 17,000 to 41,000 miles, it will readily be understood that visitors concerned in the running of heavy vehicles were very much interested.

**J. and E. Hall, Limited,** included five distinct models in their exhibit. These included machines for all kinds of service, and were in themselves excellent examples of the output of this old-established firm of

Halford Char-a-Banc.

engineers. A brief description of the exhibits is as follows: 5-ton tipping wagon: This was a screw-operated hand-tipping wagon, and is the fourth of its kind to be delivered to the Sheffield Corporation. It is fitted with a 32-H.P. 4-cylinder engine. 4-ton brewer's wagon: This had a skeleton-sided lorry body with overhead sign, mounted on one of the "Hallford" standard 4-ton chassis, fitted with 32-H.P. engine. This is the sixth of this type that they have supplied to Messrs. Watney, Combe, Reid, and Company, Limited, the brewers, and they have recently received an order for a further two. 2½-ton box van: This was one of two to be delivered to Messrs. J. Robertson and Sons, Catford. The body (a box van) is enamelled light green, and is mounted on one of their standard 2½-ton chassis, fitted with a 25-H.P. engine. 3-ton chassis: This is the "Hallford" standard 3-ton chassis, fitted with 32-H.P. 4-cylinder engine of 110 mm. bore and 140 mm. stroke. Char-a banc: This was a flush-sided torpedo type of char-a-banc with fixed canopy. The seats are leather upholstered, and the vehicle will carry 22 passengers very comfortably. All the metallic

Continental Tyre Company's Exhibit.

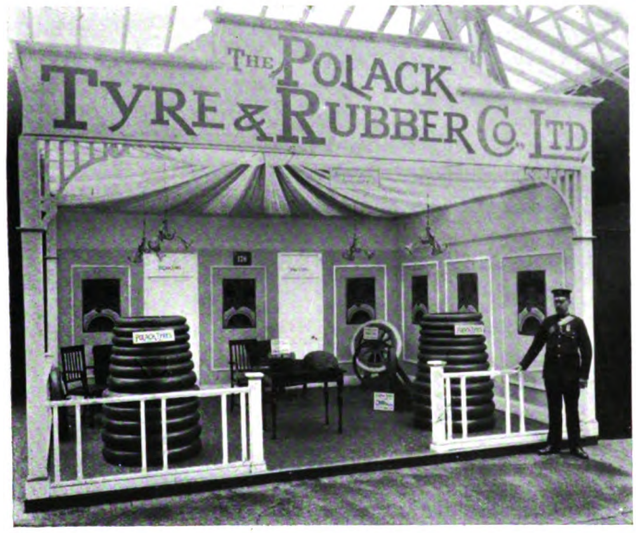
Digitized by Google

# MOTOR TRAFFIC.

fittings are nickel-plated, and the vehicle is finished in a delicate shade of French grey. The chassis is fitted with a 32-H.P. engine, which will enable the vehicle to negotiate the stiffest hills with perfect ease. This char-a-banc is a remarkably fine piece of workmanship, and was greatly admired by visitors to the show. Fire tender: This included extension ladder, gas bottle, hose reel, hose boxes, and all necessary appliances for rendering first-aid in case of fire. The chassis is one of their standard 30 cwt., but fitted with a 32-H.P. engine, which will enable the machine to take the stiffest hills at a good speed.

**The Hillman Motor Car Company, Limited,** had an interesting exhibit which included one 10-H.P. Hillman wagon chassis, fitted with box van body and wheels, with Dunlop grooved tyres; one chassis of the same type but with a smaller body; one chassis fitted with wagon body and detachable canvas top, and one 10-H.P. Hillman wagon chassis.

**The Polack Tyre and Rubber Company, Limited.**—Prominently displayed upon this stand was a set of tyres removed for exhibition purposes from a 2-ton Commer car after running 2,700 miles, and from their present condition it was obvious that they were good for several thousand miles more. A complete range of solid tyres were also shown; these included the smaller section made for light delivery vans, up to the larger sections suitable for steam wagons and the heaviest forms of motor traction up to 12 tons. Samples were also shown of the finest Para rubber used in their manufacture. A special



feature was also made of the lagging method of fitting Polack tyres in the Colonies and places where customers have not the facilities afforded by the tyre press. A wheel fitted with lagging strips of hard timber between the felloes of the wheel and the steel band of the tyres served to illustrate the method of operation. The strips of timber are slightly wedge shape, and are forced between the felloe and steel band by means of a detachable band screwed into position by a number of bolts placed at regular intervals round the face of the band. We understand that this method of fitting tyres has been in operation for some months with complete satisfaction.

**Electric and Ordnance Accessories Company, Limited.**—The special feature in this stand was the "Timken" roller bearing, which is designed to take the thrust as well as the radial stresses. A large range of sizes were shown suitable for practically every type of vehicle.

**B. F. Goodrick Company, Limited.**—An interesting exhibit on this stand was a model of the firm's demountable wireless solid tyre, which was shown in twin form on a wood wheel.

**J. Liversidge and Sons, Limited,** were represented in each section of the exhibition. On the ground floor they staged some excellent specimens of their body-work which both for soundness of construction and finish was all that could be desired. In the gallery they showed the Liversidge solid tyres in plain band form, notched tread, and grooved tread. These were displayed both fixed to wheels and separately.

**The Dunlop Rubber Company, Limited,** had a most comprehensive display of heavy service solid tyres, including a special tyre for use on all types of commercial vehicles, intended to give the maximum resiliency whilst offering the greatest resistance to the destructive tendency of service upon indifferent roads. It is made in all the sizes enumerated in the company's trade list. The Dunlop pneumatic motor tyres were also shown in all of the company's well-known types which are intended for and largely used on delivery vans, and the lighter types of commercial vehicles generally. The Dunlop solid tyre, as fitted upon most of the largest fleets of public service vehicles in the country, is too well-known to need comment here, but some evidence of the service given by these tyres is afforded by figures which the company has recently published relating to the large numbers of tyres running upon various fleets of public service vehicles operating in London. In these cases the tyres are supplied on a basis of payment for mileage run. Exact records of this mileage are kept by the companies owning the vehicles. These records show that the mileage for the whole of the Dunlop solid tyres referred to give an average for all sizes, including both back and front tyres, largely in excess of the 10,000 miles' service for which all Dunlop solid tyres are guaranteed. The figures cover no less than 5,409 Dunlop solid tyres, which have completed the above satisfactory service during the present year. The company showed for the first time a new solid tyre which has been produced specially for commercial vehicle work on provincial roads. This tyre will be known as the Dunlop "heavy service" solid tyre. It is suited to all types of commercial vehicles, and will be found to combine with the maximum resiliency the greatest durability and capacity for standing the exceptional wear due to heavy loads and hilly and indifferent roads.

**J. I. Thornycroft and Company, Limited,** included a new type of lorry in their exhibit, which had been designed to comply with the War Office requirements for subsidy vehicles. This machine, which is capable of carrying a gross load of 4½ tons, has a tare weight of about 2½ tons. The engine is of the 4-cylinder type, cast in pairs 4½ in. by 5 in., with the valves arranged on either side. A 4-speed gear box is fitted, giving speeds of 2¾, 5¼, 8¾, and 15 miles per hour, the casing being made of forged mild steel. From the gear box the power is transmitted by a propeller shaft running in a torque-tube to a live back axle. The reduction gear and differential are all contained in a casing bolted to the dead axle, which is a steel forging carrying the entire weight of the vehicle. A double reduction is used in the live axle, the propeller shaft transmitting the power to a short countershaft by spur gear. An external foot brake is provided on the propeller shaft, and internal expanding brakes on the back hubs operated by hand lever. A "Colonial" model originally designed for the Japanese Government was also shown on this stand, and attracted considerable attention. The engine in this model is the same as described above, the final drive, however, is by side chains, and the gear box gives only three speeds.

**Christopher Dodson, Limited,** had some excellent specimens of body work on their stand. These included the latest type of London omnibus which was illustrated in our issue of July 10 and which has just commenced service. This body found much favour with a number of provincial tramway authorities, and we understand that definite orders were placed at the show for a number of similar vehicles. Another attractive exhibit was a convertible char-a-banc to seat 25 passengers, built to the order of the London and North Western Railway Company. The seats are arranged in tiers, so that the vehicle is admirably suited for town and country sight-seeing. All the windows are detachable, and there is a complete electric lighting equipment.

**C. A. Vandervell Electric Lighting.**—For many years C. A. Vandervell and Company's electric lighting sets have stood the test of use in private motor cars, and they have now made a most successful bid for public passenger and commercial vehicle lighting. A little over 12 months ago it was a reproach to London motor 'buses that their lighting was not very good. Now, in at least 300 of the London General omnibuses the lighting rivals the illumination of the tramcars, shedding its brilliancy over many a poorly-lighted suburban road, and being as effective a deterrent to the would-be housebreaker or footpad as a large addition to the police force. A complete C. A. Vandervell lighting equipment was exhibited in a motor omnibus body. Other features were electric lighting sets for commercial vehicles, and the C. A. Vandervell-Ruttardt magneto, especially suited for commercial vehicles.

**Simplex Rubber Company, Limited,** exhibited a wide range of solid tyres, and a pair of front and back cast-steel wheels fitted with their tyres for a Straker van, and also a pair of heavy steam wagon wheels fitted with their heavy pattern tyres, designed for the heaviest of transport work.

## IMPERIAL MOTOR TRANSPORT.

IMPORTANT CONFERENCE IN LONDON.

Great success attended the happy idea of holding an Imperial Motor Transport Conference in London from July 18 to 25, the period of the Commercial Motor Exhibition organised at Olympia by the Society of Motor Manufacturers and Traders. The Executive Committee of the Conference included representatives of the Army Council, the Dominion and Colonies, the various automobile organisations, the London General Omnibus Company, and the Society of Motor Manufacturers and Traders. Prince Arthur of Connaught kindly acted as president, the chairmanship of the Executive Committee was undertaken by the Hon. Arthur Stanley, M.P., and the duties of hon. secretary were in the capable hands of Mr. Horace Wyatt, who was assisted by Mr. David Bell and Colonel C. C. Townsend, R.A.

Among the delegates were representatives of the Government civil departments, military forces, railways, chambers of commerce, and various industries of India, Canada, Australia, South Africa, New Zealand, Crown Colonies, and Dependencies. Numerous interests within the British Isles also sent representatives, including municipal authorities.

On July 18 the delegates attended the opening of the Olympia Exhibition by Prince Arthur, who also discharged the arduous task of receiving the delegates individually. Subsequently they were entertained at luncheon by the Society of Motor Manufacturers and Traders, when Prince Arthur proposed "The Industry," and remarked that the large attendance of Colonial visitors reminded him of the great and growing Colonial market which existed. Mr. F. S. Edge, president of the society, in responding, referred to the wonderful progress which the industry had made since the last show in 1908. The exhibition had succeeded beyond the dreams of the greatest optimist. Mr. E. Manville proposed "The Visitors," and the Hon. A. Stanley, in reply, referred to the interest which the Government had shown in the exhibition, and he expressed the hope that such events would become a permanent feature of the industry. In the afternoon the delegates inspected the exhibits.

Appended are excerpts from the various papers which were read, and the decisions arrived at by the Conference, which sat at Olympia on July 21, 23, and at the Royal Automobile Club on July 25.

### PETROL SUBSTITUTES.

Sir BOVERTON REDWOOD, Bart., and Prof. VIVIAN B. LEWES, read the first paper at the opening sitting on July 21. It was entitled "Petrol Substitutes for Use in Motor Vehicles." The authors stated: The present high price of petrol, and the apprehension of increasing scarcity, with even higher resulting cost, has naturally directed attention to the question of possible substitutes, obtainable in adequate quantity at moderate cost It may be desirable as a preliminary step to dismiss from consideration the popular impression that the high price of petrol is mainly due to trade combinations and artificial restriction of output, and to recognise that the advance in cost has been directly brought about by the gigantic increase in consumption. Since 1905 the imports of petrol into England had risen from 18 to 80 million gallons, and it is probable that the consumption this year will amount to 100 million gallons. In America the demand has increased at an even greater rate, and the same conditions exist in all European countries. Spain, and to a great extent Germany, have no oil fields at home to supply the local demand, and are therefore dependent upon the surplus over and above that needed for home consumption in the countries that have oil fields. The 80 million gallons used in the British Isles last year were drawn from the following sources: Dutch East Indies, 46 million gallons; America, 16 million gallons; Russia, five million gallons; Roumania, four million gallons; other countries, nine million gallons; so that more than half our supply came from the fields of the Royal Dutch and Shell Companies, whilst the American supply, which, up to five years ago, was our chief source of petrol, had now shrunk to one-fifth of the total. With regard to the petrol supply, it must be borne in mind that last year the world's total production of crude oil amounted to 50 million tons, and that the growth in the production of crude oil has less than doubled itself since 1905, whilst the demand for petrol has more than quadrupled. Another factor which has tended to increase the price has been that we have been suffering from insufficient transport facilities, but that the excess of demand over supply is the chief factor is shown by the very high price of the crude oil at the oil fields. In these circumstances it is of the highest importance to find some other source or sources for a considerable proportion of the motor spirit needed. The only sources from which this is likely to be obtained are: 1, Those portions of crude petroleum other than the petrol fraction; 2, products of the destructive distillation of coal and shale; 3, products of fermentation.

HOW PUBLIC AND TRADE VEHICLES CAN EFFECT A SAVING.

After discussing the yield of motor spirit from crude oil, the authors said: The carburettor, which is the all-important factor, has received a smaller amount of attention than it deserves, and much may yet be done in the direction of making carburettors better adapted for use with the heavier grades of petroleum products. For many years past attempts have been made to use for motor purposes the fraction of petroleum having a specific gravity of about 0·8 which is usually employed as lighting oil, and many patents have been taken out for making motor spirits composed of such oil mixed with sufficient petrol to give the necessary volatility to start the engine. A study of these patents reveals the fact that in most cases the patentee uses a mixture of about 40 per cent. of petrol with kerosene of a specific gravity of 0·8, and depends for the novelty of his invention upon the introduction of various substances intended to aid the *pro rata* evaporation of the heavier portions of the mixture. With several forms of carburettor on the market, such a mixture gives excellent results when used under uniform conditions, but it lacks the elasticity necessary for congested traffic, where constant slowing down, stopping, and restarting are requisite, and is apt to give rise to starting troubles in cold weather. These objections have been met by providing a small supplementary feed tank containing petrol, which is used for starting the engine and keeping it running until the system is warm, when the main tank, containing the mixture or even ordinary lighting oil of a specific gravity of 0·8, can be connected, and the running continued satisfactorily until the need for stopping occurs, after which the petrol is again turned on to give the necessary starting power. By the adoption of such methods the requirements of the public motor vehicle and trade wagon can be met, with a saving of 20 to 40 per cent. in the consumption of petrol.

A PLEA FOR HOME-PRODUCED ALCOHOL.

Adverting to the products of the destructive distillation of coal and shale, the paper stated: At the present time there is no commercial process working on a large scale which will yield more than the three gallons per ton of coal carbonised that can be obtained from coke oven practice, and the total amount of benzene so recovered will amount to about 8,000,000 gallons per annum, a large proportion of which is exported. Much might be done in the direction of replacing the bee-hive coking ovens, that still exist to a very large extent in the north of England, by recovery ovens, but as matters at present stand the amount of benzene available is so small that any large demand would cause it to rise in price even more rapidly than petrol has done. The Scotch shale oil industry is another source from which motor spirit might be obtained, but the 600,000 gallons which represent the annual output of distillates fitted for this purpose is only about 0·75 per cent. of the total petrol used last year, and a considerable proportion of this is marketed for solvent purposes. The heavier portions of the shale oil, however, lend themselves to cracking purposes, so that unless these fractions are all absorbed for fuel oil they might in the future prove a source of supply.

The authors concluded: It must be borne in mind that any petrol substitutes made from petroleum, coal, or shale are only obtainable in a limited quantity, for in each case the store of raw material is in process of depletion. On the other hand, alcohol is a motor spirit which can be continuously manufactured in any required quantity, and if the Imperial Motor Transport Conference only realises this fact and uses its influence in the first place to stimulate the designing of an engine and carburettor best fitted for use with this liquid, and,

# MOTOR TRAFFIC.

secondly, to induce the Government to give the necessary facilities for the manufacture and use of methylated spirit for the purpose, it will have done much towards giving this country a home-produced source of power of which no foreign entanglements can rob us.

By fermentation in bulk, continuous distillation, and judicious methylation, all the motor spirit needed can be obtained and sold at something like 1s. a gallon, and the extended researches of the United States Government have shown that engines can be satisfactorily run on alcohol, whilst in spite of the calorific inferiority of alcohol practically the same power is generated as with petrol, owing to the cooler cycle, smaller quantity of air required, and greater compression that can be used without fear of pre-ignition. Thousands of acres of land fitted for the growth of potatoes and beet are lying idle in Ireland and even in England, and when it is demonstrated to the satisfaction of the Government that the motor is ready for the new fuel, the required facilities could no longer be withheld.

IMPORTANT DECISION BY THE CONFERENCE.

Mr. A. W. SOUTHEY submitted a proposal, which was seconded by DR. LESSING, to the effect that an adequate amount of spirit could be obtained from coal-tar oil. This, however, was negatived.

The Conference adopted the following resolution, on the motion of Sir BOVERTON REDWOOD: "That having regard to the high price of petrol and the limited quantities of petroleum, coal, and oil shale available, and the obvious fact that these sources of volatile liquid hydrocarbons are in course of depletion, it is desirable that attention should be directed to the construction of a motor suited for use with alcohol, and that, concurrently, action should be taken with a view to the ultimate creation of an adequate supply of fuel obtainable at a sufficiently low price."

It was resolved that a committee should be appointed to further the idea and to suggest ways and means.

## STANDARDISATION FOR MILITARY PURPOSES.

On July 23 Colonel H. C. L. HOLDEN, C.B., F.R.S., late R.A., in the course of a paper on "The Standardisation of Mechanically-Propelled Vehicles for Military Purposes in Time of War," said: The object of the present paper is to deal with the vehicles themselves, their type and details of their design, having special reference to the requirements which have to be met in order to make them suitable for military purposes. The experience of the last eight or ten years has proved that the lorry driven by an internal combustion engine using petroleum spirit or similar fuel is the one which best fulfils not only commercial requirements, but also the needs of the transport columns of the Army. Up to the present all practical vehicles driven by steam engines have required a comparatively large amount of water after traversing a few miles. On the other hand, the internal-combustion-engined vehicle requires very little water, and that only to make up losses occurring in most cases from accidental causes. The adoption of a commercial vehicle suited, as this is, only to ordinary roads practically confined the operations of the military transport when using these vehicles to the same roads, and any distribution of stores involving going across country will have to be effected in the usual manner by means of horse transport. The types of mechanically-propelled vehicles which have been selected as most suitable for military purposes are two in number—internal-combustion-engined lorries, having wheels shod with solid rubber tyres, and carrying useful loads of 3 tons and 30 cwts. respectively. The 3-ton vehicles are officially designated as coming under Class A, the 30-cwt. type under Class B. The author dealt at length with the requirements which have to be fulfilled by subsidised vehicles, and mentioned that already quite a number of the principal makers of lorries have submitted vehicles to the trials which have been held by the War Office, and have been successful in having their vehicles approved as types which will be subsidised if and when required.

## VEHICLES REQUIRED ON MOBILISATION.

Capt. A. E. DAVIDSON, R.E., secretary of the Mechanical Transport Committee, contributed a paper dealing with "The Provision of Motor Vehicles Required on Mobilisation by the Chief Military Nations of the World." In the course of his remarks he said: The amount of transport which is required in peace is far less than that required in war, and in order to find work for the vehicles - should a Government decide to maintain and work its war establishment in peace—it would be necessary to compete with the carrying trade in the country. It is true that the postal services and other Government departmental duties would absorb a large number of vehicles, but there would still be a number of vehicles unemployed. The capital expenditure required for purchasing the requisite number of vehicles would not only be heavy but recurring, as the vehicles would have to be replaced, say, every three to five years, and a reference to the table appended to this paper will show the economy of a subsidy scheme, since instead of paying between £700 and £1,200 for a new vehicle each time it had to be replaced, a sum varying from £110 (Great Britian) to £450 (Germany) was paid instead, and there is no expenditure on the equipment, construction, and upkeep of large Government garages.

In Great Britain there are far more commercial vehicles of all types in operation than in any of the Continental countries. It would, therefore, be possible on the outbreak of war to requisition as many vehicles as are required, and Parliamentary power to do so has been obtained. The drawbacks to this arrangement are that it would take some time to get hold of the necessary number of vehicles, and it would not follow that they were maintained in a reasonably good condition with sufficient tools and spare parts. Also, great confusion would arise owing to difference of type, and there would be no interchangeability of even important parts as between one make and another. Of all the Continental countries named Great Britain lays down the greatest degree of standardisation, and insists on the nearest resemblance between one maker's productions and another. A certain amount of interchangeability as between make and make is insisted on in the specification for these subsidised vehicles, and some of the parts which are likely to be most frequently damaged, such as radiators, are interchangeable. With the sum of money which was provided for the subsidy, it did not appear possible to insist on a greater degree of interchangeability than has been laid down. It would, for instance, have been a great help if engines, gear boxes, and other parts could be interchangeable, as units between one vehicle and another. Such a standard would have necessitated the giving of a larger subsidy. With, however, such a large number of vehicles being used in the country of a type that would be fairly serviceable for military requirements, it was considered that the sum of £110 would be sufficient to enable the requisite number of vehicles to be obtained under the subsidy scheme.

MOTOR VEHICLES FOR MILITARY PURPOSES.

| Country. | Amount of Subsidy. | Number of Years Vehicles are Subsidised. | Useful Carrying Load of Vehicles. | Road Speed, Miles per Hour. | Types of Vehicles Subsidised. |
|---|---|---|---|---|---|
| | £ | | | | |
| Great Britain | 110 or 120 | 3 | 1½ tons or 3 tons... | Max. 16, Av. 12 | Lorries only |
| France ... | 300 (for a 3-ton lorry) | 4 | 2 tons and over... | Av. 9 | Lorries, lorries with trailers, and road trains |
| Germany | 450 | 5 | 4 tons on lorry, 2 tons on trailer | Max. 10 | Only lorries with trailers |
| Austria ... | 360 | 5 | 3 tons on lorry, 2 tons on trailer | Max. 10 Av. 6 | Do. |
| Italy ... | Vehicles owned by Government | — | 1½ tons & 2½ tons | — | Lorries only |
| Russsia ... | Do. | — | 1½ tons & 3 tons | — | Lorries |
| U.S.A. ... | — | — | 1½ tons ... ... | | Lorries |

## DESIGN FOR COLONIAL PURPOSES.

Capt. R. K. BAGNALL-WILD, R.E., contributed a paper on "Design of Commercial Vehicles for Colonial Purposes." No one design can fulfil all requirements; this question must therefore be considered under several headings. Primarily, the road conditions and even the existence of roads at all are of chief importance as affecting design. Then climatic influences must be met and the influence of altitude taken into account. Many cases exist where the transport has to be conducted over roads which vary from first class to mere tracks, and this appears to be the more usual Colonial problem to be faced. To meet it undoubtedly some difference must be made in design. Firstly, larger wheels are essential, also larger tyres, the former to give greater clearance between the axles, etc., and the ground and to give easier running. The latter are, of course, involved by using the bigger wheels, and secondly, are advisable on account of their much increased life on indifferent roads as compared with smaller tyres. Solid rubber tyres are essential for lorries, and the larger the better within reasonable limits. Economy in spite of increased capital outlay will result from the use of large tyres. In comparing quotations for vehicles special care should be taken to compare sizes of tyres. For rough work, the majority of manufacturers produce a special model, and a number of special features in design are sometimes added which are quite unnecessary. The main points are, big wheels and a frame and engine of size and scantling to carry 20 to 25 per cent. more load under English road conditions than is required to be transported under rougher circumstances. For instance, for a 3-ton useful load a lorry must be built to deal with four tons under English conditions. Variations of climate affect the circulating system, the carburation and lubrication. A departure from home standard is necessary to meet tropical or arctic conditions.

The leading manufacturers now have experience which enables them to fulfil any requirement. They can quote for any climate. Colonial

# MOTOR TRAFFIC.

inquiries are frequently accompanied by long detailed specifications, which involve special manufacture at a price beyond normal, and which more often than not are unnecessary. It is difficult at the end of a six weeks' post to answer and argue the various points embodied in these specifications. It is better for the intending purchaser to spend time and money in submitting lengthy and detailed descriptions of roads, gradients, climate, loads, labour, fuel, etc., and to ask manufacturers to quote to suit. A careful study of the replies should render a decision easy, and will effect a saving in capital outlay. The manufacturer can best say how to alter his standard design, and is in the best position to know the results he can obtain. There are sometimes conditions which require extensive alterations in design. In Ceylon, for instance, bridges, road width, and hairpin bends invite short, narrow vehicles, with a limit to total load and a large steering lock. A manufacturer will build anything at a reasonable cost if sufficient numbers are required, but the price becomes prohibitive for small numbers. There is one very important point that must not be overlooked, and that is gear ratios. There is obviously a difference between a London 'bus and a char-a-banc used by the Great North of Scotland Railway. In the one case, easy gradients and first-class street surfaces; in the other, very severe and lengthy hills with indifferent roads. For Colonial work a four-speed box is required, and, further, the difference between the first or bottom speed and the top should be a wide one. The War Office subsidy type includes a gear box, which is most suitable for Colonial work. Much can be said for and against the military types when considered from a commercial standpoint. In the first place, they are built for a special purpose, obviously not a commercial one, but many points embodied in the W.D. specification fit in with Colonial requirements; gear box, large wheels and tyres, large radiator, engine, and chassis generally are suitable for heavy work; in fact, the 3-ton W.D. type will carry four tons under normal English conditions. On the other hand, such general interchangeability is not so necessary in commercial work. Bonnet, foot pedals, engine control rods, axle arms, final drive, etc., have to be standard, of whatever manufacture the car may be. From the military point of view, such interchangeability of parts is an essential, but the W.D. have to deal with vehicles of varied manufacture, whereas the private owner can employ all of one type, and so obtain the desired result at less cost. The choice between steam and internal combustion engine resolves itself into a consideration of fuel, water, and speed conditions, and, provided the same are favourable, steam undoubtedly has many advantages for heavy haulage. When in quest of a suitable design for a given object, avoid non-standard unless ordering in quantities of 100 at a time; give manufacturers your wants with local information; ask their nearest experience; and from the replies received no difficulty should be experienced in selecting a suitable model.

## EMPIRE MILITARY TRANSPORT.

Mr. HORACE WYATT, editor of *Motor Traction*, read a paper "On the Means of Rendering Adequate Motor Transport Available for Military Purposes Throughout the Empire." His remarks enlarged upon the two following points:

(1) That the Mechanical Transport Committee should consult, whenever their programme touches on civilian requirements, with some body representative of users, manufacturers, and engineers throughout the empire.

(2) That the Indian, Dominion, and Colonial Governments and municipalities should be encouraged to assist in the development of an adequate supply of vehicles of types generally approved both for military and for civilian uses.

## MANUFACTURERS AND OVERSEA BUYERS.

"The Relations between British Manufacturers and Oversea Buyers," was the subject of the paper presented by Mr. G. HAMILTON-GRAPES, A.M.I.A.E., of Wellington, New Zealand. He said: I will endeavour to outline the reasons why commercial motor traction has not made the progress it should have done in the Oversea Dominions of the Empire, and at the same time to suggest what appears to me to be the remedy, in the hope that the discussion which may follow will lead toward concrete reformation. First and foremost stands the absence of trained professional advice. This, easily obtained in respect of English conditions, from consultants in London, is non-existant overseas. Up to the present, system in the relations of the principals interested has been non-existent, a prime factor in the many failures which have strewn the path of the young industry. Anyone has been deemed qualified to supply advice and a commercial motor vehicle to a buyer, who has generally been innocently ignorant of his own requirements. As illustrative, I will cite a few instances which have come under my observation lately. One was a motor omnibus designed for use on city streets at home, sent out to work in a practically semi-tropical climate, on a level dusty route. It was fitted with fixed glass sides and small wooden wheels, woefully under-tyred for the rough surfaced road. The springs also were equally unsuitable, having too great a set and being two short. What would have proved more applicable would have been opened louvred shutters for summer, 40-in. steel wheels, detachable twin solid-rubber tyres of 135 mm. section on rear wheels, and long springs built up of many thin leaves having little set. A worse case was one where a buyer imported a 29-seated char-a-banc of such long wheel base and low engine-power that the vehicle on its first trip could neither negotiate the corners nor the grades of the ordinary roads of the district. Result an immediate sacrifice at a considerable loss to its unfortunate owner. Another instance was a brewer's lorry, the design of which was unequal to the grades of the local streets. Sequel, a worm thrust ball-race gave way, and the machine was laid up for four months until complete spare parts arrived from England.

In my opinion a palliative to the above would be found in the more frequent visits of designers to oversea lands, where they could study the conditions governing this problem. Design must go hand in hand with actual practice on the spot. The next step should be the visit to the Dominions of commercial organisers, who could then ascertain for themselves the best channels for the distribution of the goods of the home manufacturer. The employment of the purely pleasure car importer, as he exists to-day, is criminally uneconomical. The point is often lost sight of that the oversea Britisher is a very keen buyer, and gone for ever is the day when anything was good enough for the colonist. While naturally preferring to deal with the motherland he often resents the uncompromising attitude adopted by some British manufacturers, which is tantamount to saying: "This is our standard specification of which we sell great numbers, take it, or leave." This want of knowledge of the requirements demanded by oversea conditions gravely approaches a national peril when viewed from the military standpoint, as a condition of success of any scheme prepared, or conditions laid down, by the War Office, must be co-ordination with design suitable for the whole of the Empire.

The key-note of the present War Office specifications appears to be rigidity and weight, whereas we people of the Dominions know that for our work we must have flexibility and lightness. Whippiness in a frame damps out all minor vibrations so insidiously destructive to the vital components of a chassis, whereas unbending stiffness courts and embraces the smallest. An acceptance of the accumulated *data*, based upon constant practice, now to be obtained from overseas, and the embodiment of such in British commercial vehicle design, would not make this vehicle one whit the less useful for purely home work—as greatly increased reliability and reduced running costs could be absolutely relied upon—but would make for the homogeneity of the military transport columns of any Dominion of the empire operating in any part of the world. For many years military exigencies must be met by the number of privately-owned commercial vehicles capable of fulfilling subsidy requirements, and now that the oversea trade is worth catering for, both demands should be met simultaneously. I advance for your consideration a few suggestions based upon my experience in Australasia for the past decade, in public service and commercial motor work, which may serve to show the trend or alteration of design necessary for the reduction of operative costs, and for a full measure of efficiency in motor vehicles, whether for commerce or for military purposes in our Empire overseas: Reduction of tare weight in relation to engine power; heavy spirit carburettors; three point suspension of power unit; light, large diameter steel wheels of strap suspension design; tyres of larger section in proportion to load carried; long, many-leaved springs; absolute dust-proofedness; governed engine and accelerator pedal for emergencies; accessibility; standardisation; minimum of unsprung weight; chain cases; single plate, or cone leather clutches; more powerful brakes, fitted with gilled radiators: strengthening of main frame side members by adjustable tension-rod trusses; increased wheel lock; front wheels to track with rear; subsidiary pneumatic shock-absorbers or cumulative springs; more ample cooling fitments; variable fan-speed; lateral windlass fitment.

## MOTOR TRANSPORT IN SOUTH AFRICA.

Mr. W. W. HOY (general manager of the South African Railways and Harbours) discoursed on "Motor Transport in South Africa, with Special Reference to the Organisation of Services Connected with the Railway Systems." In the course of a lengthy paper he said: The use of road motor transport is regarded as a system especially suited to South African conditions, and it is thought that the system should prove of great value for developing outlying districts sufficiently until the traffic offering justifies the construction of a line of railway. As

Digitized by Google

# MOTOR TRAFFIC.

regards the use of self-propelled vehicles for the delivery of goods at the larger towns where the roads are good, the conditions approximate very closely to those found in Great Britain and the Continent, and the railway department has for several years successfully used these vehicles in Johannesburg, where the fleet consists of 21 traction engines, tractors, and lorries. It is found that for general purposes the light tractor is the most suitable and the best revenue producer, as the engine is not compelled to remain idle while its cargo is being loaded or unloaded. Owing to the absence of large manufacturing houses, the solution of the lorry question by the use of detachable table tops, as used in Manchester and elsewhere, is hardly applicable to present conditions in South Africa, and this system is not expected to displace the tractor with the load carried on trailers. For luggage and parcels delivery the smaller lorries have been a great success, and the service has been much improved by the use of these vehicles. South Africa owes the development of its interior to its railways. The roads are, except in the older established districts and in the neighbourhood of the larger towns, mere tracks across the veld. In many cases, however, the veld affords really good road surfaces, but soft sand is frequently encountered, over which vehicular traffic is difficult. Unbridged rivers, spruits, and dry dongas present further obstacles, though rivers are usually fordable except during heavy rains. Isolated districts with vast capabilities, agricultural and mineral, are to-day lying fallow for want of means of transport, valuable deposits of salt lie untouched for the same reason, and workers find little reward for their labours, as they are unable to dispose of the results of their industry. In spite of the large sums spent annually in building new railways, it is impossible to provide communication to many districts which call for assistance in their struggle for development, nor can the country continue indefinitely to bear the costs of the deficits on developing railway lines.

Several privately-owned motor services are also in operation in South Africa. The Cape Town Tramway Company run a service of 20-seated 'buses to Hout Bay. The distance is about 30 miles, and the fare charged is 6s. The same type of vehicle is also employed to run a regular service between Cape Town and Cape Town Docks, a distance of approximately two miles, at a charge of 6d. per passenger. In Pretoria a motor 'bus service has been established, running between the town and the Country Club, while the Tramways Committee of the Johannesburg Municipality intend running motor 'buses to act as feeders to the tram lines in the same manner as the 'bus is intended to act as a feeder to the railway. At several small country stations considerable use is made of ordinary touring cars for carrying passengers between the stations and adjacent towns or villages.

### Hints to Manufacturers.

The services that would be most generally used could be placed under five heads: (1) Light station omnibus for private service; (2) 30—35-H.P. 'buses for passengers, mails, and parcels; (3) 2-3 ton lorries for fast goods traffic, luggage, and town deliveries; (4) light paraffin tractors for easy services on good roads; (5) heavy paraffin tractors for cross-country trains of trailers carrying 12 to 25 tons of goods. All the vehicles with which we have had experience and which have been of standard construction, as made by the British manufacturers, have so far answered the purpose satisfactorily, though running under conditions far more arduous than those for which they were designed.

If I may be permitted I should like to make one or two suggestions which might receive the attention of manufacturers who may contemplate the construction of vehicles designed to meet South African requirements. Speaking generally, I am of opinion that for cross-country goods traffic, powerful paraffin tractors, with large and wide wheels, will be most suitable. Working costs must be low in order that low rates can be charged for transport. In most cases speed is not a consideration, and in many instances the road conditions will not permit of fast running. In any case, rubber-tyred vehicles for heavy goods traffic cannot be regarded as a practical proposition, where transport has, in some cases, to be done at the rate of 4d. per ton per mile.

The following points are those I would like to put forward for consideration: (1) For passenger vehicles or other rubber-tyred machines, the desirability of using larger driving-wheels and tyres; the size suggested being 1010 mm. diameter and tyres 140 mm. wide. These should be of the detachable variety so that they can be reversed or changed quickly where hydraulic presses are not available. For goods lorries the fitting of spring wheels with steel treads for use on roads other than macadamised, for speeds up to 10 miles an hour, is also suggested. (2) The necessity of fitting efficient sprags to hold the vehicle on a hill. The usual trailing sprag is not satisfactory on soft ground. (3) The use of paraffin or alcohol as fuel. As regards the former, most satisfactory results have been obtained, and in some respects it is held superior to petrol, particularly in the case of big engines, where the absence of harsh running is noticeable when paraffin is being used. Indications of the occurrence of oil have been discovered in several parts of the Union, and development is taking place, but no oil is at present produced, so that for some time at least the present high cost of imported fuel will have to be reckoned with. An alternative is, however, at hand in the form of alcohol, which could be produced under Government supervision at a very low figure. The sugar cane industry in Natal could produce large quantities, while in other districts sweet potatoes, sugar beet, banana stalks, and maize could be profitably used for this purpose. (4) In crossing rivers it is important to have good magneto and carburettor clearance. It is also a wise precaution to "case-in" the lower half of the flywheel to prevent water being thrown about when crossing a stream. It is advisable to carry the final exhaust outlet as high as possible. If this gets under water the engine soon pulls up. (5) Some method of counteracting the dangers of skidding is badly wanted, and it would appear that this can best be effected by braking all four wheels on the diagonal braking system. (6) An efficient water-cooling system is a *sine qua non*. Radiators of the built-up type, in which leaky or damaged tubes can easily be replaced, are most serviceable. In districts where water is scarce and frosts occur at night, it would be advisable to arrange that only the water from the cylinders and radiator tubes need be drawn off. (7) As regards springing, the old-fashioned method of a centre bolt and spring clips is not satisfactory. The springs break at the centre bolt, and the axles get moved out of line over rough road. This part of industrial motors requires to be completely redesigned. The usual remedy adopted, by adding additional leaves, is not satisfactory. On passenger vehicles shock absorbers seem desirable. Dealing with the vexed question of worm, bevel, or chain drive, these have all given satisfactory results. The small unsprung weight of the chain system is a distinct advantage, but this is largely counteracted by the costly renewals of chains and sprockets. It would seem that independent gear drives, as used in the new Austin lorry and the Daimler-Lanchester petrol-electric back-axle, combine the advantages of the chain and worm and avoid the disadvantages. Except for the narrow coast belt, the altitude varies from 2,000 to 6,000 ft. above sea level. It is generally found that an extra air inlet, under control, has the effect of maintaining the efficiency and power of the engines.

The author also pointed out that there is a great need for rail cars, and that the right type of vehicle has yet to be evolved. Rail motor trolleys are extensively used.

## RESOLUTIONS ADOPTED.

Resolutions were carried recommending consultation between the Government, military authorities, users, and manufacturers throughout the Empire on the subject of mechanical transport subsidy, and that a permanent Imperial Motor Transport Committee, provided with subsidies from the Governments and chambers of commerce of the Empire, should organise visits of automobile designers to the oversea dominions to obtain the data requisite for improvements in self-propelled vehicles.

## PASSENGER TRANSPORT IN CITIES.

On July 26, Mr. W. Worby Beaumont, M.Inst.C.E., dealing with "Road Passenger Transport in Cities," said: Tramways continue to be of economic usefulness, more particularly in interurban communications and in special cases where a transport service of some kind is required, but where it is not of sufficient importance to encourage the district authorities to construct well-made high roads. Where, on the other hand, traffic for tramways is or is likely to be very heavy, then as most tramways are, like railways, fixed in their termini and stopping places, they have to be worked with the limitations and requirements of the railway properly so called, and so have ceased to be either economical or suited to the requirements of most of the great cities of the older countries, where many of the streets and principal highways are barely sufficient for the conduct of the general traffic by means of vehicles which can accommodate themselves to every varying requirement for the avoidance of congestion. In considering the requirements of road-passenger transport, it is always, in the first instance, to be remembered that the relative importance of public passenger transport and of the commercial and general traffic should be the first consideration.

There are many cities, chiefly those abroad, and of somewhat modern origin, wherein are broad streets and avenues laid out at right angles, where tramway services may be conducted in respect of a considerable part of the public-service vehicle requirement, without much—or in some cases even any—disadvantage to the commercial and general traffic; but even in such cities, if there be no tramways existing to-day, the advantages and facilities offered by dirigible vehicles of one kind or another would, in the opinion of many, make it doubtful policy to put down rails for a street railway system.

Digitized by Google

# MOTOR TRAFFIC.

In cities such as Oxford, for example, tramways would not only be an incongruity, but a waste of money. There are on the other hand large cities, such as Glasgow, where a great manufacturing population constitutes a large proportion of the whole, wherein the tramway passenger transport reaches a higher relative importance than in many other cities where the streets and roads are chiefly required for other classes of vehicles. The fact, however, that the tramways of any city are profitable as a business concern is not alone a proof that they are economically advantageous to the community.

It is unfortunate that in some cities, and especially in London, where a very large sum has been expended on tramway systems, and, public money having been employed, the best course to be taken now is somewhat difficult to foresee. London is perhaps an extreme case, but there are other cities or towns in which the tramways have become an incubus, either by the direct proof of continuous loss on the working, or by the indirect proof of loss to the community by obstruction and damage to other vehicles. In London, for example, the falling off of receipts, the great cost of permanent way maintenance and the traffic congestion they cause, have brought to the fore the question of what is to be done in the future, and the relative importance of tramway passenger transport and of all other transport will have to be taken into consideration. It has, however, become obvious that there should be no extension of the existing lines. The tramcar does not form 2 per cent. of the vehicular traffic of Greater London: and apart from the cost of its working it probably costs the community, by obstruction to the free passage of the general traffic and by losses and damage caused by the existence of the rails and the obstructions during repairs, far more than would a rate specially levied to cover interest and redemption of the whole of the capital that now stand as the tramway debt. The daily losses fall on the whole community indirectly as the result of the increased cost of commercial and general transit and goods carriage and delivery.

The trackless trolley system of omnibus has been adopted in a few places and is proposed in others. Where the overhead wire installation is already in existence and where those concerned are chiefly interested in the sale of electric current there may appear to be some reason for inquiring into this system, although there may be little reason for adopting it when the higher capital outlay necessary as compared with the ordinary independent vehicle is considered, and when the advantages of the entirely independent vehicle are taken into account, to say nothing of the great probability of mechanical and electrical engineering advances, which may render much that would be done to-day in the establishment of the trackless trolley system obsolete.

## MOTOR TRANSPORT FOR GOODS.

Mr. W. Tetley Stephenson (lecturer on railway transport at the London School of Economics) presented a paper on "The Organisation of Motor Transport for the Carriage of Goods, and its Value to the Mercantile Life of the Community." He said: At first sight it is a matter for surprise that the progress made by motor transport for goods has been so much less than that for passengers. The explanation seems to lie in the differences in the organisation of the two systems. Shopkeepers and traders in quite a small way of business will carry out their own delivery work, even though it require but one vehicle. To replace a single horse vehicle by a motor vehicle does not admit of economy. But it is not necessary to limit the case to one vehicle. A tradesman delivering in several districts in a town may have one vehicle for each district, and may find it just as difficult to effect any economy by a change. An essential change in the organisation must be made so as to arrange for adequate loads. Unless cost of motor transport can be reduced considerably, the loads which served for horse vehicles will not be profitable for motor vehicles. The big manufacturer and the large store may adopt the simple expedient of employing one motor vehicle in place of two or more horse vehicles, all covering the same ground. For businesses of smaller dimensions—and these are the more numerous—this is not possible. The total quantity of goods that each has for a given district is too small.

The solution must lie in combination. An excellent example of this is to be found at Malvern. There the hills are so steep that the individual trader found it too costly to deliver with his own carts all over the town. So the baker's cart delivers in one street, the grocer's in a second, the butcher's in a third, and so on. In fact, half-a-dozen tradesmen combine, and by parcelling out the town amongst them effect the whole delivery at not more than half of what the cost would be if each carried out his own work single-handed. At Malvern this arrangement was made in consequence of physical conditions. It is, however, just the type of arrangement necessary to meet the new conditions imposed by motor transport. I would contrast it with some records taken in a road some weeks back. The road contains 20 occupied private houses. Its length is about 500 yards. The first half has no houses, and the major half of the houses are in the last 100 yards. On the average eight large motor vans came down the road each day; only one called at more than one house. The consignments left as a rule were quite trifling. The whole of a day's consignments would only have occupied a small corner of one van, yet four van-miles were run at a cost of some 3s., where a half van-mile would have sufficed at a cost of perhaps 6d. In many cases the cost of the half van-mile in the road must have absorbed all the profit of the trader.

In the next place a motor vehicle must cover a large delivery area, and it is of moment that this larger area be arranged so as to give in the total the smallest number of van-miles. The arrangement of delivery areas must be studied not merely from the point of view of getting good loads, but also with the view of keeping the van mileage to a minimum. The working out of the areas so as to yield the greatest economy is a complicated problem, required more attention and skill than is at present devoted to it. If this is to be effected there must be combination on an extensive scale, not only amongst traders and manufacturers, but amongst the carrying agencies. Such combination has already begun. It is well known that over most of the country the railway companies have combined their cartage staffs. Around London some of the largest road carriers have entered into arrangements parcelling out various suburban areas amongst them.

Absence of handling of goods and rapid transit for the goods are advantages on which great stress must be laid. Motor transport undoubtedly reduces the percentage of breakages. There are, of course, limits to the usefulness and economy of motor transport for goods. At present for general merchandise the limit of distance is in the neighbourhood of 50 miles, and even then there is little chance of economy unless the bulk of the distance can be made a through run with practically a full load. For low-grade goods the limit in distance would be much less, but for explosives and goods subject to very high railway rates the limit is much higher. It is, however, in the delivery work near our large towns that the greatest benefit is to be obtained. It is only when motor vans generally displace the slow horse traffic that the streets will feel the full benefit of the change.

## MOTOR CAB PROBLEMS.

A paper by Mr. E. A. Greathead, managing director of the National Motor Cab Company, expressed a strong view in favour of the limitation of licences for motor cabs. The average number of miles run by a motor cab each day was 40 miles, which expressed five hours under motion. The driver was out of the yard about ten hours, and what he was doing in the remaining five hours was not known to the owners, and the cab did not show it. At present the cab business was not really a commercial business, because the chassis was standing idle too long. The more cabs the more idle mileage, and therefore they had a strong argument for the limitation of licences.

## BRITISH POSTAL MOTORS.

"The Use of Motor Transport by the Post Office within the British Islands" was dealt with by Mr. Walter G. Gates (assistant secretary to the Post Office). In concluding he said: It is perhaps impracticable to ascertain whether the use of motor transport by the Post Office for the conveyance of mails has resulted in an increase or a decrease in expenditure. Generally speaking, where there is a heavy load and where the distance to be travelled is considerable, motor traction is not only more efficient but more economical than horse traction. But where the load is light and where there are long intervals between journeys, there is difficulty in arranging any economical method of motor traction, especially if the distance to be travelled is at all short. £138,821 per year is now being paid for the conveyance of mails by motor vehicles, and this sum is about 20 per cent. of the total expenditure for the conveyance of mails by road within the British Islands. The following figures may prove of interest:

Conveyance of Mails by Road.

Vehicles appropriated to mails only:

## POSTAL MOTOR SERVICES.

Mr. G. HAMILTON-GRAPES (delegate representing the Postmaster-General of the Dominion of New Zealand) gave a brief survey of the present conditions of the various self-propelled vehicle services installed for postal work as he found them during his recent inspection for the Government of New Zealand of the motor postal services in New South Wales, Victoria, Tasmania, South Australia, Western Australia, Italy, Austria, Hungary, Germany, France, and Great Britain. He concluded: I am compelled to admit that progress has not been made in this branch of public service motor work commensurate with the improvement that has taken place in the purely civilian commercial sphere of the movement during the past few years. These services may be taken as a whole as unsatisfactory from a financial standpoint to the actual operators. From the aspect of greater efficiency in actual handling of mail matter they are an unqualified success. The same factors that govern the problem of all-round success in other spheres of commercial motor work demand attention equally in postal affairs. It is solely due to their non-recognition by the interested principals that so much mechanical trouble has been and is experienced. I have found in all countries since my first inspection for the New Zealand Government in 1908, the same costly experiments being repeated again and again. Each State ignores past experiences and mistakes made by others which have tried out the transportation of mail matter by motor vehicle.

The British of the Empire are as much at fault here as other nations. This is deplorable, as the utilisation of the motor vehicle for postal work is comparatively in its infancy, and a vast field awaits the advent of a suitable light four-wheeled machine for the collection of letters from the pillar boxes, handling express parcel post and registered mail matter. The search for this machine has been the objective of my recent tour. There should be no insurmountable difficulty in solving this problem, and in my opinion it can best be met by following out in miniature the lines of the tried-out taxi-cab chassis. An outline specification of such a machine would involve a four-cylinder water-cooled engine, furnishing 10-H.P. at 1,000 revolutions per minute, the total weight complete not to exceed 75 lb. per brake-horse-power. The Hungarian postal authorities have solved this question, and placed an order for 200 machines. The Governments of Italy, Austria, and France are now engaged in searching for similar machines designed and manufactured in their own countries. The remedy for the evils which exist to-day would, in my opinion, be found to consist in giving effect to the following conditions: All contract work to be for terms of not longer than five years; all State-owned fleets to be controlled by qualified motor experts; the fitment of lighter bodies; reduction of speed in the heavy vehicle class; larger wheels for all work except severe gradients; heavier sectioned tyres; discontinuance of the present practice of overloading; one man, one machine, which would also embrace ample vehicle reserve, and full time for inspection and timely repairs.

## THE RECORDS OF A MUNICIPAL MOTOR OMNIBUS UNDERTAKING.

Mr. P. ELLISON (general manager and engineer of the County Borough of Eastbourne Motor Omnibus Department), in a paper bearing the above title, said, in connection with the motor omnibus movement, Eastbourne claims considerable distinction, inasmuch as its public passenger transport is handled solely by motor omnibuses. The population when the motor 'buses were started in 1903 was about 40,000, and it is now about 52,000. Motor 'buses were adopted because it was felt that they would not affect the beauties of the town as would a tramway service. The hopes which were entertained when motor omnibuses were adopted have been fully realised. The class both of visitor and resident has been fully maintained. The road surfaces are as good as ever they were; local feeling is appreciative of the omnibuses; the lucrative summer season has increased in length, and the winter season is growing in importance. Moreover, it has been found possible to provide services which work at a profit without very heavy capital outlay, and without charging unduly high fares.

The department was formed in 1902, four vehicles being operated. Two more were added in 1903, two in 1904, two in 1905, four in 1906, four in 1907, three in 1908, nine in 1910, and two in 1912. Of these, 12 have been Milnes-Daimler vehicles, 16 De Dions (of which 12 were purchased second-hand), two of the old type of Clarkson steam omnibus, and two—the most recent purchases—the modern type of Leyland omnibus. Some of the earliest units of the fleet dropped out of action in a few years, but out of the first four Milnes-Daimlers two are now working for the highways department, while two more are being converted into water carts. There are 20 omnibuses in regular service. A year after the department was formed three routes were operated by six vehicles and about 12 men. In 1913 eight routes are operated by 20 vehicles, and the number of men amounts to 82. Repairs are carried out in the department's own works. The majority of the vehicles when not on the road are accommodated in a depot constructed comparatively recently.

Attached to this paper I have set out the costs of operating the vehicles from 1905, when full records were first made available, until the end of March of this year. The number of passengers carried increased regularly from 1905 until 1912, but the last financial year showed a drop in the number, due to the bad weather in the summer of 1912. The financial results have been of late very satisfactory. There were losses amounting in 1905 to about £295, in 1906 about £318, and in 1907 about £252. It was near the end of 1906 that the writer took over the management. Since that date profit has been shown on the working for each year. For 1908 the net profit was £50. The next year saw a drop of £250, but in 1910 there was a satisfactory balance of £660. In 1908 three second-hand 'buses were purchased, and in 1910 no less than nine second-hand vehicles were bought at a cost of little over £200 apiece. Many of these cars required expensive overhauls before they became satisfactory units of the fleet, and it also became advisable at about the same time to make somewhat extensive alterations in the transmission of some of the older cars. In view of these considerable expenses for 1911, the figure of net profit fell to about £41, and for 1912 was only about £105. By the beginning of the last financial year most of this expensive work had been completed, and the result for the twelve months terminating at the end of last March was a net profit of £711, the highest yet obtained in any one year's work. This year also indicated the increasing popularity of the omnibuses, by a rise in the receipts per mile run.

In judging the results obtained by the figures of cost per mile, due regard should be had to the fact that winter services are operated at a loss in the interests of the permanent residents. Also, the summer trade is very greatly in excess of the winter trade, on account mainly of the large number of visitors. This means that the number of 'buses required for the summer is much in excess of the number that can be kept regularly in employment during the winter.

### ECONOMY OF WORKING WITH MODERN VEHICLES.

The figures of cost appear to show an upward tendency since 1905. At that time the vehicles were comparatively new, whereas now, all, with the exception of two, are of old design, and have covered a very considerable mileage since they were first put upon the road. In the opinion of the writer the allowance made for depreciation in the early days was insufficient, and a substantial increase in this allowance caused an apparent rise in the figures of cost from 1907 onwards. The introduction of a number of second-hand vehicles also tended to put the figures up. Were the department operated by a company, the amount charged for interest and repayment of loans would be available for dividend. Of late considerable sums have been spent on the purchase of additional vehicles out of revenue. The loans negotiated for the purchase of 'buses have been repaid, with the exception of about £4,000; the sum owing upon buildings amounts to about £6,000. Consequently, it may be said that the capital at present involved is some £10,000, so that it will be seen that the net profit of the past year, after interest has been paid on capital at the rate of about 4 per cent., would indicate substantial dividends for a company.

If the whole of the fleet were comparable with the two new vehicles added during the last 12 months, the total cost of operation, including all charges, would approximate to 10d. per car-mile. Separate accounts have been kept for the new cars, which have covered some 14,000 miles each, and it is found that petrol, wages, cleaning, maintenance, lubricants, stores, and spare parts, work out at about 3·75d. per mile. The suggested figure of 10d., inclusive of interest and repayment of loans, would no doubt rise slightly as the 'buses grew older and renewals became necessary. It would, however, never approximate to the present cost. To take one example only to illustrate this point, it may be mentioned that the renewal of wearing parts in the final drive of one of the older vehicles involves an expenditure of £15 every three months. A reliable estimate for corresponding parts of the cars of more recent design puts the cost at £16, these parts lasting more than 12 months, so that this item alone shows a saving of approximately £50 per car per year, which saving would continue throughout the life of the vehicles. At the present

Digitized by Google

# MOTOR TRAFFIC.

moment, the estimated value of the fleet is considerably in excess of the loan outstanding, and the department is reported by the borough accountant to be in a very strong position.

Attention should be called to the anomaly that the department makes a considerable annual payment, through the medium of the petrol tax, to the funds of the Road Board, these funds being employed for road improvement throughout the British Isles. It seems unreasonable that a national contribution should be made in connection with work that is purely in the nature of local service. The services have been maintained with a satisfactory degree of safety to the passengers, and also to other users of the roads.

## THE COMMITTEE TO REMAIN IN OFFICE.

In the general discussion Mr. J. W. DUGDALE (Oldham Corporation tramways manager) criticised Mr. Ellison's figures.

Mr. R. DUNCAN (South Australia) said he would be asked on his return whether the tests in different countries were similar and held under similar conditions. Before he came to England he considered that, in Australia, they had good and bad roads; now he considered they had bad roads and worse. The sand out there is awful, and vehicles are overloaded.

Sir JOHN H. A. MACDONALD (Scottish Automobile Club) said he was glad to hear how good our roads were. The question of good roads should be taken up universally, as thereby the cost of running motor vehicles would be lowered. With smooth roads tram rails were not wanted on top of them. The day of the tramway, he thought, was over, and that no more of them would be laid down in large towns.

Colonel R. E. CROMPTON said that the streets of London were safer now than at any other time owing to the education of 30,000 drivers by the Commercial Motor Union. The pedestrian showed the least consideration of all. Children should be educated how best to avoid road traffic.

A delegate from British Columbia suggested that co-operation would do away with some of the trouble at present attending road transport.

Mr. F. CHURCHILL (J. and E. Hall, Limited) said that chain drive was best for rough work, while the speed could be more easily varied. The War Office having refused chain drives, the Colonies will follow suit to their disadvantage. The whole of the remainder of the War Office "subsidy" specification could be followed with the chain drive, and it should, therefore, be moved to modify this rule.

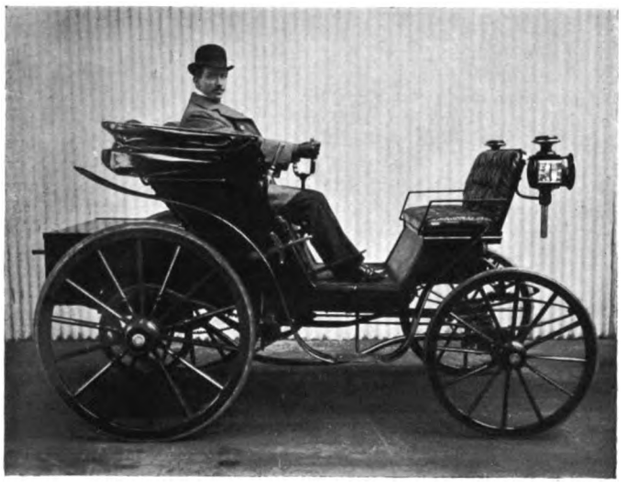
Colonel CROMPTON considered this a most important point, and suggested an adjourned discussion.

On the motion of Mr. H. G. HUNTLEY (South Africa), it was decided to ask the Executive Committee to remain in being with a view to their adopting a permanent constitution, linked up with the Dominions.

During the week visits were paid to Brooklands automobile racing track, the London Aerodrome at Hendon, and Windsor Castle. For the latter visit the London General Omnibus Company placed 24 omnibuses at the disposal of the party. The trip through many picturesque portions of the Thames Valley gave a good idea of the efficiency of the motor omnibus as a means of conveyance into the country for town dwellers. On another occasion the London General Omnibus Company conveyed the delegates for an inspection of London traffic and of Willesden Green garage, one of the 34 establishments of the kind owned by the company. Statistics were shown which proved that the amount of mileage lost on an average by one motor 'bus in a month is from 3 to 3½ miles, this including anything unforeseen which keeps the vehicle at a standstill. On July 25 Thomas Tilling, Limited, supplied a number of their petrol-electric omnibuses, and conveyed the visitors to the General Motor Cab Company's garage, and the mail van depot of Thomas Tilling, Limited.

## MR. SIDNEY STRAKER.

Mr. Sidney Straker, whose portrait appears on page 142, is the present chairman of the Commercial Vehicle Committee, and to him was due in a large measure the success of the Motor Vehicle Exhibition at Olympia, the arrangements for which were in the hands of the committee. Mr. Straker is one of the pioneers of the motor industry. He designed and built his first motor car in 1897 (the accompanying illustration is reproduced from a photograph taken in June of that year), and from that time onward he has been a moving spirit in the trade, and has worked vigorously and successfully in the interest of the whole industry. He was one of the founders of the Royal Automobile Club, and for many years a member of its committee of management. Mr. Straker was early identified with the policy which had for its object



**Straker Motor Car Built in 1897.**

the popularisation of the motor car, and in conjunction with the Hon. Arthur Stanley was mainly responsible for the inauguration of the series of annual exhibitions at Olympia which not only placed the society in a sound financial position, thereby enabling it to undertake a number of onerous duties for the general welfare of its members, but created a demand for motor cars which has developed with such remarkable rapidity. Mr. Straker was largely instrumental in bringing the R.A.C. and the S.M. & T.A. together in order that the full benefit of the exhibition policy should be enjoyed by the manufacturers.

Mr. Straker was president of the Society of Manufacturers and Traders for three years in succession, viz., 1904-5, 1905-6, 1906-7. He is an associate member of the Institution of Civil Engineers, and a member of the Institution of Mechanical Engineers.

## KEIGHLEY OMNIBUS RESULTS.

In presenting the accounts of the tramway and motor 'bus undertakings for the year ended March 31, Councillor A. Smith, on July 22, stated that there was a decrease in revenue of £742 owing to the bad summer and the giving of cheaper facilities—2½ miles for a penny. The gross profit on the tramways was £9,158. Better results had been achieved this year in the motor omnibus department, the working expenses having been met and a slight balance remaining towards interest and sinking fund. The result had, he thought, proved that the committee were wise not to discontinue the service entirely, as the tramways would lose the traffic for the cars which was now induced by the 'buses. The cost per mile worked out at 1s. 4d., while the income was slightly under 1s. 0½d. Last year £1,103 was transferred to the loss on the 'buses from the net profit of the tramways, but this year only £368 had been transferred, so that the actual improvement on the working of the 'buses equalled £1,133.

Digitized by Google

# MOTOR TRAFFIC.

The experimental railless trolley cars which had been running since May 3 last had created a favourable impression. From that date to July 14 the car had covered 2,126 miles, and the revenue equalled 12·54d. per mile—a slightly better revenue than that received on the 'buses during the past twelve months' working. The operating costs were well within the estimate given, and the wear on the tyres would be only one-fourth of the wear on the omnibus tyres.

## MOTOR TRAFFIC NOTES.

Brighton, Hove, and Preston Omnibus Company.—The board have declared an interim dividend of 3¾ per cent. (3s. per share), free of income tax, on the ordinary shares for the half-year.

Nu eaton's Transit Requirements.—The Nuneaton Co-operative Society have urged upon the Town Council the necessity for providing a tramway or motor 'bus service for the town and district.

Competition and Halfpenny Fares.—The short halfpenny stages on the Hackney and Clapton routes of the London County Council Tramways have been extended to correspond with those given on the omnibuses.

Electric Vehicles for Postal Service.—In Vienna 30 electric vans have been placed in service on 15 postal parcel delivery routes. It is estimated that during the year the vans will cover 496,000 km., making 182,000 journeys.

A Petrol Tramcar for Stirling.—Subject to the consent of the local authorities being given, the Board of Trade have authorised the use, as an experiment, of a petrol-propelled tramcar on the system of the Stirling and Bridge of Allan Tramways Company.

Dry Seat Problem on Omnibuses.—The London General Omnibus Company, Limited, are asking for suggestions for making the tops of the omnibuses comfortable and pleasant to travel on under any weather conditions. A roof is impossible, and the present arrangement of mackintosh aprons is quite unsatisfactory.

Opening for a Motor Service in Wales.—It was suggested, at a meeting held at Bridgend to consider the inadequate train service of the Great Western Railway between Bridgend and the Llynfi, Ogmore, and Garw Valleys and Kenfig Hill, that a motor road service should be established between Bridgend and Kenfig Hill.

All-night Omnibuses in London.—The London General Omnibus Company on July 14 instituted an all-night service between Cricklewood, N.W., and Liverpool Street, touching the principal points of night business and traffic in the metropolis. That the facility is required, has been proved by the patronage received, while requests for similar services have been received from other districts.

A Matter for Omnibus Companies.—At an inquiry held on July 10 into the death of a tramway employee who was killed by a motor omnibus at Streatham while passing between that vehicle, a tramcar, and a cyclist, the jury returned a verdict of accidental death, and added the rider: "We desire to add that the practice of motor 'bus drivers selecting the same stopping places as the tramcars is a source of public danger, and in our opinion was the chief cause of this fatal accident."

Steam Omnibus for Liverpool Juries.—Liverpool Corporation Tramways have obtained from the National Steam Car Company, Limited, of Moulsham Works, Chelmsford, a steam chassis of the maker's standard 32-h.p. type. Leaving London at 5 a.m. on July 23, the chassis travelled to Liverpool under its own steam, arriving at 7 p.m., after covering a distance of 210 miles. Mr. Clarkson accompanied the chassis. An omnibus body will be erected on this chassis at the Lambeth Road car works of the Liverpool Corporation, and the vehicle is to be used for the accommodation of the city coroner's juries.

Southend and Omnibuses.—Report was made to the July meeting of the Council that arrangements had been made for the proposed purchase of omnibuses by the Corporation to be cancelled, and that in respect of such cancellation the Corporation should pay Messrs. Stevens and Company £100 in discharge. The town clerk reported that at the direction of the chairman of the Tramways Committee he had acknowledged Messrs. Stevens' courtesy in dealing with the matter, and to state that their firm would have favourable consideration in case the Corporation required omnibuses in the future, although the Corporation must necessarily in such case be quite free to go into the market. The Council approved of the action of the committee.

Popularity of Omnibuses in Croydon.—Commenting upon the debate on the Tramways Committee's annual report for the past year, during which period motor omnibus competition was inaugurated, the *Croydon Guardian* says: "If the public could only be prevailed upon to use the tramcars in preference to the 'buses, where both are in competition, the tramways chairman's optimism would probably prove to be well founded. But the way in which the public flock to the 'buses after repeated counsel to the contrary would seem to show they are for nothing so much as the making of a whip to be used upon their own backs." The same journal observes that the tramway facilities for which the South Norwood and Addiscombe Ratepayers' Associations asked are now being supplied by the 'buses.

Paraffin as Motor Fuel.—A demonstration of the Southey oil gas producer was recently given at the works of Commercial Cars, Limited, at Luton. Hitherto attempts to use paraffin as a motor fuel have been in the form of vaporisers which either entail the use of high-grade oil or the separate use of petrol for the purpose of starting the engine. The Southey oil gas producer is not a vaporiser and requires no petrol even for starting from the cold, it can be fitted to any type of internal combustion engine without any alteration to any part of the engine, and the engine can be started up in exactly the same manner as when running on petrol. Moreover, the cheapest grade of oil can be used and the consumption is no higher than that of petrol costing from two to three times the price. The demonstration was a complete success.

Motor Tyre Litigation.—At the West Riding Assizes on July 15 J. W. and T. Connolly, Limited, tyre manufacturers, London, sued Henry W. Heaps, motor carrier, of Darwen, for money alleged to be due under an agreement for the hire of motor tyres. Mr. Justice Rowlatt decided that there was no answer to the action. Defendant hired the tyres by agreement, one of the terms of which was that plaintiffs might turn him into a purchaser at 25 per cent. discount if he broke any clause of the agreement. One of the things he undertook to do—it was a severe burden—was to make absolutely accurate returns, and to do that he ought to have provided himself with a mileometer. He did make erroneous returns, and he must, therefore, accept the consequences of the agreement. There would be judgment for the amount claimed, £192.

Railless Traction and Road Repair.—At a meeting of the West Riding of Yorkshire County Council on July 9, Ald. Crossley, in moving the report of the Law and Parliamentary Committee, commented upon the decision of the committee to oppose the Mexborough and Swinton Railless Traction Bill. He remarked that the position with regard to the upkeep of main roads was most unsatisfactory. An estimated cost of £2,500 a mile would have to be incurred for putting the road into such a state as would fit it to carry the extra traffic. It seemed unreasonable to call upon a community to go to such expense. They had also to ascertain what should be paid for damage done in the ordinary way by trolley vehicles. The greatest sum had been one halfpenny per car-mile, but three-eighths of a penny was the sum generally accepted. That was unreasonable, and was much under the actual cost of the damage done.

Competition in Oldham.—The Tramways Committee have discussed the question of carrying passengers on the initial and last journeys of the motor omnibuses from the depot to Moorside and back. It was proposed to allow the public to travel for a sixpenny fare, but several members contended that the 'buses would not secure passengers at that fare, and the chairman stated that the committee did not want to rob the tramway service. The manager explained that people paid 2d., 3d., and 4d. to ride in wagonettes from Moorside to Grains Bar and that while the motor 'buses were running. If the committee charged the ordinary car fare people would hang back for the motors, and the cars would be running empty, because there was no scheduled time for starting. The committee decided to charge 3d. and 6d. fares. The committee decided to purchase a third omnibus, which is to be fitted with the latest type of mud-guard, coming low down, to prevent splashing.

Petrol-Electric Motor Fire Appliances for London.—The Fire Brigade Committee of the London County Council on July 22 reported to the Council they were advised that petrol-electric motor appliances suitable for the purposes of the Fire Brigade could not be obtained in this country, and they recommended the acceptance of the following offers for additional appliances of that kind: Magirus, Ewald, und Lieb, of Ulm, to supply two Magirus ladders, to fit the ladders to Braun chassis, and to deliver the complete appliances in London for the sum of £1,300, including extras; J. C. Braun, Premier Werke, A.-G., Nürnberg, to supply at the works of Magirus, Ewald, und Lieb two petrol-electric chassis for fitting to Magirus ladders for the sum of £2,222; J. C. Braun, to construct and deliver in London a petrol-electric chassis for an escape van for the sum of £930. The work of completing the escape is proposed to be carried out at a cost of £150 by the Fire Brigade Committee.—On July 29 the Council agreed to the recommendation with the addition that the contractors be required to sign a fair wages clause, and that the carrying out of such condition be insisted on by the Council.

## WEEKLY LIST OF TENDERS INVITED.

### COUNTY BOROUGH OF BLACKPOOL.

TRAMWAYS DEPARTMENT.

WATERPROOF CLOTHING.

Tenders are invited for the supply and delivery of Waterproof Clothing required for Traffic Staff for the ensuing two years. Form of tender may be obtained on application to the undersigned.

Tenders, in sealed envelopes, endorsed "Waterproof Clothing," addressed to the Chairman of the Tramways and Electricity Committee, Electricity Works, West Caroline Street, Blackpool, and to be received not later than Wednesday, August 20, 1913.

The Corporation do not bind themselves to accept the lowest or any tender.

CHARLES FURNESS,
Borough Electrical Engineer
and Tramways General Manager.

General Offices, West Caroline Street, Blackpool,
August 7, 1913.

### EAST INDIAN RAILWAY.

The East Indian Railway Company is prepared to receive tenders for the supply and delivery of:—

(1) Brass and Copper Tubes.
(2) Leather Belting, Butts, etc.
(3) Galvanised Straining Bolts and Strand Wire for Fencing.
(4) Red and White Lead.
(5) Bolts, Nuts, Rivets, etc.
(6) Copper Ingots,

as per specification to be seen at the Company's Offices.

Tenders are to be sent to the undersigned, marked "Tender for Brass, etc., Tubes," or as the case may be, not later than 11 o'clock a.m. on Wednesday, the 27th day of August instant.

The Company reserves to itself the right to divide the order, also to decline any tender without assigning a reason, and does not bind itself to accept the lowest or any tender.

For each specification a fee of £1 1s. is charged, which cannot under any circumstances be returned.

By order, C. W. YOUNG,
Secretary.

Nicholas Lane, London, E.C.,
August 14, 1913.

### H.H. THE NIZAM'S GUARANTEED STATE RAILWAY COMPANY, LTD.

The Directors of H.H. the Nizam's Guaranteed State Railways Company, Limited, are prepared to receive tenders for the supply of Steel Material (Flats, Sheets, Rounds, etc.).

Tenders should be addressed to the undersigned, and delivered on Friday, August 22, 1913, marked "Tender for Steel Material."

Specifications are obtainable at the Company's Offices on payment of ten shillings each.

The Company is not bound to accept the lowest or any tender.

By order, M. T. WALKER,
Secretary.

Company's Offices, Winchester House,
Old Broad Street, London, E.C.,
August 13, 1913.

### CITY OF DUBLIN.

ELECTRICITY SUPPLY.

The Electricity Supply Committee of the Corporation of the City of Dublin are prepared to receive tenders for the supply of the following:—

Alternating Current Meters, Single Phase.
" " " Three Phase.

for a period of two years.

Specification, with terms and conditions and form of tender, may be inspected at the office of the City Electrical Engineer, Fleet Street, Dublin, on and after August 8, 1913, and may be obtained from the latter on payment of £1 1s. od., which sum will be refunded on the return of the specification, filled up, with a *bona fide* tender.

Tenders (sealed and marked "Tender for Electricity Meters") must be addressed to "The Chairman, Electricity Supply Committee, 3, Cork Hill, Dublin," and be delivered not later than 12 o'clock noon on August 26, 1913.

Each tender must contain the names of two sureties who will be prepared to execute a joint and several bond for the due performance of the contract in a sum of 20 per cent. of the contract price.

The Committee do not bind themselves to accept the lowest or any tender, and the contract will be subject to ratification by the Municipal Council.

FRED J. ALLAN,
Secretary.

Electricity Supply Committee's Offices,
Cork Hill, Dublin, August, 1913.

### COUNTY BOROUGH OF ROTHERHAM.

MOTOR FIRE ENGINE.

The Watch and Fire Brigade Committee of the Rotherham Corporation invite tenders for the supply of a 400-gallon Turbine Motor Fire Engine of 60 h.p., with 40ft. Extension Ladder.

Persons or firms tendering must furnish with their tender full specification, drawings, and detailed particulars with respect to the engine proposed to be supplied by them. The firm whose tender is accepted will be required to enter into a contract which will contain the Fair Contracts Clause.

Tenders, endorsed "Motor Fire Engine," to be sent to me not later than the 1st September next.

The Corporation do not bind themselves to accept the lowest or any tender.

CHAS. L. DES FORGES,
Town Clerk.

Town Hall, Rotherham,
August 13, 1913.

## POSITIONS VACANT.

### MALVERN URBAN DISTRICT COUNCIL.

GAS MANAGER AND ELECTRICAL ENGINEER.

The above Council invite applications for the position of Gas Manager and Electrical Engineer.

The person appointed will be required to devote his whole time to the duties of the office, and to carry out such duties as shall from time to time be assigned to him.

The salary will be at the rate of £350 per annum, rising to £400.

Applications, endorsed "Gas Manager and Electrical Engineer," must reach the Chairman of the Council, Council Offices, Malvern, not later than Saturday, August 30, 1913.

Forms of application may be obtained from the undersigned.

Any candidate is at liberty to forward me 20 copies of his application and three recent testimonials (but of nothing else whatever) in stamped envelopes for transmission to the members of the Council.

Canvassing in any form whatever will be a disqualification. This rule will be strictly adhered to.

Dated this 2nd day of August, 1913.

H. L. WHATLEY,
Clerk to the Council.

Council Offices, Malvern.

Digitized by Google

### MUNICIPALITY OF SOMERSET WEST, STRAND, SOUTH AFRICA.

ENGINEER WANTED.

Applications are invited for the position of Engineer to the Council.

Applicants must also be fully qualified and competent to make the necessary surveys and estimates, draw plans and generally supervise and carry out a drainage scheme for the municipality. Applicants to state inclusive salary expected, and earliest date upon which duties could be commenced. Applications, with testimonials and past experience, addressed to the Town Clerk, Somerset Strand, Cape Province, Union of South Africa, to be in not later than September 17 next. Applicants may also communicate with H. A. Fagan, 25, St. George's Square, London, N.W.

### WALSALL CORPORATION TRAMWAYS.

CHIEF CLERK.

Applications are invited for the above position. Candidates must be experienced in book-keeping and accountancy, and have a good knowledge of a tramway ticket system.

Salary £130 per annum, rising by annual increments of £10 to £160.

Applications, stating experience and qualifications with copies of testimonials, must be sent in not later than Saturday, the 30th inst., and addressed to the undersigned.

R. L. Horsfield,
General Manager.

Birchills Depôt, Walsall,
August 13, 1913.

### STATISTICAL CLERK.

Statistical Clerk required at once. Must have sound mathematical knowledge and ability to apply same in practice. Preference given to men accustomed to the routine of schedules, preparation in connection with the working of trains, trams, etc. Write, giving full particulars, etc., to Box 4179, Willings, 125, Strand, W.C.

### MUNICIPAL TRAMWAYS ASSOCIATION.

ANNUAL CONFERENCE.

The Annual Conference of the Municipal Tramways Association will be held at Sheffield on Wednesday, September 24, Thursday, 25, and Friday, 26.

### WANTED.

Copies of The Tramway and Railway World for September, 1906, October, 1907, and October, 1908. Apply to the Publishers, Amberley House, Norfolk Street, Strand, London, W.C.

## THE MOTOR TRAFFIC REPORT.

In this issue we publish an abstract of the report of the Select Committee of the House of Commons on motor traffic in London. The subject is of interest to those concerned in traffic problems in all large centres of population in the country, though the troubles in the metropolitan area differ both in degree and in kind from those encountered elsewhere. It is true that the report of the Committee bears traces of haste in preparation; it had to be issued by the end of the session, and publication was achieved only on Thursday, while the session closed yesterday. All the same, the report is of great value in two aspects. One of these is the great amount of traffic information which it contains, including statistics as to accidents, and the other is the valuable nature of many of the recommendations. The need for such an inquiry may be judged from the fact, apart from anything else, that the number of street accidents has increased more than threefold in eight years, and that the motor omnibus record in accidents is most unsatisfactory. Among the recommendations to which whole-hearted assent may be given are that one Government Department only (instead of three as at present) should advise Parliament on London traffic, that the borough councils' veto on new tramway schemes should be abolished, and that closer control of traffic should be exercised by the police. But the blot on the whole report is the recommendation that the county councils in the metropolitan police area should formulate by-laws for regulating traffic, subject to an appeal to a new traffic branch of the Board of Trade, which is to be the Department advising Parliament. If the county councils had confined themselves to their administrative work, they would no doubt have been admirable bodies for making traffic by-laws and regulating and defining omnibus routes. But the two most important county councils concerned, those of London and Middlesex, are in the business as owners of tramways. Even with the power of appeal, great trouble would arise when the county councils began to dictate to the omnibus companies, for such an arrangement would always tend to help the tramways and prejudice the omnibuses. Omnibus traffic has bad features, but at present it is indispensable in districts where there are no tramways. The omnibus companies have an issued capital of nearly five millions, and their interests should be protected. It may be well that there should be a restriction of omnibus working along tramway routes, but the body to impose the restriction should not be the body owning the tramways. No solution of the case is satisfactory over all, except the old one proposed eight years ago by the Royal Commission on London Traffic—namely, the creation of a Traffic Board for London. A powerful, impartial expert body is required to look after all phases of London traffic, and to devise new schemes to meet growing needs.

## LONDON TRAFFIC REGULATION.

### REPORT OF THE SELECT COMMITTEE.

The report of the Select Committee, which was originally appointed by the Government on November 27, 1912, was issued on Thursday. Their principal recommendation is that a new Traffic Branch of the Board of Trade be set up as a Traffic Board to advise Parliament in all Metropolitan traffic matters.

**RECOMMENDATIONS.**

The Committee's own summary of its proposals is given in full below:—

(1) That in all Metropolitan traffic matters Parliament should be advised by one Department, which should combine the traffic duties of the Home Office, the Local Government Board, and the Board of Trade, including the confirming of by-laws.
(2) That a new Traffic Branch of the Board of Trade be set up to perform the above and other duties.
(3) That the veto of Borough Councils in regard to Tramway schemes be replaced by a full hearing before the new Traffic Branch, which shall report to Parliament. That Standing Order 22 be revised.
(4) That County Councils in the Metropolitan area should have the widest possible by-law-making powers, subject to confirmation by the new Traffic Branch of the Board of Trade.
(5) That all mechanical stage carriages and hackney carriages be brought under closer control; that the routes, time-tables, and number of stage carriages be subject to County Council Regulations confirmed by the new Traffic Branch of the Board of Trade, with a right to local authorities and other interested parties to be heard, such right to extend to any decision of a Council relating to these matters, or the refusal or neglect of any Council to take action when requested to do so; that the design of mechanical stage carriages be subject to the new Traffic Branch, which should have independent expert advice.
(6) That the licensing of stage carriages and hackney carriages be a duty of County Councils and County Borough Councils, subject to a right of appeal to the new Traffic Branch.
(7) That special speed limits for motor omnibuses and other heavy motor traffic be imposed where conditions are especially dangerous.
(8) That closer control of traffic be exercised by the police.
(9) That traffic points be fixed at a greater number of crossings.
(10) That more refuges be provided.
(11) That so soon as practicable means be taken to remove the congestion caused by dead ends of tramways, street markets, and roadway obstructions.
(12) That the measures already taken through the schools to warn children and parents as to street dangers should be continued and extended.
(13) That suggestions as to amendments of the law and other matters mentioned in the report be carried into effect.

The report, which is of much interest, is issued in the form of a "White Paper," and covers 42 pages, of which we can give only a brief summary:—

**POINTS FROM THE REPORT.**

The reason for the appointment of the Committee was the increasing number of fatal accidents in the metropolis, due to motor omnibuses and other forms of power-driven vehicles. In pursuing this inquiry, the Committee held 42 sittings and examined 54 witnesses. They found it impracticable to consider the question of safety separately from the general traffic problem of London. Referring to the Royal Commission on London Traffic, which reported in 1905, the Committee observed that many of their recommendations, if carried out, would have tended in the direction of public safety, and most of those recommendations have only become more urgent in the time elapsed since they were made. The changes which have taken place since 1905 are due to the development of mechanical traction, as will be seen from the statistics appended:—

| | Horse Cabs. | Horse Omnibuses and Tramcars. | Electric Cars and Motor Omnibuses. | Motor Cabs. |
|---|---|---|---|---|
| 1907 ... ... | 9,818 | 2,961 | 2,973 | Nil. |
| 1912 ... ... | 2,385 | Nil. | 5,767 | 8,000 |

The difficulties described in the report of the Royal Commission

Digitized by Google

have been intensified by this change. The development of the inward and outward current of travel is shown by the following figures:—In 1904 the journeys taken per head of population amounted to 150, and this figure has increased to 228 per head. The total numbers for 1911 are:—

| | |
|---|---|
| Tramway passengers ... ... ... ... | 821,819,741 |
| Omnibus passengers ... ... ... ... | 400,628,487 |
| Local railway passengers ... ... ... | 436,398,745 |
| Trunk railway passengers from a 30 mile limit | 250,000,000 |
| | 1,908,846,973 |

The daily increase is not less than 250,000, and by 1920 it is estimated that the number of journeys will exceed 3,000,000,000. During the last three years the fatalities have increased enormously, and the amplification of the traffic has outgrown the methods for dealing with it. A dictator for half a dozen years would have a difficult task, owing to the inherent physical obstacles he would have to encounter. In London such a solution is, of course, impossible, and the Committee consider that existing institutions must be used, with such developments as experience dictates, and with proper regard to existing rights and interests.

The Committee have had forced upon them the conclusion that a speeding up of every department of municipal and parliamentary government is necessary. Control of the streets is essentially a municipal function, and the same men should have before them the question of the adequacy of the streets, the facilities for traffic and its regulation, and the safety and convenience of pedestrians. Parliament could not be expected to deprive itself of power to secure equitable arrangements in the local legislation which it enacts, and in the supervision of local affairs by the various departments of State. It remains, therefore, so to adjust the municipal institutions of the metropolitan area and the instruments by which Government exercises control, that the public may feel confidence in the justice and impartiality of the decisions taken.

The Committee does not feel that a comparison between tramway and non-tramway streets, to which considerable importance was attached by Sir E. Henry, was of much assistance in indicating to them any method of securing greater safety; for fatal accidents are quite as numerous in streets where there are no tramways as in those where such lines exist. Mr. A. H. Stanley, who gave evidence on behalf of the London General Omnibus Company, did not lay any stress on the presence of tramways.

The table handed in by Colonel Hellard brings out a very striking comparison showing that electric railways have an immensely more favourable record for injuries, and for fatalities a record equal to tramways, and much superior to the omnibuses. The character of public vehicles on the streets closely affects the question of public safety. The design of tramcars is subject to two bodies—the Board of Trade and the Metropolitan Police. The Board of Trade have to inspect every tramway before it can be worked, and have made it a rule that promoters shall submit drawings of their cars before they have them built. The brakes of the London County Council are the most powerful known. While the brakes of some of the other tramway systems do not, perhaps, come quite up to the London County Council standard, they are considered satisfactory by the Board of Trade. Powers possessed by the police enable them to refuse a licence until they are satisfied that the brake is in proper working order, and they also inspect cars on the streets at any moment that seems fit to them. The Committee think, however, that the control of the brakes by one department should be sufficient, and that the experience of the Board of Trade fits it for this responsibility. The minimum of inspection while the vehicle is actually on the streets should be aimed at, and the management should be responsible for a system of daily inspection which will ensure that no vehicle will appear on the streets in an improper condition. The design of safety guard which has been adopted by the London County Council tramways has proved very effective, and has been approved by the Board of Trade.

## DEVELOPMENT OF THE MOTOR OMNIBUS.

The London General Omnibus Company afforded the fullest details to the Committee of its methods of working and control. While some points are open to criticism, on the whole the Committee recognise that the company is managed in a most capable manner. Motor omnibuses commenced to run in London in 1897, and their development has been exceedingly rapid. From the first type of omnibus employed down to the present "B" type there have been thirty-two designs, all of which have had to conform to the regulations of the Local Government Board as to heavy motors and the requirements of the Chief Commissioner of Police. The latter had a very difficult part to play in this development, as he had to protect the public and yet to permit that street experience which could alone make the vehicle permanently safe for public use. The accident record of the motor omnibus is set out below:—

| Year. | Licensed. | Fatalities. | Per 1,000 'Buses. |
|---|---|---|---|
| 1907 ... ... | 1,205 | 35 | 29.0 |
| 1908 ... ... | 1,133 | 62 | 54.7 |
| 1909 ... ... | 1,180 | 59 | 50.0 |
| 1910 ... ... | 1,200 | 70 | 58.3 |
| 1911 ... ... | 1,902 | 114 | 58.1 |
| 1912 ... ... | 2,908 | 182 | 62.6 |

Further improvements in design are foreshadowed, but not with great confidence. Mr. Worby Beaumont in his evidence before the Committee said that he hoped for solid tyres for omnibuses made so that they will offer the probability of very greatly reducing, if not eliminating, the side-slipping danger. Some criticism was made on the type of brake on the motor omnibus in evidence from representatives of drivers, but Mr. Beaumont stated that the brakes were fully competent to hold the driving wheels tight and prevent their rotation. The difficulty lies not so much in the brake as in the vehicle, and its responsiveness to the brake on a smooth road. According to the evidence submitted, there appears to be great difficulty in securing a satisfactory lifeguard to motor omnibuses. The London General Omnibus Company have a staff of a dozen men continually experimenting, but no progress appears to have been made.

The Committee say they have not exhausted the question whether a lighter omnibus would not avoid many of the present dangers. If reducing the weight would make the vehicle much more safe, the financial effect should not be given too much weight, and it is a problem which expert advisers might decide. Mr. Beaumont was of opinion that the omnibus is not too heavy and too powerful for the brakes, in view of the present conditions of London traffic. He considers a lighter vehicle desirable from other points of view.

He also stated that in addition to acting as technical adviser to the Chief Commissioner, he was technical adviser to the motor omnibus companies; and the Committee think that the technical adviser to the Chief Commissioner should be an independent official.

Both the tramcar and motor omnibus are dangerous vehicles from their weight and bulk and the power of their engines, and the systematic training of drivers is consequently a necessity. The Committee feel that the practice which prevails of paying motor omnibus drivers by the journey is inimical to safe working in crowded traffic.

## STOPPING PLACES.

The position of tram lines in the middle of the roadway raises a very acute traffic problem, which the Committee discuss at some length. This difficulty is aggravated by the presence of the motor omnibus, which exaggerates the danger while tramway passengers are crossing to and from the pavement. In connection with this cutting in upon tramway passengers, the question of stopping places for both tramcars and omnibuses appears to arise. A new solution, which seems to approve itself to the Committee, is that representatives of the local councils, tramway and omnibus authorities, and the Police Commissioner should meet and consult together. In this way it is hoped that a solution will be found for what has hitherto been a real difficulty. The Committee think that if there were present at this meeting an independent chairman from the Government department, a method of minimising friction and promoting safety would be secured.

The London County Council proposed a by-law to the following effect:—"No driver of an omnibus or other stage carriage shall stop such omnibus or stage carriage to take up or set down passengers in such a position in the immediate vicinity of any tramway stopping place as to cause obstruction to passengers or intending passengers alighting from or entering any tramcar."

The Committee think the principle suggested to be reasonable. As regards speed, the Committee do not recommend any alteration of the maximum for tramways nor for motor omnibuses, and they are of opinion that the procedure by which speed limits are fixed is satisfactory, and that the County Councils are the proper authority through which applications should be made, local opinion being duly heard. The Committee are of opinion that both tramcars and motor omnibuses should be fitted with speed registers as soon as practicable. Slow moving traffic is the cause of great delay, and the Committee recommend that a by-law should be immediately passed putting into operation the recommendations of the Royal Commission of 1905 that all vehicles proceeding at a slow or walking pace should be required to keep as close as practicable to the kerb. A serious cause of congestion within the inner ring is the existence of tramway "dead ends," and the Committee repeat the comment of the Royal Commission that it was difficult to appreciate how such a state of things could be tolerated so long, and whatever view might be held of the expediency of extending tramways in London, it cannot be expedient to work those we have upon inefficient methods.

Evidence was given which showed that there was considerable risk of accident and obstruction arising from the presence of many vehicles in an unsound condition, and the Committee considered it desirable that a by-law should be framed imposing penalties on any driver or owner who knowingly sent out an unsound vehicle.

## STREET WIDENINGS AND CONTRIBUTIONS OF TRAMWAYS AND OMNIBUSES.

The running of motor omnibuses has had considerable influence upon the question of street widenings. When widenings are made for tramways the tramways bear a large proportion of the cost, on the ground that they are introducing through traffic which did not before exist. Motor omnibuses are now running down similar streets, and they introduce through traffic which produces necessity for street widening, but provide no revenue to pay for it. Tramways also pay for paving the track and a portion at each side. These costs, with rates and taxes, are represented as being a charge of about £200 per car annually. A paragraph in the Report of the London Traffic Branch of the Board of Trade for 1911 states that omnibus companies pay no rates in respect of the roads which they use, but motor omnibuses pay "in the shape of the petrol tax about £45 per vehicle per annum. . . . Of the two, the tramways are less unfavourably situated in regard to these burdens." Colonel Hellard, head of the London Traffic Branch of the Board of Trade, who was not responsible for that volume, admitted the comparison was incorrect, and withdrew it.

When asked if he had to pay towards track and road improvements and rating on track equivalent to what the London County

Digitized by Google

Council has, of £200 per vehicle, Mr. Stanley said he thought it would mean to the motor omnibus proprietors of London a sum somewhere about £600,000.

### ABOLITION OF THE LOCAL VETO.

As regards Parliamentary procedure, the Committee alluded to the obstruction offered to the building of tramways by the Metropolitan Borough Councils which have the right of veto, and they found that the extreme use of the veto goes beyond the purpose for which it was intended. The veto was originally granted to local authorities to prevent them being harassed with speculative schemes promoted by private interests. It was not at that time contemplated that there would be a central municipal authority which would become the sole tramways promoter in London. Standing Order 22 of both Houses of Parliament was meant to secure that local authorities should be consulted before private tramway schemes were submitted to Parliament, but the same check is no longer necessary to safeguard public interests. The Committee agree with the conclusions of the Royal Commission that any reasonable objection to the abolition of the veto would disappear after provision were made for the local authorities to state their views concerning any proposed tramway scheme to an independent and impartial body such as the new traffic branch which the Committee recommend.

### THE TRAFFIC BOARD AND ITS DUTIES.

It is agreed by all parties that the development of the motor omnibus has rendered very great service to London, but the omnibus has yet to be put under proper control. After careful consideration of the matter the Committee are of opinion that the routes, time-tables, and number of such carriages should be subject to regulations formulated by County Councils and County Borough Councils and confirmed by the new Traffic Branch with a right to local authorities and others interested to be heard. The Committee have carefully considered the question of machinery best to be used in controlling and providing for London traffic. These powers and duties are at present scattered, duplicated, and incomplete. The bodies to which they are entrusted are very numerous, and tenaciously uphold local interests. It becomes a question, not of setting up an ideal system which might meet with a maximum of opposition, but of utilising as far as possible existing bodies and laws, so as to enable them to meet the changed conditions with the least friction and delay. The Committee are of opinion that what is required is a new arrangement of the functions of Government departments. The duty of originating and accommodating traffic schemes and regulations is in their opinion a municipal duty. Co-ordination can be secured by consultation between adjoining municipal authorities, under the direction and advice of a Government department, which is itself properly constituted to meet the special conditions. In the outer London ring there are five counties, and each has within it many authorities. They cover an area of some 600 square miles. There are in addition the Metropolitan Borough Councils, which are important bodies with great financial resources behind them and representing important interests.

The Committee believe that the arrangements they suggest will be such as to secure their confidence. At present, as has been set out, no one Government department fulfils the requirements. The Committee contemplate a body of sufficient standing to command the respect and confidence of Parliamentary Committees and of all the municipal authorities with which it will come in contact. It should supersede or absorb the London Traffic Branch of the Board of Trade. It should consist of a small number of specially qualified persons, and the choice should not be limited to Government officials. Expert advice of the highest character should be put at its disposal. The Committee do not propose that the body should be a separate Government department, but recommend that it should be a branch of the Board of Trade.

The duties of the New Traffic Branch as briefly outlined by the Committee are as follow :—

All schemes relating to London Traffic presented to Parliament should be examined and reported upon by it, and no other Department should report to Parliament, except through it.

It should actively concern itself with the traffic problems of London, working through and in harmony with the various existing bodies responsible for the various areas.

It should hold conferences, if requested or by its own motion, with the representatives of various municipal authorities concerning the development of through traffic routes, and other matters in which common action or agreement is advisable.

It should have power to hold public inquiries in order that the interests of localities may be ascertained, and due weight given to them in consideration of all projected undertakings or new by-laws. It should have power to summon witnesses.

All by-laws relating to London traffic should come before it for confirmation. It should be the confirming authority for the regulations of County Councils and County Borough Councils as to routes, etc., of stage carriages; and should hear appeals from the decisions of Councils.

It should fix where it considers necessary, on the application of a local authority, special speed limits for motor omnibuses and speed limits for all motor traffic.

It should have power to regulate the structural character of all stage carriages.

It should receive reports, from the police and parties concerned, of all traffic accidents, and special reports from coroners of inquests.

Other duties might be laid or devolved upon it as experience suggests.

## NEW AND PROSPECTIVE WORK.

READING TOWN COUNCIL, after a long discussion at the meeting held last week, decided to promote a railless trolley Bill in the next session of Parliament.

CANADIAN ELECTRIC RAILWAY.—It is reported from Canada that the Canadian Pacific Railway is about to commence the construction of an electrical line from Hamilton to Niagara Falls. By its construction the Canadian Pacific Railway will be in a position to handle traffic direct from Hamilton to Buffalo on their own lines, and it will be no longer necessary to run traffic over the routes of other companies.

DIESEL GENERATING SET FOR FELIXSTOWE.—Mr. H. R. Hooper, on behalf of the Local Government Board, has held an inquiry into the application of the Felixstowe Urban District Council for sanction to borrow £4,729 for the extension of the electric supply plant, by the provision of a 150 kw. Diesel generating set. The inspector elicited the fact that the Diesel set was required to supersede some old gas engines, and after discussion it was decided to amend the application, the sum asked in revision being £2,800.

DONCASTER TOWN COUNCIL have agreed to purchase six additional tramcars at an estimated cost of £5,000 and to enlarge the car shed at the cost of £750. The question of buying six or eight motor omnibuses to run between Doncaster and outlying districts is being considered.

NEW CAR SHED FOR ROTHERHAM.—Rotherham Electric Light and Tramways Committee have recommended the acceptance of the tender of Messrs. Chadwick and Company for the extension of the car sheds in Rawmarsh Road at £11,643. After some discussion the Council approved the recommendation of the Committee. Alderman Winter, chairman, said that the subject had been talked about for months, and it was essential that the cars should be housed as early as possible.

NEW CARS FOR DUNDEE.—Dundee Tramways Committee have authorised the tramways manager to obtain tenders for four additional cars.

ROTHERHAM BOROUGH COUNCIL propose to apply to the Board of Trade for a provisional order authorising the construction of electric tramways along the new street in Millgate and adjoining streets, so as to connect the route with the present tramways.

SOUTH SHIELDS.—The Town Council have adopted a recommendation to borrow £30,000 for the purpose of installing a new generator set and other plant at the electricity works.

## MISCELLANEOUS NEWS AND NOTES.

**Heston and Isleworth Urban District Council** have agreed to suspend their power to acquire the undertaking of the London United tramways within their district until 1930.

**Tubes Suggested for Glasgow.**—The Corporation is considering the appointment of a special committee, which will be charged with the duty of reporting on a scheme of electric tube railways between the east and west of the city.

**Indian Rules for Motor Cars.**—The Government of India is reported to be considering the question of consolidating the provincial rules relating to motor cars with the object of securing uniformity and convenience for the travelling public. Possibly legislation may be undertaken in connection with this matter in the near future.

**Record Traffic at Burnley.**—Councillor Heap, chairman of the Tramways Committee, at a recent meeting of the Burnley Town Council, said that for the five days covering the period of the Royal Lancashire Show the tramways carried 437,795 passengers, and the receipts amounted to £2,414. This established a record for the Burnley tramways.

**Municipal Tramways Conference.**—At a meeting of the Sheffield City Council this week, Sir William Clegg said that in connection with the forthcoming visit of the Municipal Tramways Conference in September arrangements for extending "Sheffield and Yorkshire hospitality" were well in hand. The Lord Mayor proposed to extend hospitality in a very marked degree.

**Employees' Agitation in Dublin.**—The Dublin tramway employees are making an application for a further all round increase of 2s. 6d. per week. It appears that the men were not willing to accept as satisfactory the increase of 1s. a week recently granted by the directors. Agitators are encouraging the men to strike, and there is some fear that they may be misguided enough to do so.

**Standing Compartments in Bombay Cars.**—Bombay Council have adopted a recommendation by the Tramways Committee that the company be allowed to introduce two standing compartments in their bogie cars for a period of three years from January, 1914, to provide accommodation for passengers during the crowded hours of traffic. The passengers are to be allowed to stand, the convenience having been demanded by the public.

**Position of Glasgow Tramways.**—Assuming that there are no further extensions, the Glasgow tramways will be free from debt within four years. After this time the annual surplus should be a very large one, amounting from £200,000 to £400,000, and a writer in the "Glasgow Evening News" asks how this large sum will be disposed of. Hitherto very liberal allowances have been made to the depreciation and reserve accounts, so that no less a sum than £2,040,000 stands at the credit of the depreciation and permanent-way renewal funds. Of that amount £1,852,500 is invested with the Common Good.

Digitized by Google

**Glasgow Corporation and Omnibuses.**—Glasgow Tramways Committee propose to make application for further powers to run omnibuses in the city and in the adjoining districts. Authority will also be asked to deal with the frequent and serious interruptions to the car service through obstructions on the track, caused by the breaking-down of, out of repair, or overloaded vehicles, and, in the event of proved negligence, to charge for the cost of the removal and loss caused by the interruption.

**The Newburn Tramways.**—A further portion of the Newcastle Corporation tramways between Scotswood and Newburn will shortly be available for public service. Colonel Von Donop, the Board of Trade inspector, examined the route to Sandy Banks a fortnight ago, but advised that cars should not be run from Lemington to that point until they were supplied with mechanical slipper brakes. This has been done, and the cars will travel from Scotswood to Sandy Banks, which is close to Newburn Steel Works.

**Tramway and Omnibus Passengers in London.**—Mr. Buxton (President of the Board of Trade), replying to Mr. W. Rea in the House of Commons on Wednesday, said that the number of passengers carried by tramway authorities working in Greater London during the year ended December 31, 1912, in the case of companies, and March 31, 1913, in the case of local authorities, amounted to 798,672,549, and the number carried during 1912 by omnibuses was upwards of 500,000,000. The corresponding figures for the first half of 1913 could not be given.

**Siding Accommodation to Avoid Delay.**—Leeds Tramways Committee recommend that siding accommodation be provided in Roundhay Road at the junction with Harehills Road. Harehills is the terminus for a number of routes. Beeston cars, Haddon Place cars, Victoria Road cars, and Whitehall Road cars all turn back at Harehills, and proceed a few yards past the terminus on the up line, wait their turn there, and then run over the cross line on to the down line. Until the operation is completed they block the line to Roundhay, the Roundhay cars often having to wait some minutes before they can move.

**The New Pattern Cars at Liverpool.**—Representatives of the Glasgow tramways recently visited Liverpool and inspected the car designed by Mr. Mallins, having a separate entrance and exit on the platform. A Glasgow journal says:—"It is understood that the Liverpool management is delighted with the experiment, and that at least a score of the new cars have been ordered. Nevertheless, it is a moot point whether the latest type would suit the unrivalled rushes which are made at the car stations in central Glasgow at least." The Liverpool cars were described and illustrated in our issue of November 12, 1912.

**Bristol Corporation and the Tramways.**—As mentioned in our issue of August 2, Mr. J. B. Hamilton, general manager of the Leeds Corporation Tramways, and Mr. J. F. C. Snell, consulting engineer, have been engaged in the preparation of their report in connection with the possible purchase of the tramways by the Corporation on May 1, 1915. Under section 43 of the Tramways Act, 1870, the Corporation will at that date have the option of taking over the lines. The special committee of the Council appointed to consider the matter have held several meetings, and it is understood that they will be in a position to report to the Council in September.

**Tramways v. Motor Omnibuses at Oxford.**—The latest plan for providing Oxford with a modern electric tramway service is arousing a good deal of opposition, and an agitation in favour of motor omnibuses instead of tramcars is proceeding energetically. The position is, however, that the National Electric Construction Company have an agreement with the City Council, under which the former are to run electric tramcars, and without their consent it will be impossible to substitute motor omnibuses. The probability is that the electric system will in due course be introduced. The date at which the National Electric Construction Company will undertake to complete the electrification of the tramways has not yet been fixed.

**Middlesex Tramways.**—Representatives of the Middlesex County Council Light Railways and Tramways Committee visited Acton recently, and with representative members and officials of the Acton Council discussed the possibility of effecting a physical connection between the M.C.C. Tramways, terminating at Horn Lane, and the London United Electric Tramways passing along the High Street within a hundred yards of Horn Lane. The proposal has emanated from the Middlesex County Council, and is to the effect that the connecting line shall be laid through King Street, joining the London United Tramways by turning in a westerly direction. The outcome of such a junction would be that passengers between Ealing, West Acton, and Willesden would probably be able to reach their destination without changing cars. This would, of course, be of considerable benefit to the travelling public, besides which, anyone can foresee other possibilities if a physical connection should be agreed upon.

**Nottingham and Derbyshire Tramways.**—The Nottinghamshire and Derbyshire Tramways Company, the whole of whose issued shares and debenture scrip were acquired by the Tramways, Light and Power Company, Limited, of 22a, College Hill, Cannon Street, E.C., in 1912, has various powers for the construction of tramways in the counties of Nottingham and Derby and the city of Nottingham, and running powers over certain of the Nottingham Corporation tramways. The directors of the company are the Rt. Hon. Viscount Chilston, Mr. A. A. Holland, and Mr. George Balfour; the secretary is Mr. W. Bryden. The line, which is now in course of construction, has an aggregate length of about 13½ miles, and will connect Ripley with the city of Nottingham. Contracts for construction are being carried out by Messrs. Balfour, Beatty and Co., Limited. As mentioned in our last issue, the new system was opened between Heanor and Cinder Hill on August 7 after inspection by Lieut.-Colonel Druitt, of the Board of Trade. The new cars, which are painted in a pale yellow, gold, and green are much admired. Good progress is being made with the construction of the connecting line from Cinder Hill to Basford. A good deal of road widening is necessary as well as some displacement of gas and water mains, while two canal bridges have had to be strengthened. The new line will bring such populous districts as Codnor, Heanor, Langley Mill, Eastwood, and Kimberley into touch with Nottingham.

**Railless Traction in Lancashire.**—After a series of satisfactory trial runs the Board of Trade inspection took place on Monday last of a new railless system laid down by the Urban District Council of Ramsbottom, near Bury, Lancashire. The omnibuses will run between a spot close to Holcombe Brook Station, on the Lancashire and Yorkshire Railway, and the hamlet of Edenfield, on the road to Rawtenstall, passing through Ramsbottom and calling at Ramsbottom Station, a distance of about five miles. This will open quite a new but hilly district containing some of the finest scenery in the country. The results of the venture are being closely watched by the adjoining local authorities; if satisfactory the system will be extensively adopted by them to serve their respective tramways. As it is, the Edenfield terminus being a short two miles from the Rawtenstall, a short walk or run on the high pressure electric trains over the three miles Bury to Holcombe (lately opened by the L. and Y. Railway), will enable the residents of Manchester and district to reach North-East Lancashire by a shorter route than the one through Rochdale and Bacup; moreover, Ramsbottom will now possess the means of transit due to its size and importance. The omnibuses are similar to those at Stockport and Leeds, with certain improvements in the fittings. The current is being supplied by the Lancashire Electric Power Company, and the Railless Electric Traction Company are the contractors for the equipment. The usual double trolley and four overhead wires are provided with loops at the termini to save reversing.

## CONTRACTS AND ORDERS.

**Vickers, Limited,** have an order for 125 tramcar wheel tyres from Sheffield Corporation.

**Messrs. C. Richards and Sons** have an order from Salford Corporation for single-ended tie-bars for tramways.

**W. S. Laycock, Limited,** have supplied rollers and blinds to Walsall Corporation for cars now being fitted with vestibules.

**Watlington and Company, Limited,** have an order from Stockport Corporation Tramways Committee for pressed steel gear cases.

**Bolton Electricity Committee** has accepted the tender of Stewarts and Lloyds for steam and hot water pipes for their new station.

**Chamberlain and Hookham, Limited,** have received a contract from Rotherham for meters of 10 amperes capacity and upwards.

**Sheffield Corporation** have placed an order with Messrs. Longbottom and Company for coal for the generating station at 9s. 11d. per ton.

**Siemens Brothers and Company, Limited,** will supply a high-tension switchboard to Bexley Urban District Council, at a price of £867.

**The Electric Construction Company** have received a contract from Blackburn Corporation for the supply of electric motors for the electricity department.

**The Atlas Resilient Road Wheel Company, Limited,** have received an order from Stockport Corporation for a set of spare wheels for trackless trolley vehicles.

**Edgar Allen and Company, Limited,** are to supply six 15ft. lengths of manganese rail, with fish-plates, bolts, etc., for a section of the Temple Mills curve of the Leyton tramways.

**Manchester Corporation Tramways Committee** have accepted tenders for tramcar trucks from the Brush Electrical Engineering Company, and for tramcar wheel centres from Edgar Allen and Company.

**The Brush Electrical Engineering Company's** tender for 25 double-deck top-covered extended canopy cars has been accepted by Sheffield Corporation at £640 per car, plus 5 per cent. for contingencies.

**The Lea Recorder Company, Limited,** will supply and erect a combined indicator and recording water meter, including tank and float chamber, for Sheffield Corporation. The contract amounts to £880.

## PERSONAL.

**Mr. R. Leigh Griffin** arrived at Southampton on August 9 from Santos on three months' leave.

**Mr. F. P. Seager** has been appointed shift engineer at Manchester at a commencing salary of £175.

**Bailie W. B. Smith,** convener of the Electricity Committee, and Mr. W. W. Lackie, chief electrical engineer, will shortly leave Glasgow for the United States and Canada, where they propose to inspect the largest electrical installations, as mentioned in a recent issue.

**Mr. J. S. D. Moffet,** who is vacating the position of manager of the Rochdale Corporation Tramways, to take charge of the West Ham undertaking, has been presented by the employees of the Rochdale tramway department with a handsome silver double entree dish and a silver hot water jug. Inspector Venting made the presentation on behalf of the employees, and when handing

Digitized by Google

the gifts to Mr. and Mrs. Moffet said that they were a token of the respect which the employees felt for Mr. Moffet, who had been manager since 1904. In replying, Mr. Moffet said that the system had grown into a large and important undertaking, and he was proud of all branches of the service. He was glad to think that, in spite of any dispute which had arisen during his management, there had always been a good feeling between himself and his employees. Several other speakers referred appreciatively to Mr. and Mrs. Moffet's interest in the various branches of the undertaking.

## FINANCIAL REPORTS AND MEETINGS.

**Hadfield's Steel Foundry Company.**—The directors recommend an interim dividend of 5 per cent., free of income-tax, on the ordinary shares for the past half-year.

**The British Electric Traction Company.**—The receipts of all the associated companies of the British Electric Traction Company for the week ended August 8 amounted to £67,350. Upon such of the lines as were working both last year and this year the receipts show an increase of £0,335 upon the week.

**Edison Accumulators, Limited.**—This company was registered on August 5 with a capital of £150,000 in 135,000 7 per cent. participating preference shares of £1 each, and 300,000 ordinary shares of 1s. each. The first directors, to number not less than three and not more than eight, are Lord Montague of Beaulieu, 62, Pall Mall, S.W., Colonel H. C. L. Holden, Gifford House, Blackheath, A. L. Pearce, Worcester House, Walbrook, E.C., and J. F. Monnott, 49, Old Broad Street, E.C.

**Manaos Tramways and Light.**—At the meeting held on Thursday last the chairman, Mr. I. M. Booth, reported that the company had been unable to recover from the State of Amazonas the debt of £23,676 due to them. A dividend of £4 per cent. was passed after making due provision for reserve funds, and £3,450 was carried over. The tramway receipts have decreased while the income from lighting has increased; the gross income having increased from £147,280 to £15,741, while the working expenses have fallen from 76½ per cent. to 57.2 per cent.; the result being that the net surplus shows an increase of 72 per cent.

**Tyneside Tramways and Tramroads Company.**—The half-yearly meeting was held in Newcastle on August 11, when Dr. J. T. Merz, chairman, who presided, said that there had been an appreciable increase in the revenue and the dividend. The traffic receipts showed an increase of £1,049, as compared with the corresponding period of last year, and the surplus of receipts over expenses amounted to £5,446. With the balance brought forward from the last half-year of £427, there was a total of £5,873, and after deducting interest on debentures, etc., amounting to £1,009, the available balance was £4,804. This balance has been appropriated as follows:—Dividend on preference shares at the rate of 5 per cent. per annum, £601; dividend on the ordinary shares at the rate of 3 per cent. per annum, £2,008; to reserve for renewals, depreciation, etc., £1,200; reduction of registration and formation expenses, £330; leaving £724 to be carried forward. The chairman intimated that the directors had decided to invest the large balance in hand in trust securities to yield 4 per cent. per annum. It appeared from the report that the amount at the credit of reserve for renewals, depreciation, and other contingencies, was £14,538.

**Walter Scott, Limited.**—The trading profits of Walter Scott, Limited, for the year ended June 30 were £91,303, and £655 was brought forward. Debenture interest absorbs £12,000, and directors' fees £1,500. A final dividend of 7½ per cent. is proposed on the ordinary shares, making 10 per cent. for the twelve months, adding £24,676 to the reserve funds, writing £6,750 off investments, and carrying forward £1,623. The board report that the output at the steel works and collieries considerably improved upon the previous year, but the brick and cement works remained in a languid condition owing to the stagnation in the building trade. Electric generating plant, consisting of two mixed flow turbine generators with necessary machinery complete for pumping and haulage, has been installed at East Hetton Colliery; and at Trimdon Grange a battery of 55 patent coke ovens, with coal washery and by-product plant, has been erected. The trading profits for 1911-12 were £55,552, for 1910-11 £45,536, for 1909-10 £49,537, and 1908-9 £9,830. Twelve months ago two years' dividends were paid on the preference shares and £10,428 reserved. In 1911 and 1910 a year's dividend was paid on those shares, sums of £10,121 and £17,537 set aside, and £5,027 and £1,112 carried forward, but in 1909 no distribution was made. £682 remaining after providing for debenture interest.

## WEEKLY TRAFFIC RETURNS.

The official traffic returns of 67 of the principal undertakings of the United Kingdom for the week ended August 9 amounted to £287,743, or £26,879 more than in the corresponding week last year, while the track mileage was 2,712, or 52 more than for the corresponding week. The receipts were at the rate of £106 2s. per track mile, an increase of £8 0s. 8d. per mile as compared with last year.

**Messrs. Thermit, Limited,** have removed into larger and more convenient works at 675, Commercial Road, London, E., to which all goods should in future be sent. All communications should be addressed to 27, Martin's Lane, Cannon Street, E.C., as before. Their telephone number has also been altered, and is now 4202 City (2 lines).

## COPPER AND ALUMINIUM MARKET.

August 15, 1913.

Messrs. Henry R. Merton and Co., Ltd., 2, Metal Exchange Buildings, Leadenhall Avenue, E.C., supply the following quotations of prices per ton:—

**Telegrams: "TRAMIGRO, LONDON."**
**Telephone; No. 2948 GERRARD.**

# WEEKLY LIST OF TENDERS INVITED.

### BOROUGH OF BASINGSTOKE.

ELECTRIC LIGHTING.

The Corporation of Basingstoke invites tenders for the supply and erection of the following plant:—

Section A.—Diesel Generators, Balancer Set and Booster Set.
" B.—Storage Batteries.
" C.—Switchboard and Instruments.
" D.—Cables and Cable Laying.
" E.—Overhead Travelling Crane.

Contractors may tender for any section, but not for part of a section.

Particulars of the above sections, together with general conditions and forms of tender, are bound up in one specification, and may be obtained at the office of the undersigned on payment of three guineas, which sum will be refunded on the return of the specification filled up with a *bonâ-fide* tender, which shall not subsequently be withdrawn.

Duplicate specifications can be obtained at an additional cost of half a guinea each, not returnable.

Tenders, endorsed "Electric Lighting," must be delivered by 5 p.m. on Wednesday, September 17, 1913.

The Corporation does not bind itself to accept the lowest or any tender.

F. REGINALD PHIPPS, A.M.Inst.C.E., F.S.I.,
Borough Engineer.

Town Hall, Basingstoke,
August 14, 1913.

### BOROUGH OF HAMMERSMITH.

The Borough Council invites tenders for the supply of:—

(*a*) High and Low Tension Underground Electric Supply Cables.

(*b*) High Tension Sub-Station Switchgear

Copies of specification, form of tender, and further particulars may be obtained from Mr. G. G. Bell, Engineer and Manager, 85, Fulham Palace Road, Hammersmith, London, W.

Sealed tenders, endorsed "Tender for Cables" or "Tender for Switchgear," must be delivered to me at the Town Hall, Hammersmith, not later than 4 p.m. on Wednesday, September 24, 1913.

The Council does not bind itself to accept the lowest or any tender.

LESLIE GORDON,
Town Clerk.

Town Hall, Hammersmith, W.,
August 21, 1913.

### GAINSBOROUGH URBAN DISTRICT COUNCIL.

PETROL MOTOR FIRE ENGINE.

The above Council are prepared to receive tenders for the supply of a new Steam or Petrol Motor Fire Engine, capacity 350 to 450 gallons per minute.

Further particulars may be obtained upon application to S. W. Parker, Engineer and Surveyor.

DECIMUS M. ROBBS,
Clerk to the Council.

Council Offices, August 16, 1913.

### CITY OF CARDIFF.

The Cardiff Corporation invite tenders for the supply, delivery, and erection of the following plant at their Roath Power Station:

1. A 2,000 kw. Turbine Alternator with Surface-Condensing Plant and Auxiliaries.
2. A 700 kw. Rotary Converter.
3. Boiler House Plant in three Sections. Tenders will be considered for either Section, but not for a portion only of a Section.

Section (a). Water-Tube Boilers, Superheaters, Stokers, etc.
Section (b). Turbine-Driven Feed Pump and Heater.
Section (c). Fuel Economiser.

Specification and forms of tender may be obtained from Mr. Arthur Ellis, City Electrical Engineer and Manager, Central Offices, The Hayes, Cardiff, on payment of a deposit fee of one guinea for either of the three specifications, which sum will be returned on receipt of a *bonâ-fide* tender. Further copies may be had if desired at a charge of 5s. 0d. per copy, which will not be refunded.

Sealed tenders, endorsed "Electrical Extensions, Section —," to be delivered to the undersigned not later than noon on Friday, September 12, 1913.

J. L. WHEATLEY
Town Clerk.

City Hall, Cardiff,
August, 1913.

### EDINBURGH CORPORATION.

ELECTRICITY SUPPLY.

The Lord Provost, Magistrates, and Council invite tenders for the following work in connection with their Electricity Supply Station at MacDonald Road:—

Specification No. 27.—Two Mixed Pressure Steam Turbines and Direct Current Generating Plant; each set to be of 1,500 kw. capacity.

Copies of the specification, form of tender, general conditions, and drawing can be obtained from the Engineer, Dewar Place, Edinburgh, on and after Wednesday, August 27, on payment of a deposit of £2 2s., which deposit will be refunded on receipt of a *bonâ fide* tender, and on the return of the specification, general conditions, and drawing. The specification, general conditions, and drawing may be seen at, but not obtained from, the office of Sir A. B. W. Kennedy, 17, Victoria Street, London, S.W.

Tenders, on the prescribed form, enclosed in sealed envelopes, and endorsed on the outside "Electricity Supply, Tender to Specification No. 27," must be delivered at the office of the undersigned not later than the 22nd day of September next.

THOS. HUNTER, LL.D., W.S.,
Town Clerk.

City Chambers, Edinburgh,
August 19, 1913.

### THE GREAT INDIAN PENINSULA RAILWAY COMPANY.

The Directors are prepared to receive tenders for the supply of the following Stores, namely:—

Tie Bars, Gibs and Cotters.
Steel Rails and Fishplates.
Steel Fishbolts, etc.
Cast Iron Sleepers.

Specifications and forms of tender may be obtained at this office on payment of the fee for the specification, which payment will not be returned.

Tenders must be delivered in sealed envelopes, addressed to the undersigned, marked "Tender for Tie Bars, Gibs, and Cotters," or as the case may be, not later than 11 o'clock a.m. on Thursday, September 4, 1913.

The Directors do not bind themselves to accept the lowest or any tender.

R. H. WALPOLE,
Secretary.

Company's Offices,
48, Copthall Avenue, London, E.C.,
August 21, 1913.

Digitized by Google

## COUNTY OF LONDON.

The London County Council invites tenders for additional Main High-Tension Switchgear, including the reconstruction of existing Main High Tension Switchgear at the Council's Generating Station, Greenwich.

Persons desiring to submit tenders may obtain the specifications, bills of quantities, form of tender, etc., on application to the Clerk of the Council, at the County Hall, Spring Gardens, S.W., upon payment to the Cashier of the Council of the sum of £2. This amount will be returnable only if the tenderer shall have sent in a *bonâ fide* tender, and shall not have withdrawn the same. Full particulars of the work may be obtained on personal application, and the drawings, specification, and other contract documents may be inspected at the County Hall before the payment of the fee.

The contractor will be bound to pay to all workmen employed by him in and about the execution of the contract, or any part thereof, wages at rates not less, and to observe hours of labour not greater, than the rates and hours set out in the Council's list, and such rates of wages and hours of labour will be inserted in and form part of the contract by way of schedule. Full particulars of the Council's Standing Orders on these matters are given in the *London County Council Gazette*. Tenders must be upon the official forms, and the instructions therein must be strictly complied with. No tender received after 11 a.m on Tuesday, September 23, 1913, will be considered.

The Council does not bind itself to accept the lowest or any tender, and it will not accept the tender of any person or firm who has withdrawn a tender after the same had been opened, unless the reasons for withdrawal were satisfactory to the Council.

JAMES BIRD,
Deputy Clerk of the London County Council.

County Hall, Spring Gardens, S.W.,
August 16, 1913.

## COUNTY BOROUGH OF SOUTHAMPTON.

TO TAILORS AND OTHERS

The Corporation invite tenders for the supply of about 180 pairs of Blue Serge Trousers suitable for winter wear for the employees of the Tramways Department.

Form of tender, with conditions and particulars, may be obtained and pattern inspected at the Tramway Offices, Above Bar Street.

Sealed tenders on the printed form, endorsed "Tender for Tramway Uniforms," must be left at the Town Clerk's Office by 12 o'clock at noon on the 30th instant.

No pledge is given to accept the lowest or any tender.

R. R. LINTHORNE,
Town Clerk.

## EXCESS PASSENGERS IN TRAM CARS.

Slowly and by degrees the London County Council are winning for their tramway system some of the privileges which have for years been freely accorded tramways outside of the metropolitan area. If it were not for the serious consequences, the situation would be farcical. Here we have by far the biggest tramway undertaking in the country—and one, moreover, worked not by a dividend-seeking company but by a local authority—bound in shackles by rigid police regulations in regard to matters in which other tramway undertakings have freedom. In other parts of the country when it becomes apparent to a tramway authority that it would be advantageous to the undertaking and to the public that some local restriction should be removed or that some change should be made, say, in the structure of cars, the thing is done. If the tramway is worked by the local authority that body makes the change by its own volition. If a company runs the cars it negotiates with the local authority, and an agreement is usually possible. But in London the Commissioner of Metropolitan Police has autocratic powers, and he and his advisers refuse to make any changes in by-laws which are relics of old times when conditions were wholly different. The latest change, authority for which has been obtained only after long opposition, and which came into force last Saturday, is to allow excess passengers up to about 10 to stand in a car during inclement weather and on holidays and special occasions. This concession, granted all over the country years ago, has all along been strongly opposed by the London police authorities, just as if the cars were still drawn by horses. The ice was broken some time ago when owing to a break-down at the tramway power station the services of cars had to be restricted, and the Board of Trade granted the concession temporarily till the full services could be resumed. The question arose also in connection with the inauguration of through running with outside tramway systems which already had the power to carry excess passengers. Yet the County Council could only get over the police objection by obtaining the desired authority in their Tramways Act which became law on August 15. On the following day notices were put up in the cars announcing that on the specified occasions excess passengers up to one-third of the number for whom seats are provided on the lower deck may be carried. There will now be a chance for passengers during the busy hours getting into cars at intermediate points. For this simple boon an Act of Parliament was required! There may be some trouble at first between passengers and conductors as to what constitutes inclement weather, as a hard and fast line between good weather and bad is not easy to draw. The management of the tramways, after a little experience should get over that, and they will also have to try to harmonise the police definition and the tramway definition of inclement weather. If the authorities of Scotland Yard were more closely in touch with the needs of the users of the tramways there would be little reason to apprehend any trouble on this account.

## SELECT COMMITTEE ON MOTOR TRAFFIC.

*To the Editor of* THE TRAMWAY AND RAILWAY WORLD.

SIR,—Although I am on holidays, I cannot refrain from saying that I have read the recently issued report of the Select Committee on Motor Traffic, and must admit I am somewhat disappointed at the conclusions and recommendations arrived at. I am much afraid in view of the numerous authorities who will have a finger in the pie, so to speak, that the Committee's recommendations will add another fatuity to the existing muddle. A properly constituted Traffic Board, really desirous of meeting the convenience of the travelling public, with due regard to public safety, and—"not swayed by electoral considerations, either of a metropolitan or local character"—could, and should, be able to deal with all traffic matters. Centralised control of some sort *is* an admitted necessity. I have, with others concerned in the Metropolitan transportation business, always contended that the proper solution of the difficulties was the appointment of a Central Traffic Board—as independent of other authorities as the Water Board, for instance—and which should be possessed of large controlling powers over the different forms of locomotion, and am firmly of opinion that the only permanent and equitable solution for the adjustment of *all* conflicting interests would be the establishment of an independent Traffic Branch, instead of the proposed new branch of the Board of Trade.

Yours faithfully,
T. B. GOODYER.

Gorleston-on-Sea, August 18, 1913.

## LONDON MOTOR TRAFFIC.

THE POSITION AND OPINIONS OF MR. W. W. BEAUMONT.

In the House of Commons, a few days before the close of the Session, Mr. FRED HALL (Dulwich—U.) asked the Secretary of State for the Home Department if Mr. W. Worby Beaumont, who acted as adviser to the Commissioner of Police in regard to the construction of licensed motor vehicles, was also consulting engineer to any omnibus company running licensed vehicles in the Metropolitan police area; if so, the dates when he took up these respective positions; what were the duties he performed in regard to motor vehicles, and did these duties include the supervision of tramcar design; if Mr. Beaumont had expressed any opinion as to the advantages or disadvantages of tramways as a means of urban street transit; and, if so, whether this opinion was expressed in his capacity as adviser to the police or to the omnibus companies.

Mr. MCKENNA replied: Mr. Worby Beaumont has been adviser to the Commissioner of Police in regard to the construction of licensed motor vehicles since November, 1905. His duties, which are advisory only, do not include the supervision of tramcar or of omnibus or of cab design, but he is consulted on technical engineering points affecting the construction of cabs and omnibuses, and occasionally of tramcars. I believe that Mr. Beaumont has for many years given public expression to his personal views as to the advantages or disadvantages of various means of street transit, but these are his personal views only, and he has not been asked to express any opinion in an official capacity. Mr. Beaumont at the time of his appointment as adviser to the Commissioner of Police was, I believe, already consulting engineer to all the motor omnibus companies then plying in London, and also to various tramway undertakings in London and elsewhere.

It will be remembered that the Select Committee considered that the technical adviser to the Chief Commissioner should be an independent official.

## ROAD MAINTENANCE IN LONDON.

Serious Effect of Motor Traffic.

The Metropolitan Paving Committee have received replies from the surveyors of the Metropolitan Boroughs on the subject of strengthening the foundations of roads. The Committee had been informed that in order to withstand the greater weight and strain imposed on road foundations due to the increase of motor omnibus and other heavy mechanically propelled vehicle traffic it had been found necessary in many cases to increase the thickness of the concrete foundations. From the replies which the Committee have received from the surveyors the following interesting particulars are gathered :—

In the City the existing foundations of the main thoroughfares are not sufficiently strong to withstand the weight and strain imposed on them, and the City engineer considers that the minimum thickness of the concrete foundations should be 9in. In Bermondsey it has been found necessary to increase the thickness from 6in. to 9in., or even 12in., at considerable cost. In Fulham motor traffic has, if anything, decreased the cost of the maintenance of wood-paved roads, or even of roads remade with bituminous macadam. In Finsbury the experience is similar, but in Greenwich it is quite the reverse, for the old concrete foundations are inadequate for the greater weight of vehicles, and the increased load and speed are causing greater vibration. In Hackney the foundations are being doubled in depth, for the usual life of a road is being curtailed, even to the extent of 25 per cent. In Hammersmith increased foundations have become necessary, and the cost of constructing all classes of roads has been added to. In Hampstead the additional cost of road maintenance has been about £5,000 per annum in the last two years. In Holborn the foundations have been doubled. In Lewisham the heavy motor traffic is very materially increasing the cost of road maintenance. In St. Marylebone the foundations have been deepened in the case of wood-paved roads. Macadam roads have had to be re-coated annually. In St. Pancras many wood-paved streets have been injured, and in two cases only £3,800 has had to be spent in making new foundations. On macadam roads the omnibus traffic is terribly destructive. The borough supports the claim of the local authorities that grants should be made by the Road Board from the fund provided by the petrol tax towards the necessary expenditure. In Paddington, Poplar, and Southwark the cost of maintaining the carriage-ways has been advanced. In Westminster for new roads a deeper concrete foundation is being provided, but while the increase of motor traffic prejudicially affects macadam and perhaps, to some slight extent, asphalte roads, there has not been any increase of the cost of maintenance of wood-paved roads. In Woolwich the borough council is considering the advisability of adopting a more durable paving than water-bound macadam and tar-sprayed roads.

## LONDON THROUGH-RUNNING ARRANGEMENTS.

A Trial Run to Hampton Court.

So successful are the through-running arrangements with the Greater London municipal tramways and the Metropolitan Electric Tramways Company in the northern and north-western Middlesex districts of the metropolitan area, that a suggestion has been made for a similar agreement between the London County Council and the London United Electric Tramways Company. The suggested linking up is between the Victoria Embankment and Tooting lines, which terminate at Merton, and the Merton, Wimbledon, Kingston, and Hampton Court section of the company's system. The interchange was originally proposed by the late Sir Clifton Robinson, at whose instigation the company promoted a Bill in Parliament some years ago, to obtain compulsory running powers over the L.C.C. lines to the Embankment. The Bill, however, was rejected.

A large business traffic is exchanged between the two systems, and there is also an extensive Sunday and holiday traffic from London to Hampton Court, notwithstanding the inconvenience of having to change cars at the London County boundary. The late Sir Clifton Robinson, chairman of the company, frequently advocated through running, but it has remained for the era of motor-omnibus competition before the London authority could be induced to seriously consider the question. The motor-omnibuses also add to the risks run by tramcar passengers in changing cars, an operation that may also be regarded as leading to unnecessary obstruction of the roadway. Whether through-running arrangements will be made is at present uncertain, but a hopeful indication may be drawn from the fact that on August 14 a London car fitted with an overhead trolley was run on to the company's track at midnight and travelled to Hampton Court and back. The journey of twenty miles or so was made without a hitch, the track being adapted for bogey cars as heavy as those of the County Council. Officials of both undertakings took part in the novel run to the Thames-side pleasure resort.

A Modification of the Leyton Agreement.

Leyton Urban Council have secured a modification of the agreement with the London County Council for through running on the Lea Bridge Road route. The receipts for cars on the through route are to be pooled and divided according to the mileage run by each authority, for a period of three months from August 1 last. The proportion of mileage run by each authority is to be on the same basis as at present.

## TRAMWAY LABOUR AGITATIONS.

An Amalgamation of Unions.

The Parliamentary Committee of the Trades Union Congress have sanctioned a proposal for an amalgamation of trades unions connected with vehicular workers, and a conference to arrange details has been convened for September 24 at Manchester. The scheme affects the Amalgamated Society of Tramway and Vehicle Workers, London and Provincial Union of Licensed Vehicle Workers, National Union of Vehicle Workers, United Carters' Association, and the Carters, Lorry and Motormen's Union, and their approximate membership is 100,000. The proposal is the outcome of the London taxi cab strike, in which it was found that the success of the men was delayed by the ease with which the travelling public were able to resort to tramcars and omnibuses when the supply of taxi cabs failed. It is also proposed to form an alliance with the National Union of Railwaymen if the present scheme proves successful.

Nottingham.—Several matters affecting the Corporation tramway workers have been forwarded for the consideration of the Tramways Committee. These include a petition, signed by about 320 motormen and conductors, against the bonus system for power saving; an application for permission to wear the union badge in uniform or otherwise; and the provision of wind-screens.

Ashton-under-Lyne.—Alderman Jackson, secretary of the Tramway and Vehicle Workers' Union, accompanied a deputation of the men which on August 16 met representatives of the three tramway authorities. The men had asked for another ½d. an hour all round for drivers and conductors, and the employers had offered a farthing to the drivers and a halfpenny to the conductors, but only to men of five years' service. The employees have decided to hand in their notices this week.

Rochdale.—The tramway workers have been granted an increase of wages equivalent to a farthing per hour, the motormen to reach a maximum of 7d. per hour after five years' service, and the conductors 6½d. after five years' service. They are also to receive wages at the rate of time and a quarter for work on Christmas Day; but the committee cannot see their way to pay time and a half for all time worked over eleven hours per day. The men have decided to ask that the maximum wage should be reached after four years' service.

Dublin.—The following notice was issued on August 12 by the directors of the Tramways Company :—"It has come to the knowledge of the directors that demands prepared by Mr. James Larkin are to be sent to the board by some of the traffic employees, under the pretence that they are coming from the body of the men. As no consideration will be given to any communication coming from Mr. Larkin or his union, his agents might save themselves the trouble of sending them in." It is claimed on behalf of the Transport Union that when a strike is declared a stoppage of the service will be brought about by the withdrawal of the power house men.

Sheffield.—As he would not be able to be present at the September meeting of the City Council, Sir Wm. Clegg, chairman of the Tramways Committee, read a statement at the August meeting in regard to the men's demands about to be submitted to an arbitrator. No body of employees, he said, had better conditions than the tramwaymen, and expressed his surprise and regret at their dissatisfaction and the "unwarranted threats" their leaders had indulged in. He uttered a grave warning as to the risk of the forfeiture of their privileges the men would have run had they gone to the extremity of a strike. The generosity and goodwill of the committee had apparently been construed as weakness, and he added, "it may be that in the future the committee may have to reconsider its policy." The Tramways Committee did not want dissatisfied servants, and those who thought they were unfairly treated were at liberty to terminate their engagements; they were determined to be masters in their own house. The only criticism came from Councillor Holmshaw, who, amid some dissent, interpreted Sir William's doctrine to mean that workmen must not make any effort to improve their position.

## NEW AND PROSPECTIVE WORK.

Dublin.—The Tramways Company have decided to at once relay some of the lines which they had not intended to proceed with until next year. The reason for the decision is the greater dearth of employment in the city for casual labour.

Dunfermline.—The Dunfermline District Tramway Company have decided to carry their tramway system through Dunfermline to the western boundary of the burgh. When the Company obtained their powers it was a condition that they pay the Corporation £100 per mile in respect of the upkeep of the tramway track. As an incentive to the Company to carry out the extension the Council have agreed to reduce the payment to £60 for a period of five years.

Morecambe.—The Town Council, on August 19, agreed that the electrical engineer should prepare a scheme for the electrification of the tramways.

Stirling.—The Council have decided to consider a proposal made by Mr. George Balfour, of Messrs. Balfour, Beatty, and Co., London, to acquire the Stirling and Bridge of Allan Tramways and to apply for powers to enable them to reconstruct and electrify the lines. Mr. Balfour states that he could only carry out the scheme on condition that he was able to acquire the electricity works from the Corporation, when he would reduce the charge for domestic and public lighting.

## RAILLESS TRACTION AT RAMSBOTTOM.

The first railless trolley traction installation in Lancashire was inaugurated on August 14 at Ramsbottom, as reported in our issue of August 16. The Board of Trade inspection was made by Major Druitt and Mr. Trotter. The total distance is 3½ miles, and the through fare will be threepence. The car started from the railway station and ran to Holcombe Brook and Edenfield, the passengers also including Councillor Wilkinson (chairman of Ramsbottom Urban Council), Mr. J. B. Hamilton, Mr. Jekin (assistant consulting engineer), Mr. W. Clough (manager, Bury Tramways), Mr. C. Z. E. Stewart (manager, Rawtenstall Tramways), Mr. Clough (Clough, Smith and Co., of London, overhead contractors), Mr. E. M. Munroe (of the R.E.T. Construction Company, Limited), and Mr. J. Wild (manager of the Ramsbottom Tramways). The last-named was the driver of the first car. The inspecting officers found that the system generally was satisfactory, and gave permission for immediate working of two cars. Two other cars were expected to arrive before the end of the month, when a more frequent service than a half-hourly one was expected to be introduced. Each car has the R.E.T. Construction Company's double trolley of the under-running type, which allows the vehicle a radius of 16 feet from the centre of the trolley wires, of which there are four, in order that the car may be driven over the whole of the roadway. The car is driven by two 20 horse-power motors, and as it is driven only from one end at each of the three termini the overhead wires are in the form of part of a circle to enable the cars to be turned. The maximum weight of a car when loaded is five tons. Messrs. Siemens supplied the electrical equipment, Messrs. Brown, of Huddersfield, constructed the chasses, and the bodies were built by Milnes Voss and Co., Birkenhead, the whole of the work being under the supervision of the R.E.T. Construction Company. The current is supplied by the Lancashire Electric Power Company, at a pressure of 10,000 volts, which is converted to 500 volts in a small sub-station adjoining the new car depôt in Stubbins Lane. The car shed will accommodate six cars, and there are also repair shops, store rooms, mess rooms, and offices.

## CAR REPAIR COSTS.

Some time ago Mr. N. J. Young, general manager of the Newport Corporation tramways department, obtained information in reference to the cost of car repairs on various tramways, and the statement is included as an appendix to his annual report. We give below the figures for the last two years :—

| Name of Town. | Total No. of Cars. | | Total cost of car repairs and maintenance per car per annum. | |
|---|---|---|---|---|
| | 1910-11 | 1911-12 | 1910-11 | 1911-12 |
| Aberdeen ... ... (14) ... | 71 | 71 | £35 | £35 |
| Belfast ... ... (8) ... | 243 | 250 | 61 | 61 |
| Birkenhead ... ... (12) ... | 59 | 59 | 73 | 79 |
| Birmingham ... ... (6) ... | 300 | 460 | 68 | 54 |
| Blackburn ... ... (14) ... | 61 | 61 | 61 | 69 |
| Bolton ... ... (13) ... | 106 | 106 | 85 | 113 |
| Bradford ... ... (15) ... | 237 | 240 | 81 | 88 |
| Burnley ... ... ... (12) ... | 57 | 57 | 64 | 67 |
| Cardiff ... ... ... (9) ... | 130 | 130 | 46 | 46 |
| Croydon ... ... ... (11) ... | 70 | 70 | 78 | 85 |

| Liverpool ... ... (15) ... | 558 | 572 | 78 | 78 |
| Manchester ... ... (12) ... | 600 | 617 | 96 | 85 |
| Newcastle-upon-Tyne... (12) ... | 190 | 190 | 50 | 65 to 70 |
| Newport ... ... ... (10) ... | 44 | 44 | 67 | 85 |
| ,, 1912-1913 ... ... | | 44 | | 94 |
| Oldham .. ... ... (11) ... | 80 | 92 | 97 | 83 |
| Portsmouth ... ... (12) ... | 100 | 100 | 48 | 46 |
| Preston ... ... (9) ... | 30 | 30 | 94 | 110 |
| Rochdale ... ... (11) ... | 59 | 59 | 57 | 70 |
| Salford ... ... ... (12) ... | 200 | 200 | 68 | 70 |
| Sheffield ... ... ... (14) ... | 264 | 269 | 88 | 92 |
| Sunderland ... ... (13) ... | 70 | 70 | 35 | 39 |
| West Ham ... ... ... (9) ... | 118 | 118 | 69 | 77 |
| Wigan ... ... ... (11) ... | 67 | 67 | 69 | 69 |
| Wolverhampton ... (13) ... | 49 | 49 | 47 | 51 |

The figures in brackets are the number of years Electric Cars have been running.

**First-Class Tramcars.**—The Manchester press appears to be greatly exercised over the question whether Manchester should imitate Liverpool's example and introduce first-class tramway cars. A petition in favour of them has been presented to the Tramways Committee, and will be considered shortly. There seems to be a feeling, however, that the use of such cars would create "an invidious distinction among tramway travellers which would meet with very serious opposition." The ridiculous suggestion is made that it would tend to snobbishness. A member of the Tramways Committee recently said that the policy of the Committee is very much against any distinctive service being adopted; cheaper rides were what they aimed at. People who wanted privileges in riding should pay for them and utilise taxi cabs. To the casual observer it appears that the only phase of the matter with which councillors need concern themselves is covered by the question, Would the innovation pay? If there is a demand for the special service and it appears likely to prove remunerative the Council's course of action is clear.

## MISCELLANEOUS NEWS AND NOTES.

**Barking Council** have arranged with the East Ham Tramways Committee for a supply of current for the Barking tramways.

**Alteration of Halfpenny Stages at Aberdeen.**—While retaining the maximum charge of 1d. from the centre of the city to any terminus on any one car the City Council have lengthened the halfpenny stages from an average distance of 840 yards to 850 yards.

**Ripley to Nottingham Tramways.**—By the opening on August 15 of the Ripley to Crosshill section of the Nottingham to Ripley tramways, the undertaking was inaugurated throughout its whole length. Lieut.-Colonel Druitt, of the Board of Trade, was again the inspecting officer.

**New Cars and Wire Mats for Dundee.**—The Tramways Committee have authorised the manager, Mr. Peter Fisher, to obtain tenders for four additional cars, in view of the extension of the tramways to Broughty Ferry, and to equip all the cars on the system with wire mats, at a cost of £3 18s. per car.

**Rail and Paving Renewals at Brighton.**—The Tramways Committee has agreed to a proposal made by Mr. W. Marsh, the tramways engineer, for the renewal of a portion of the rails and wood paving in London Road early next year, at an estimated cost of £5,000, exclusive of the cost of an 18-inch margin.

**Route Numbers.**—Progress is being made with the work of fixing route numbers, with the necessary equipment for illumination at night, on the electric cars of the London County Council and the Liverpool Corporation. In London the back portion of the illuminated boxes is being utilised as advertisement spaces.

**Dublin Council and the Tramway Company.**—Without discussion the Dublin Corporation on August 18 adopted a resolution by Councillor Partridge, drawn up in best debating society style, instructing the Law Agent and the Town Clerk to report on the steps to be taken in order to acquire the tramways undertaking.

**Greenock Tramways and Municipal Ownership.**—Councillor Mitchell has given notice to move at the next meeting of Greenock Corporation that the Town Clerk give due and further notice to the Greenock and Port-Glasgow Tramways Company that the Corporation have decided to exercise the option they are entitled to in terms of the lease to terminate such lease on the first break, namely, May 15, 1914.

**"Railless" Proposals at Aberdeen.**—The directors of the Aberdeen Suburban Tramways Company have had under consideration the question of extending their operations by the working of trackless cars or other mechanically propelled vehicles, and they are satisfied that this course would not only be profitable in itself but would attract fresh traffic. A resolution to that effect will be submitted at the half-yearly meeting.

**Motor Omnibuses for Crewe.**—At a recent meeting of the Crewe Town Council it was decided to promote a Bill in Parliament to enable the Corporation to run motor omnibuses within the borough and to and from Crewe, Nantwich, Willaston, Haslington, and Sandbach. Some years ago a private company obtained an order to construct light railways in Crewe, but subsequent opposition by the Corporation led to the abandonment of the project. A suggestion was made later that the municipality itself should provide tramways, but this was vetoed at a town's meeting. The town is now served only by horse omnibuses.

**Excess Number of Passengers in London Cars.**—The London County Council (Tramways and Improvements) Act, 1913, received the Royal Assent on August 15, and on the following day a notice was posted in the cars calling the attention of passengers to Clause 27 of that Act, which reads as follows :—"Notwithstanding anything to the contrary contained in any Act, Order, By-law, or Regulation, the Council may, during inclement weather or on Sundays, or Bank or other public holidays, throughout the day, or on Saturdays after twelve o'clock noon, or (with the consent of the Commissioner of Police of the Metropolis) on special occasions, carry inside any carriage used by them on any tramways, an additional number of passengers not exceeding one-third of the number of inside passengers which such carriage is licensed to contain."

**A Compliment to Leeds Tramway Employees.**—A blind passholder writes to a Leeds newspaper thus :—"For some years I have been afflicted with blindness and have had the privilege of a free pass allowed by the Corporation, and I am expressing the sentiments of many of my blind friends when I say that the civility and kindness of our conductors might be equalled but not excelled. As a rider for many years, visiting almost every town and city from Trent to Tweed, I can testify that the Leeds conductors set up a standard for manners, kindness and courtesy which would do credit to many others to follow. I would like Mr. Burgess to have to work some of the heavy short-staged routes and take some of the insults and dirty remarks that are given to the conductors on many occasions when making an effort to get through the almost impossible task of taking the fares."

**New St. Petersburg Car Depots.**—When the first series of tramways was constructed in St. Petersburg, new depôts were not built. The old horse car depots were used. It was quite impossible to effect many of the repairs that became necessary, and cars more than slightly damaged had to be sent to the factories. But with the second series of tramways new car sheds are being built, the largest of which is the Rozhdestvenski depôt which occupies a surface of 102,900 square feet. The car sheds will accommodate 200 cars so disposed as to be examined on all sides with pits between rails for their inspection from below. The buildings are mainly ferro-concrete. Administrative offices three to six stories high are being added. This establishment is expected to be opened in November, when the second series of tramways is to

Digitized by Google

be inaugurated. A second depôt, occupying 72,030 square feet is under construction in Bulfovoi Ulitz for 120 cars, where lighter supplementary work will be effected. The Rozhdestvenski car shed alone is estimated to cost £106,250. Five hundred workmen are at present engaged on it.

**Important Proposal Rejected at Glasgow.**—Consideration was given by the City Council on August 14 to a recommendation by the Tramways Committee that application be made for Parliamentary powers to enable them to remove obstructions from the tramway lines, and where it could be shown that the obstruction was due "to the overloading of the vehicle or to negligence in the construction or maintenance thereof," for powers to charge for the cost of the removal and the loss occasioned by the interruption. On a motion to disapprove of the recommendation being proposed and seconded, Bailie Alston said the committee were only seeking powers to recoup themselves for having to bring the apparatus for removing obstructions from the depôt. It was in the interests of other users of the streets that obstructions should be removed as speedily as possible. The minute was disapproved by a large majority.

## CONTRACTS AND ORDERS.

**The Electrical Company's** tender for 70 tramcar watt-hour meters, mounted on special spring frames, has been accepted by Burnley Corporation.

**Wm. Pollitt and Co.** have obtained a contract for the laying of cable conduits in connection with the new generating station of the Bolton Corporation.

**Tudor Accumulator Company, Limited,** have obtained a contract for the repair and maintenance of the battery at the Heywood Corporation electricity works.

**Newport Council** have accepted the tender of Mr. Bertram Thomas for the supply of switchgear at £168, and of Mr R. W. Moon for the erection of a switch and motor house, at £500.

**Sunderland Council** have placed contracts as follow:—Hadfield's Steel Foundry Company, relaying a manganese railway and tramway crossing; Tudor Accumulator Company, Limited, welding 500 tramway rail joints; British Insulated and Helsby Cables, Limited, and I.R. and G.P. Company, cables; Ferranti, Limited, meters.

**Chesterfield Council** have placed contracts as appended:—Marsden Bros., sub-station, Whittington Moor, £205; Chas. Ross, Limited, girders for switch gallery, £44; B.I. and Helsby Cables, Limited, 1,200 yards low-tension triple-concentric armoured cable, £204; Brush Electrical Engineering Company, Limited, two trailer car bodies, £80 each.

## PERSONAL.

**Mr. W. E. Read,** of the Burton Corporation Tramways, has had his salary increased from £130 to £140 per annum.

**Mr. Robert Hammond** leaves England on August 30 on a visit to South Africa, sailing on the "Edinburgh Castle."

**Mr. V. Hutchinson,** formerly of Hobart, has been appointed electrical engineer to the Brunswick Municipality (Vic.).

**Mr. G. B. Wheeler,** of Southport electricity works, has been appointed chief assistant engineer at the Hamilton electricity works.

**Mr. H. Greaves** has been appointed buyer to Ferranti, Limited, in the place of Mr. J. Robinson, who has resigned owing to ill-health.

**Mr. G. G. Deeley** has been appointed senior charge engineer at Southport electricity works, and Mr. S. Pendlebury as assistant mains superintendent.

**Mr. A. Lees,** a motorman in the Ashton-under-Lyne Corporation tramways department, has been appointed cash clerk and ticket inspector out of a number of applicants.

**Mr. Hamylton Rigg** has resigned his position as sales engineer to the Electrical Power Storage Company, to take up similar duties with Edison Accumulators, Limited, of 49, Old Bond Street.

**Mr. George Herman Anger,** managing director of the Anger Manufacturing and Supply Company, of Bank Chambers, Preston, will sail for New York on October 4 by the "Lusitania." The Anger Company are the manufacturers of the Anger improved automatic brake adjuster, a device which is now in use on 129 tramways representing nearly every country of the world. Mr. Anger goes to the United States to attend the convention and exhibition of the Electric Railway Association of the United States, which will be held at Atlantic City from October 11 to 19. The Anger brake adjuster will be shown there by the Ackley Brake and Supply Company of Church Street, New York City, the sole manufacturers and selling agents for the Anger improved automatic brake adjuster in U.S.A., Cuba, Porto Rico, Mexico, Central America, Venezuela, the Philippine Islands, and the West Indies. After the convention Mr. Anger will visit various tramways in Canada, making his headquarters at the company's Toronto office, and will return to England about November 1.

**Mr. A. T. Lambert,** general manager and electrical engineer, Maidstone Corporation tramways, was made the subject of some complimentary remarks at the opening of the new offices at the Barming depôt on August 15. Councillor Lyle, chairman of the Tramways Committee, in the course of remarks made in calling upon the Mayor to open the new offices, observed that the offices had already paid for themselves in that the manager had, since their erection, always been on the spot, and able to direct the men of the depôt in their work. It must have been very detrimental to the undertaking to have the manager in Mill Street, right away from the place where the repairs to the cars were being executed. Mr. Lambert worked hard to make the tramways a success. There were managers who could not tell the men in the workshop what to do, but Mr. Lambert was not a manager of that stamp. He not only knew how to do the work but showed the men how to do it. The Mayor (Councillor Potter) agreed that in Mr. Lambert they had a clever engineer, and one who thoroughly understood his work. The Council wanted him, with the chairman of the committee, to be master of the whole concern.

## FINANCIAL REPORTS AND MEETINGS.

**Oldham, Ashton, and Hyde Electric Tramway Company.**—The directors have declared an interim dividend at the rate of 5 per cent. per annum (5s. per share) on the ordinary shares for the past half-year.

**Bombay Electric Supply and Tramways Company, Limited.**—In the reference to the annual meeting of the Bombay Electric Supply and Tramways Company in our issue of August 2, the rate of dividend was incorrectly stated. The dividend for the year was at the rate of 5 per cent., free of income-tax.

**The British Electric Traction Company.**—The receipts of all the associated companies of the British Electric Traction Company for the week ended August 15, 1913, amounted to £53,540. Upon such of the lines as were working both last year and this year the receipts show an increase of £2,743 upon the week.

**Aberdeen Suburban Tramways.**—The report of the Aberdeen Suburban Tramways Company for the half-year to July 31 states that the profit earned amounted to £1,505, and there is a balance of £3,792 at the credit of profit and loss account. The directors recommend adding £2,000 to the renewal and depreciation account, which will then stand at £12,000, payment of a dividend at the rate of 2½ per cent. for the past year on the paid-up capital, and carrying forward £969.

**Sunderland Corporation Tramways.**—For the year 1912-13 the total traffic revenue was £68,507, as against £67,871 in 1912, and the net balance was £13,446, as against £13,063. The traffic receipts had risen from £17,578 in 1898 to £68,507, this figure having only once been exceeded—in 1908, when the receipts were £68,797. After paying interest on capital, £7,228, and income-tax, £476, there was a balance of £22,408 to carry to the appropriation account. It was proposed to apply £10,366 to the repayment of loans, £7,218 to reserve and renewals fund, £400 to Wheat Sheaf offices, £352 to capital work, £476 to income-tax, and £5,000 for the relief of the rates, this latter contribution making £42,027 given for this purpose since the Corporation took the system over. The amount in the reserves, renewals, and compensation fund was £31,883. The average working expenses per car mile, including cost of power, amounted to 6.33d.

**An Opening for Electrification.**—At the quarterly meeting of the Wicklow County Council, the County Surveyor reported having carried out the annual inspection of the Dublin and Blessington Steam Tramway. In giving the financial results for the past year he said the increased receipts obtained by giving a better service, when there was an opening for such, were altogether eaten up by the fuel bill, and when the cost at 3s. 9d. per tram mile of the electrically-worked Lucan Tramway was compared with 19s. 6d. per mile of the Blessington line, it was easy to understand why the counties had to contribute. There was nothing for it but to try to have some change made on the line, and it would be in the Council's favour if the line were worked by electricity. Mr. Walsh asked: Would the County Council, as the largest guarantors, enforce the sale of the line to any company willing to take it up? The Surveyor: I cannot tell you. It is wrapped up in the law. Mr. McCarroll said the matter was in the hands of a committee who were doing their best in the interests of the Council. The report was referred to this committee.

**Wigan and the Rating Question.**—In his report for the year ended March 31, Mr. F. Buckley, the traffic manager of the Wigan Corporation tramways, says:—"The returns have been of a highly satisfactory character, inasmuch as a profit of £1,178 has accrued, as against a deficit of £4,089 during the year 1911-12. The receipts amounted to £71,268, as compared with £66,328 for the previous year, an increase of £4,939. The average receipts per car mile amounted to 11.80d., as against 11d. during last year, an increase of .80d. per car mile. The consumption of electrical energy for traction purposes during the year again shows a decrease. The total number of units consumed was 2,132,384, or 1.47 units per car mile. The corresponding figures for the previous year were 2,190,122 units and 1.51 units per car mile—a decrease this year of 57,738 units, or 2.7 per cent." Passengers totalled 13,018,833, an increase of 906,500. Unfortunately, it appeared from the remarks made by Alderman Ashton in moving the adoption of the report, that the reduction in the rating accounted for nearly £1,000. Speaking before the decision of the House of Lords was announced in the matter of the rating appeal, Tottenham Council *v.* the Metropolitan Tramways Company, he said he did not think they would ever be called upon to pay that. One never knew what would happen. One court decided one thing, and a second court another. He thought the committee had done wisely in putting that balance in hand to the reserve fund. Councillor Bradshaw in seconding the motion for the adoption of the report, said it was remarkable that the difference in the total increase of revenue had taken place in the last six months, since the change in the management.—Hindley Council on August 15, in consequence of the House of Lords' decision that tramways were rateable at full, decided to make demands

Digitized by Google

against the South Lancashire Tramways and the Wigan Corporation Tramways for the balances of rates for June, 1912, and June, 1913.

**Newport Corporation Tramways.**—The report of Messrs. N. J. Young, general manager, and A. Nichols Moore, borough electrical engineer, for the year ended March 31, 1913, is summarised below :—

| | 1912-13. £ s. d. | 1911-12. £ s. d. |
|---|---|---|
| Traffic receipts | 37,555 4 7 | 36,360 12 6 |
| Other receipts | 994 11 6 | 821 9 11 |
| Total income | 38,549 16 1 | 37,182 2 5 |
| Working expenses | 31,670 13 7 | 26,528 8 1 |
| Balance, being gross profit | 6,879 2 6 | 10,653 14 4 |
| Add accrued interest | 808 9 10 | 904 9 2 |
| | 7,687 12 4 | 11,558 3 6 |

Out of which the following charges have been met :—

| | | |
|---|---|---|
| Interest on capital | 5,817 14 6 | 6,144 16 10 |
| Sinking fund | 4,196 16 11 | 4,074 12 1 |
| | 10,014 11 5 | 10,219 8 11 |
| Leaving a balance of | — | 1 338 14 7 |
| Leaving a deficiency of | 2,236 19 1 | — |

The receipts show an increase of £1,367, which was obtained in spite of the curtailment of the service during the coal strike. Although 46,000 additional car miles were run, making a total of 668,067, the cost of energy decreased by about £626. The consumption of energy per car mile is now 1.28 units, as compared with 1.51 in the previous year. Repairs of the permanent way and reconstruction of the tramcars are accountable for an increased expenditure. During the year a good deal of No. 0 trolley wire has been replaced by No. 00 wire, and automatic points have been installed, with satisfactory results. The average total revenue per car mile is 9.55d., and the expenses 7.85d. The Corporation now has 44 cars.

## WEEKLY TRAFFIC RETURNS.

The official traffic returns of 67 of the principal undertakings of the United Kingdom for the week ended August 16 amounted to £248,668, or £13,835 more than in the corresponding week last year, while the track mileage was 2,712, or 52 more than for the corresponding week. The receipts were at the rate of £91 13s. 10d. per track mile, an increase of £3 8s. 2d. per mile as compared with last year.

(*Continued from page* 174.)

### RAMSBOTTOM RAILLESS ELECTRIC TRACTION.

Tenders are invited for the supply of a Tower Wagon, height when lowered 13 feet 6 inches, and when extended 21 feet.

Tenders, giving particulars as to height and as to class of wood, to be forwarded to the undersigned by 9 a.m. on Thursday, the 28th instant.

JOHN W. BARLOW,
Clerk.

Council Offices, Ramsbottom.

### CITY OF MELBOURNE, AUSTRALIA.

SUPPLY OF ELECTRICITY RECORDING METERS AND MAXIMUM DEMAND INDICATORS.

Tenders are invited for the supply of Electricity Recording Meters and Maximum Demand Indicators.

Copies of specification, conditions of contract, and form of tender can be obtained on application to the undersigned.

Applications must be accompanied by a deposit of 5s., which will be returned on receipt of a *bonâ fide* tender.

Tenders should be sent to the undersigned, endorsed "Tenders for Electricity Recording Meters," and must be received by them not later than noon of Tuesday, September 9, 1913.

The Council reserves to itself the right, but does not bind itself, to accept the whole or any portion of any tender.

McILWRAITH, McEACHARN AND CO. PPTY., LTD.,
Billiter Square Buildings, London, E.C.,
Agents for the Melbourne City Council.

### BOROUGH OF ROYAL TUNBRIDGE WELLS.

ELECTRIC SUPPLY DEPARTMENT.

The Corporation is prepared to receive tenders for the supply and delivery of High and Low Tension Cables during the ensuing twelve months.

Specifications can be obtained from the Borough Electrical Engineer, Stanley Road, Tunbridge Wells.

The Corporation does not bind itself to accept the lowest or any tender.

Tenders, sealed and endorsed "Tender for Cables," should be addressed to the Town Clerk, Town Hall, Tunbridge Wells, and delivered not later than the 13th September, 1913.

By order, W. C. CRIPPS,
Town Clerk.

Town Hall, Tunbridge Wells,
August 15, 1913.

## COPPER AND ALUMINIUM MARKET.

August 22, 1913.

Messrs. Henry R. Merton and Co., Ltd., 2, Metal Exchange Buildings, Leadenhall Avenue, E.C., supply the following quotations of prices per ton :—

| | Friday, August 22. £ s. d. | Last week. £ s. d. | A Year Ago. £ s. d. |
|---|---|---|---|
| Standard Copper (cash) | 68 10 0 | 69 15 0 | 79 8 0 |
| ,, ,, (three months) | 68 10 0 | 69 15 0 | 79 7 6 |
| Electrolytic Copper—bars or ingots | 72 10 0 | 72 15 0 | 81 10 0 |
| Aluminium—bars or ingots | 86 10 0 | 86 10 0 | 77 0 0 |

## COAL MARKET.

August 22, 1913.

Messrs. Locket and Judkins, of 3, Fenchurch Avenue, E.C., report as follows :—

THE

# Tramway & Railway World

Vol. XXXIV. No. 11. ] LONDON, SATURDAY, AUGUST 30, 1913. [ Established in 1892.

ANNUAL SUBSCRIPTION (Postage Prepaid)—In the United Kingdom, 25s.; for all places abroad, 30s.

Including sixty-four issues, of which twelve are large illustrated numbers, printed on fine art paper.

## NOTICES.

**All Communications and Advertisements for next Saturday's issue should be received not later than 3 p.m. on Friday.**

**Advertisements for the next issue of which proof is desired should reach us by the second post on Wednesday.**

**The Editorial and Publishing Offices of "The Tramway and Railway World" are at Amberley House, Norfolk Street, London, W.C.**

**Telegrams: "TRAMIGRO, LONDON."**
**Telephone: No. 2948 GERRARD.**

# WEEKLY LIST OF TENDERS INVITED.

### CITY OF CARDIFF.

The Cardiff Corporation invite tenders for the supply, delivery, and erection of the following plant at their Roath Power Station:

1. A 2,000 kw. Turbine Alternator with Surface-Condensing Plant and Auxiliaries.
2. A 700 kw. Rotary Converter.
3. Boiler House Plant in three Sections. Tenders will be considered for either Section, but not for a portion only of a Section.

Section (a). Water-Tube Boilers, Superheaters, Stokers, etc.
Section (b). Turbine-Driven Feed Pump and Heater.
Section (c). Fuel Economiser.

Specification and forms of tender may be obtained from Mr. Arthur Ellis, City Electrical Engineer and Manager, Central Offices, The Hayes, Cardiff, on payment of a deposit fee of one guinea for either of the three specifications, which sum will be returned on receipt of a *bonâ-fide* tender. Further copies may be had if desired at a charge of 5s. 0d. per copy, which will not be refunded.

Sealed tenders, endorsed "Electrical Extensions, Section —," to be delivered to the undersigned not later than noon on Friday, September 12, 1913.

J. L. WHEATLEY,
Town Clerk.

City Hall, Cardiff,
August, 1913.

### URBAN DISTRICT COUNCIL OF DARTFORD.

EXTENSION OF ELECTRICITY WORKS.

The Council hereby invite tenders for the supply, delivery, and erection of the following plant at the Electricity Works, Dartford, viz.:—

(*a*) Water-tube Boiler, Economiser, Fan, Steel Chimney, and Accessories.
(*b*) Inverted Rotaries, Transformers, Switchboard, and Cabling.

Firms tendering are at liberty to tender for either section, but not for part of a section.

Copies of the specification and form of tender may be obtained from the undersigned on depositing a cheque for two guineas, which sum will be returned on receipt of a *bonâ-fide* tender.

Further information can be obtained on application to Mr. J. D. Pember, the Electrical Engineer, at the Electricity Works, Dartford.

Tenders, sealed and endorsed "Tender for Extensions at Electricity Works." to be addressed to me and delivered by 12 o'clock noon, on Tuesday, September 16 next.

The Council do not bind themselves to accept the lowest or any tender.

W. KAY,
Clerk to the Council.

Council Offices, Dartford,
August 26, 1913.

### EAST INDIAN RAILWAY.

The East Indian Railway Company is prepared to receive tenders for the supply and delivery of:—

Steel Bull-Headed Rails and Fishplates,

as per specification, to be seen at the Company's Offices.

Tenders are to be sent to the undersigned, marked "Tender for Rails, etc.," not later than 11 o'clock a.m. on Wednesday, the 10th day of September, proximo.

The Company reserves to itself the right to divide the order, also to decline any tender without assigning a reason, and does not bind itself to accept the lowest or any tender.

For each specification a fee of £1 1s. is charged, which cannot, under any circumstances, be returned.

By order, C. W. YOUNG,
Secretary.

Nicholas Lane, London, E.C.,
August 28, 1913.

### LONDON—INDIA OFFICE.

The Secretary of State for India in Council is prepared to receive tenders from such persons as may be willing to supply:—

Rails and Fishplates.

The conditions of contract may be obtained on application to the Director-General of Stores, India Office, Whitehall, S.W., and tenders are to be delivered at that Office by 2 o'clock p.m. on Thursday, September 4, 1913, after which time no tender will be received.

H. J. W. FRY,
Director-General of Stores.

India Office, Whitehall,
August 28, 1913.

### CITY OF MELBOURNE, AUSTRALIA.

SUPPLY OF THREE-PHASE TRANSFORMERS.

Tenders are invited for the supply of Three 250 k.v.a. Three-phase Transformers.

Tender forms, specification, etc., can be obtained on application to the undersigned.

Such application must be accompanied by a deposit of 5s., which will be returned on receipt of a *bonâ-fide* tender.

Tenders to be sent to the undersigned, endorsed "Tenders for Transformers," and must be received by them not later than noon of Tuesday, September 16, 1913.

The Council reserves to itself the right, but does not bind itself, to accept the whole or any portion of any tender.

McILWRAITH, McEACHARN AND CO. PPTY., LTD.,
Billiter Square Buildings, London, E.C.,
Agents for the Melbourne City Council.

### VICTORIAN STATE RAILWAYS.

The Agent-General for Victoria, Australia, invites alternative tenders for the supply and delivery f.o.b. port of shipment and c.i.f. Port of Melbourne, fully inclusive of Australian Customs duties, etc., of the following Rails and Fishplates:—

Contract No. 25,005.—Approximately 27,079 Tons of 80lb. Steel Rails.
Contract No. 25,005.—Approximately 2,215 Tons of Steel Fishplates for 80lb. Steel Rails.

Specifications, conditions of contract, and forms of tender may be obtained by *bonâ fide* tenderers at the offices of the Consulting Engineers, John Coates and Co., Limited, 25, Victoria Street, Westminster, London, S.W.

Tenders must be delivered to the Agent-General for Victoria, Melbourne Place, Strand, London, W.C., not later than 11 a.m. on Wednesday, October 8.

A preliminary deposit equal to ninepence for each and every ton of rails and fishplates must accompany each tender.

The Government of Victoria does not bind itself to accept the lowest or any tender.

## POSITIONS VACANT.

### CAR DEPOT FOREMAN.

Wanted, for a Colonial Municipal Electric Tramway, a thoroughly competent working Car Depôt Foreman, to take charge of the repair and maintenance of rolling stock and track. One having experience with petrol motor vehicles preferred. For full particulars apply to "B. J.," care Davies and Co., Advertising Agents, Finch Lane, Cornhill.

### TORQUAY TRAMWAYS COMPANY, LTD.

PLATELAYER.

Applications are invited for the above position. Candidates must have experience in maintenance work, and must be able to, or willing to learn to, drive a car when required.

Applications, stating experience and wages required, together with copies of testimonials, to be forwarded to the undersigned.

H. Holliday,
Engineer and Manager.

Car Sheds, Torquay.

### TRAFFIC SUPERINTENDENT.

Traffic Superintendent. Competent man, unmarried, required to undertake duties of chief inspector for an Indian Tramway Company. Commencing salary £200 per annum, with quarters or an allowance in lieu thereof. Three years' agreement. Second-class passage paid. Address, with full particulars, to C. L., c/o Street's, 30, Cornhill, E.C.

## FOR SALE.

For Sale.—3,500 kw. Reciprocating Engine and Generator, complete with condenser and pump, now driving the L.C.C. tramway system. Can be seen running. Full particulars apply Geo. Cohen, Sons and Co., 600, Commercial Road, London, E.

## WANTED.

Copies of The Tramway and Railway World for September, 1906, October, 1907, and October, 1908. Apply to the Publishers, Amberley House, Norfolk Street, Strand, London, W.C.

**POLE PAINTS**

which keep their colour and prevent rust. Kearsley's ready-mixed Pole Paints are used by important Tramway Companies the world over, and give entirely satisfactory results under extreme climatic conditions.

## THE RECEPTION OF THE MOTOR TRAFFIC REPORT.

It is not a matter for surprise to find that outside of traffic circles the reception accorded to the report of the Select Committee on power-driven vehicles in London has for the most part followed party lines. This adherence to party detracts from the value of the criticism bestowed upon the Committee's recommendations. In one or two cases the Moderate organs have eschewed partisanship and advocated the carrying-out of the recommendation made in 1905 by the Royal Commission on London traffic in favour of the creation of a Traffic Board for London. This recommendation also holds the field among the traffic experts of the Metropolis, if the views of one of them published in our columns last week may be taken as a criterion. The same view is held by the London General Omnibus management, who, however, are apparently willing to see the direct control of traffic placed in the hands of the new Traffic Branch of the Board of Trade which the Report of the Select Committee recommends should be set up for the purpose of advising Parliament in all Metropolitan traffic matters. Under the report of the Royal Commission the Traffic Board is to be composed of traffic experts, but the Board which the Select Committee desires to see brought into existence is seemingly only to have expert advice in matters connected with the design of mechanical public carriages. A vast amount of trouble would be averted if the Traffic Branch of the Board of Trade were to be constituted the sole authority instead of acting as a court of appeal for borough councils and transportation companies against the decrees of the County Councils of London, Middlesex, Surrey, and Kent. There is no guarantee that the action of the County Councils in traffic matters would be on uniform lines, and consequently not only delay but confusion would be created. The members of the Select Committee deserve praise for arriving at a unanimous report, but the circumstance that they are either past or present members of County Councils or provincial corporations appears to have led them to lose sight of the unique traffic conditions of London in a desire to remodel provincial conditions to suit the needs of the Metropolis. This shortcoming was avoided by the Royal Commission. Nobody ventures to assert that the police of the capital should be subject to the control of the several County Councils, instead of that of the Government, and in the same way the management of London traffic, both above and below ground, requires to be vested in a body responsible only to the Government of the day. The interest which is shown in the problem has been manifested in numerous articles in provincial journals, and at least one tramway chairman in the person of Ald. Fred Smith, of Liverpool, has made a contribution to the discussion. We are unable to find any grounds, however, upon which approval can be given to his suggestion that the new authority should be formed from among the chairmen of tramway committees and companies throughout Great Britain, adding the chairman of the Royal Automobile Club. If the latter is to be included the Automobile Association and Motor Union, which bodies have by far the largest membership, would rightly put forward a claim. London traffic authorities, however, will agree with Ald. Smith that they should be freed from fussy police interference, which, he states, can inconvenience great numbers of citizens and cause great loss by unwise dictation at a crush time of traffic. London has in addition to suffer from police opposition to tramway proposals submitted to Parliament.

## ALL NIGHT SERVICE AT MANCHESTER.

Of late years demands have arisen both at Glasgow and Manchester for an all night service of cars, but not until the present year have the management of the third largest tramway undertaking in the United Kingdom been able to obtain anything like a clear indication of the need for such a service. On more than one occasion invitations have been given to the public to afford the department the desired information, but hitherto the response had not been sufficient to warrant the introduction of anything approaching the hourly service which is to be instituted between half an hour after midnight and four o'clock on week mornings only before the end of next week. The information that has led the Tramway Committee to make their recommendation to the City Council with regard to the eight routes suggested by the manager has come from night workers themselves in the form of a memorial. The signatures numbered just over five thousand five hundred, and the would-be passengers have been met by Mr. McElroy in an exceedingly handsome manner. The report gives no information as to the probable financial results. This, indeed, is a matter upon which it is difficult to make a forecast until the facilities have become sufficiently known to bring the traffic up to its maximum. It will then probably be found that in addition to the patronage of night workers accessions will be gained to a small extent from others whom the service will induce to remain late in the city for purposes of pleasure or business. Probably also the newspaper and postal employees will very soon be asking for late cars on Sundays, for the majority of the former class are engaged at work on that night instead of on Saturday. If Manchester is without a Sunday morning delivery of letters, the postal workers will be found supporting a

Digitized by Google

request for late Sunday cars. As at present framed, the service will probably be found to have been given on too liberal a scale, but adjustments can be made if required without detracting from the utility of the facilities. Apparently Mr. McElroy's time table provides more completely for night workers than is the case in London, if the size and population of the two cities are compared. Eight routes in Manchester are to be given an hourly service, while in London ten routes are provided with cars running every twenty-five minutes on the busiest lines, but a number of the Metropolitan services extend only to half-way points. One consideration in favour of the Manchester innovation is that ordinary fares are to be charged, while in the case of London workmen's fares are charged, namely, a penny for a single journey and twopence return. Thus the London all night traffic is included in the general workmen's services, upon which a loss of some £70,000 per annum is incurred. The Manchester Committee's resolve to charge full fares will render their experiment of real interest to other large undertakings, and another interesting feature of it is that the department's motor omnibuses are to be utilised when the more important repairs and reconstructions of tramway track have to be undertaken.

## EMPLOYEES' DEMANDS.

Partial Strike in Dublin.

A number of the Dublin tramway employees went on strike on Tuesday, leaving several cars in the streets. The trouble came about with dramatic suddenness, and the local authorities, as a matter of precaution, had secured military aid in reserve to reinforce the police. After a short stoppage, a temporary service was established by the officials of the company. A number of men who left their cars on the streets were given into custody by the manager of the Tramway Company.

The Tramway Company issued the following statement in regard to the strike:—"Shortly before ten o'clock this morning some of the company's cars were deserted by the men in charge of them, who left them standing in the streets. These cars were promptly cleared off, and traffic was continued with a slightly reduced service. The company regrets the inconvenience to the public, which will be of short duration. The cars, however, will not be run after dark this evening."

Seven motormen and conductors who were arrested for abandoning their cars and so obstructing the line were subsequently charged at the police court and remanded on bail. It would appear that the employees were themselves ignorant of the intended strike until they had taken up their duties. An intimidatory method was used by the representatives of the would-be labour dictator of Dublin to call out the men. His emissaries met the cars, and held out red hand badges. The strike leaders are trying to foment strife, but from the reports of their speeches it is impossible to gain any idea of what the demands of the men really are. The strike leader, Larkin, for example, criticises all with a glib volubility, but says never a word as to what grievances the men may have. There have been meetings of the men, and though statements have been issued as to large majorities having voted for an immediate strike, these reports are invariably subsequently contradicted. Nevertheless the authorities have prepared for emergencies, and extra constabulary have been ordered to Dublin. Mr. Larkin, the would-be labour leader, is alleged to have urged the strikers to arm themselves and hold a meeting in defiance of the authorities. For this he and four others were on Thursday charged with seditious libel and seditious conspiracy, and they were committed for trial. Bail was allowed on the condition that meanwhile no inflammatory speeches will be delivered and that no attempt is made to hold an illegal meeting. A fair service of cars is being maintained, the strikers not numbering more than 150 out of 800 employees. Visitors have written to the newspapers expressing admiration for "the remarkable discipline displayed by the tramway officials when the attempt was made to create confusion by the strikers leaving the cars." No sooner did a conductor arrive in the office and the bag in which he carried his tickets and money was handed over to the officials than another driver and conductor set off for the derelict car, and with extraordinary rapidity the streets were cleared.

Manchester.—The Corporation tramway employees are asking for increased wages. They apply for an extra shilling a week all round and an annual seven days' holiday. The case for the men has been laid before the Tramways Committee by the general secretary of the Tramway and Vehicle Workers' Union, and the committee has promised to give due and careful consideration to the demands of the men.

Newcastle.—There is an agitation amongst the employees on the Newcastle Corporation tramways for a minimum wage of 24s. for the lowest paid employees of 21 years of age, rising to 28s. at 25 years. The men have been holding meetings to place their case before the public. A deputation waited upon the Tramways Committee to urge the claims of the men, and it was subsequently announced that various concessions would be recommended. Councillor J. Smith, at one of the meetings of the men, estimated that the claims of motormen and conductors would involve an extra cost of only £1,537 per annum. The increase wanted was 1s., making the minimum wage for motormen 32s., rising after seven years' service to 33s. The main reason for pressing the question was the cost of living. Since 1905 the increases in wages had only amounted to 2s., or 1s. 4d. less than the actual advance in the cost of living. The men in the past had proved their loyalty, and that loyalty justified their claim for the advance in wages. But for it the system could certainly not have been so profitable. Out of the surplus of £38,000 last year, £21,000 had been paid to reserve, and £13,000 had been passed over to the relief of the rates. If the full claim of the workmen had been sanctioned at the last sub-committee meeting, it would not have cost £3,000.

Ashton.—No steps are being taken to open up negotiations for a settlement of the dispute between the men engaged on the tramcars in the districts of Ashton, Stalybridge, Dukinfield, Mossley, and Hyde, and their employers, the Oldham, Ashton, and Hyde Electric Tramways Company, the Ashton Corporation, and the Stalybridge, Dukinfield, Hyde, and Mossley Tramways Board, and, as a result, the strike notices which have been issued will terminate at midnight to-day (Saturday). Between 300 and 400 men are concerned, and a strike will necessarily affect the running of the through Manchester and Stockport Corporation cars.

Rochdale.—The tramway employees are demanding various concessions, and a conference has been arranged between the representatives of the men and the Tramways Committee. Already the committee have expressed willingness to make various concessions. The principal points of the men's programme include a ten-hour day; six days a week; and increased rates of pay for various grades.

Glasgow.—The Corporation Tramways Committee have approved of recommendations of a special sub-committee that as from June 1 last the wages of motormen and conductors who have been in the service over six years be raised to 34s. per week, and that from June 1 next motormen and conductors with over seven years' service be paid 35s. per week. The wages at present range from 25s. per week on joining the service to 33s. in the sixth year and thereafter. The increases involve additional expenditure of £9,500 per annum.

## METROPOLITAN TRAMWAYS TRACK BRAKES

Increased Power Instituted as the Sequel to a Mishap.

Arising out of the running away of a tramcar down the hill to the Wood Green entrance of the Alexandra Palace, the driver of a car belonging to the Metropolitan Electric Tramways Company was summoned at the local Bench for driving negligently, thereby colliding with a pony and barrow, the driver of which was injured. The summons, however, was dismissed.

The evidence of Chief Inspector Bradley, of the Public Carriage Department, Scotland Yard, was to the effect that a car travelling at 18 miles an hour on a perfectly level road could be stopped in 36 feet. A steep incline would cause the car to go on further. Witness would not say that accidents could not happen, and admitted "intermittent failure." It must, however, be accepted with great caution that the brake failed without the cause being discovered. If a cause could not be found they had to rely on the word of the driver.

For the Tramway Company it was urged that the route had been open for six years and although it was steeper than Highgate Hill there had never been an accident there before. The cars were duly fitted with proper brakes, but on this occasion the greasy state of the road caused the driver to lose control. If the Act meant anything at all it certainly meant that the offence must be wilful.

The theory put forward by Mr. Adamson, a brake specialist of the Tramway Company, was that, finding his car going beyond the ordinary speed, the driver put on his slipper-brake and handbrake so hard that the wheels skidded, and in these circumstances the electric brake would not act. All the drivers of cars down this hill were specially trained in carrying out the Board of Trade regulations. Any hill with a gradient of 1 in 9 to 14 must be regarded as dangerous, and should be treated with caution. Witness examined the brake the next day and found it in order. He had been convinced that "intermittent failure" of brakes was possible—there had been a case of failure with an inspector standing by the driver, though subsequent examination failed to reveal the fault. This was a failure of the electric brake. Since the accident in the present case the brake-power of the track brakes on these cars had been increased. Witness would not admit in cross-examination that the driver did not act with proper judgment from the top of the hill.

Motorman Cole, the defendant, said he did not suggest that any of the brakes were not in order at the time of the accident; he thought the failure was due to the greasy state of the rails. A sharp shower an hour before had brought up all the grease which there had been no heavy rain to wash away. There was no ordinary traffic over this road, which on other roads brought grit on to the lines and made them less slippery.

## HOURLY NIGHT CARS FOR MANCHESTER.

MOTOR OMNIBUSES TO BE UTILISED DURING EXTENSIVE TRACK REPAIRING.

The Manchester Tramways Committee on August 26 considered a report presented by Mr. J. M. McElroy, the tramways manager, upon the petition recently presented to the committee asking for the institution of a service of all-night tramcars or motor omnibuses. Mr. McElroy stated that until the receipt of the petition recently presented there had been no clear evidence as to what the demand really amounted to. An analysis of the addresses of those who signed the petition had been made, and the general manager had had plans prepared showing the location of each petitioner (a) for the week-night service and (b) for the early service on Sunday mornings. A glance at the plan indicating the demand for the week-night service showed that many of the petitioners live in districts served by the Salford tramways, and a number live in districts very remote from the centre of the city—viz., in Oldham, Ashton-under-Lyne, Stockport, Northenden, Sale, Timperley, Altrincham, Urmston, and Flixton. The greatest demand appears to be in the Cheetham Hill, Harpurhey, Moston, Newton Heath, Moss Side, Rusholme, Longsight, and Levenshulme districts, and to a lesser extent in the Gorton, Bradford, and Openshaw districts.

Mr. McElroy's opinion was that an hourly service of cars ought reasonably to meet the demand at the present time. From the point of view of the tramways department there were objections to the running of an all-night service, the principal one being that it made the efficient maintenance of the track and overhead equipment more difficult. But the department had always endeavoured to meet the demands of the public in every reasonable way, and in the present instance, if the committee determined to fall in with the views of the petitioners, the department would endeavour to carry out the minor repairs during the intervals between the running of the cars, and when more important repairs or reconstructions were necessary the sevices would have to be run by means of motor omnibuses.

The general manager added that there was only one instance in the United Kingdom of the running of all-night services—viz., in London, but in the United States it was quite a common practice to run such services. In the City of New York there was a ten minutes' service running all night. He recommended that the services be limited to week-nights only, the demand for the early morning service on Sundays being so very small. From the department's point of view this was fortunate, because it left a considerable interval for the carrying out of repair work between the running of the last cars on Saturday evening and the first cars on Sunday morning.

The committee adopted the report, which will be presented to the City Council on September 3. If agreed to then the recommendation will be put into operation forthwith.

## MISCELLANEOUS NEWS AND NOTES.

**Perth Tramways.**—The Perth tramways have now been taken over by the Australian Railway Commissioner, and a schedule of working conditions for the employees has been drawn up.

**Belfast Tramways.**—The Glengormely branch of the Belfast tramway system has proved profitable, in spite of the doubts expressed when the line was purchased. In seven months the profits have been £1,017.

**Aberdeen Car Shed Accommodation.**—A special committee of the Tramways Committee are considering a scheme put forward by the manager to erect a car shed capable of holding 24 cars, at an estimated cost of £8,600.

**Thermit, Limited.**—By a printer's error in our issue of August 14 last, the address of Thermit, Limited, was given as 72, Martin's Lane, Cannon Street, E.C. The address of the firm remains as it has hitherto been, viz., 27, Martin's Lane.

**London Roads.**—Mr. J. Burns, the President of the Local Government Board, will preside over a forthcoming conference of local authorities and others concerned in the improvement of arterial road communication in Greater London.

**Free Rides.**—On the occasion of the opening of a huge store at Calgary, the entire tramway system was hired so that everybody could travel to and from the new emporium without charge. The idea proved a capital advertisement for the new concern.

**First-Class Cars to the Theatre.**—Patrons of the first-class cars in Liverpool are appealing for more cars so that they can get to and from the theatres. Now most of the first-class cars cease running at eight at night, and it is asked that the hour should be extended to ten p.m.

**Tramcar Letter Boxes.**—An interesting tramcar letter box experiment is to be made in Wales. After September 1 tramcars leaving Tynewydd and Mardy will have boxes for the receipt of letters. The experiment, which is by no means an innovation elsewhere, is to be tried for six months.

**Machinery for Plymouth Workshops.**—The Tramways Committee have adopted a recommendation made by Mr. C. R. Everson, tramways manager, for the purchase of machinery for the equipment of the workshops belonging to the tramway undertaking at an estimated cost of £1,018. Mr. Everson stated that the adoption of the proposal would result in an estimated saving of £180 per annum.

**Largest Tramway Depot.**—The Lichtenberg car shed of the Greater Berlin Tramway Company which was recently opened is declared to be the largest tramway depôt in existence. There is now accommodation for 500 cars. It is proposed to accommodate the two thousand employees in a garden city formed around the depôt.

**Plymouth Tramways Company.**—At the meeting of the Plymouth Tramways Committee a letter was received from the managing director of the Plymouth, Stonehouse, and Devonport Tramways Company containing a proposal for the extension of the company's tenure of the tramways in Union Street, and the matter was referred to the Finance Sub-Committee for consideration.

**The Tramcar Habit.**—Sir Ian Hamilton, in the course of a report on Canadian military affairs, mentions that the city corps require training in pedestrianism for the reason that they suffer from the prevailing Canadian habits of preferring any other mode of locomotion to making appeal to their legs. Their chief function, he declares, seems very often to consist in standing in the street waiting for a tramcar.

**Improved Methods at Newcastle.**—The City Tramways Department are renewing portions of the permanent way with Sandberg rails weighing 110 lbs. per yard. To prevent water from finding a lodgment under the rails a packing is being utilised of steel slag broken to 1¼ in. gauge and combined with a pitch mixture. A large number of central standards are being replaced with span wire overhead equipment.

**An Addition to Newcastle Tramways.**—On August 19 a direct service was opened from Heaton terminus to Lemington, a distance of over six miles. Previously the Heaton-Scotswood section finished at the Scotswood Suspension Bridge, and passengers to Bell's Close and Lemington had to change cars. The fare for the complete trip to Heaton is 4½d. The section from Lemington to Sandy Banks, near Newburn, will be brought into use when the cars have been supplied with mechanical slipper brakes as advised by Colonel von Donop.

**A Tramway Transfer.**—The tramway from Bradford to Bingley is to be leased, as from September 15, by Bingley Urban Council to Bradford Corporation. The lease will terminate May 17, 1932, and Bradford Corporation will pay Bingley Council annually one-twentieth of the capital expenditure and the interest on the capital, and also £150 per annum, which is payable by Bingley Council to Shipley Council in respect of the junction of the tramway with the Shipley Council's tramways, and the Corporation will take current for working the line from Bingley Council.

**First-Class Fares.**—Glasgow is discussing various tramway points, including one regarding the possibility of first-class car fares. This idea has been tried in Liverpool and with good results, but when the matter was once suggested to the Glasgow Tramways Committee it was declared that the people would protest against such an innovation, for first-class fares would bring about undesirable class distinctions. Nothing, however, will be done until Mr. Dalrymple, the tramways manager, returns from America, whither he has gone to study the latest developments in tramways.

**Luggage Trailers.**—There is a suggestion that the Birmingham Corporation should follow the example of Dresden and put trailers on some of the tramcars for the purpose of carrying luggage. The idea has already been considered, but the matter will require much investigation before it can be put in practice. As the chairman of the Birmingham Tramways Committee explains, any such scheme would have to be carefully prepared and organised. The collection and delivering of parcels was a big undertaking, and would need a special department. He fears, however, that luggage trailers would cause delay.

**A South Lancashire Extension.**—The new tramway at Little Hulton has not yet been inaugurated owing to the refusal of the Board of Trade to sanction the running of cars for the present, an objection having been lodged by the London and North Western Railway Company on the grounds that their two railway bridges across which the tramway runs are not sufficiently strong. The new track, which will bring a very desirable convenience to the residents of the district, has been laid by the South Lancashire Tramways Company, and, commencing at the Walkden Monument, traverses Manchester Road, Little Hulton, Clegg's Lane, and Buckley Lane to the junction of Albert Road and Longcauseway, Farnworth.

**Mr. Fussey Fails to Discriminate.**—The Chairman, Deputy-Chairman, Tramways Manager, and Tramways Electrical Engineer of Hull Corporation have been appointed delegates to the conference of the Municipal Tramways Association, to be held at Sheffield on September 24-26. A councillor bearing the appropriate name of Fussey objected to the resolution, on the ground that "it was time some steps were taken to prevent these deputations for pleasure." Mr. Hargreaves, the deputy-chairman, in an endeavour to clarify the intelligence of his colleague, explained that they were simply following a practice that had stood for ten years, and he had no hesitation in saying that the Council had received good value for the money they had expended in sending deputations to that particular conference. At these meetings they had practically every municipality and county represented, and all the best towns were represented by chairmen, members of committees, and various officials. The Hull Council were dealing with an undertaking in which half a million of money was invested, and they must have the best knowledge available. It is pleasant to record that only two members of the Council supported Mr. Fussey, and that Hull will as usual be well represented at the conference.

**Tramwaymen and the Territorial Force.**—Manchester has achieved a measure of fame in the way of its large proportion of tramwaymen who serve in the Territorial Force. A hundred men have just concluded their annual training, and never before have so many been away to prepare themselves for the defence of their country. A word of praise is not only due to the men but also to the patriotic spirit of the committee and the general manager who gave the men the facilities for training. A full fortnight's leave is given to Territorials, with full pay, this being in addition to the regulation week's holiday with pay which the committee gives to all the men.

**Tests of Wood for Paving Blocks and Sleepers.**—In connection with the timber research work of the Cambridge School of Forestry inaugurated with the aid of the Development Commission, the city engineer of Norwich has offered to test the value of different woods and preservative processes in street paving, while the Great Northern Railway Company have offered to conduct experiments with wood for sleepers. In notifying a scheme for carrying out these objects the school management states that the occasion will afford an opportunity for obtaining information as to the relative mechanical and physical durability of British timbers suitable for outside work. They are endeavouring to obtain promises from estate owners, agents or foresters to furnish supplies of all the most important species of timber which are or can be grown in this country.

**Fares in Leeds.**—A comprehensive scheme for revised fares and stages is promised by the Leeds Tramways Committee. The extension of halfpenny fares to additional routes has occasioned some comment by individuals who expect to take halfpenny fares throughout a section at the same cost as for a ticket for the complete journey. Mr. A. Daggett, the traffic superintendent, has explained that the principle the Tramways Committee worked on was to give half a mile for a halfpenny, and two miles for a penny. From Boar Lane to Lawnswood cost 4½d. in halfpenny fares, but only 2½d. by taking a through ticket. At first the tickets from Boar Lane to Lawnswood were 3d., but since the introduction of two miles for a penny the fare was now only 2½d. Mr. Daggett admitted that the sore point in the new arrangement was the alteration in the penny fares on the Roundhay route, whereby persons now travelling between the Gipton and Byron Street will have to pay 1½d. instead of a penny, as formerly. In explanation of this change, Mr. Daggett states it had been made to facilitate the work of fitting in halfpenny fares.

**Messrs. Kearsley and Company's Annual Convention.**—Something of a new departure was made by Messrs. Robert Kearsley and Company on August 13, 14, and 15, when they held what is described as their first annual convention at Ripon. Gatherings or conventions of the heads of departments and others prominently connected with large firms or companies are fairly well known in America, and their value is well recognised. They are now being more appreciated by British firms also, and combining as they do business with pleasure, they are not only the means of creating friendships among the representatives, but give added strength and unity to a concern. One of the ideals of Messrs. Kearsley and Company is what may be described as the development of the "team" spirit, and undoubtedly the camaraderie which results from such a policy, and from the happy relations which exist between the firm and their staff as a whole has contributed in no small degree to the success which the firm has achieved of late years. On the occasion of this convention two interesting and profitable days were spent at the works in discussing various matters in connection with the trade. The firm also entertained those attending the convention to a dinner, followed by a smoking concert, and on the last day the party started off for a long motor tour through Wensleydale.

**Wireless Electric System of Train Control.**—The London and South-Western Railway Company have for three months past been experimenting with the Prentice "wireless" system of train control on a mile and a quarter of track on the London side of Hampton Court Station. On August 26, by invitation of Mr. G. A. Phillips, of 4, Bishopsgate, E.C., the South-Western management afforded the representatives of the technical Press an opportunity of seeing the system in operation. The party were accompanied in a special train from Waterloo by Mr. Phillips, Mr. J. W. Jacomb Hood, chief resident engineer, L. and S.W.R.; Mr. A. H. Johnson, telegraph and signal superintendent, L. and S.W.R.; and Mr. Buckmaster, chief clerk to Mr. Walker, the general manager; together with Mr. Drayton, chief railway commissioner to the Canadian Government. The installation is similar to the system already tested on the Canadian Pacific Railway, and its introduction on the Hampton Court line has proved so successful that about a month ago Mr. Herbert A. Walker, the General Manager of the London and South-Western Railway, invited the chief officers of other railway companies to attend a demonstration of its working. These experts, we learn, were favourably impressed by what they witnessed. On August 26 two demonstrations were given. On each occasion the train and a separate engine were facing each other on the same line, the visitors occupying the cab of the locomotive drawing the train. The control of the engine was perfect, the brake being applied by the wireless waves and the engine brought to a standstill entirely independent of the driver. By the pressing of a button the driver is enabled to release the brakes after the automatic application of the same, and to proceed if necessary up to the signal. There is also a "buzzer" to attract the driver's attention. Under the engine the apparatus is just as inconspicuous, the feature here being the "harp." The electricity is supplied to a transformer at the side of the track, from which a high-frequency current is transmitted along a wave wire laid in the centre of the rails and encased in wood.

**The Mistake of the Ardent Motorist.**—To the enthusiastic motorist, the popular tramway car is naturally enough anathema. He does not require to use the cars, and neither the cars themselves nor the rails on which they run add to the pleasures of motoring. He seldom stops to reflect that there are millions of people who find the tramcar as great a boon as he finds the motor car. It is the factor of numbers that makes the motorist's suggestion that all tramways should be superseded by motor omnibuses so impracticable. The tramcar is the vehicle of the million, and not even a rolling platform of motor omnibuses would adequately deal with the traffic carried by tramcars in the rush hours in any large town. But the motor enthusiast means no harm, and we owe much to his concentration and devotion to his subject. The attitude of mind sometimes attained by this concentration was amusingly illustrated by the description of twenty-four motor omnibuses which on a recent occasion careered through Windsor Great Park, as "a lovely sight." There had been no rain for weeks, and the "sight" after passage of those omnibuses can be imagined. Another ardent motorist and a member of the Road Board, Sir John Macdonald, also gave evidence of the results of undue concentration on the subject, when speaking at the recent Motor Transport Conference. "I do not say," he remarked, "that *all* tramway rails will be taken up"—even the ardent motorist has his limits of exaggeration—"but very few rails will be laid down in the future. It has been predicted that the last motor omnibus will be found in the British Museum. It is much more likely that this will happen to one of these enormous menagerie cars, if it could be got through the doors of any museum." Here there is again a want of balance. The "menagerie car" is built to carry the masses. It is not, we grant, a "lovely sight"; but it does the work for which it is designed, and it does it well, and there is nothing that can take its place. The mistake of the ardent motorist is that he fails to understand that he must produce something with which to replace the tramway car before he consigns it to the limbo of forgotten things.

## CONTRACTS AND ORDERS.

**Peterborough Council** have allotted a contract to Crompton and Co., Chelmsford, for a new switchboard, at £576.

**Belfast Council** have accepted the offer of Bertram Thomas for the supply of a 3,500 ampere traction switchboard panel.

**Eccles Council** have awarded a contract to the Triumph Stoker, Limited, to equip four boilers with their mechanical stoker.

**Keighley Council** have accepted the tender of Ed. Bennis and Co. for the supply and erection of a Bennis stoker to a Lancashire boiler, at £130.

**Glasgow Council** have accepted the tenders of the Lorain Steel Company and Hadfield's Steel Foundry Company for the supply of special track work.

**A. Graham and Sons,** of Longroyd Bridge, have received a contract for the widening of Long Wall, Huddersfield, in connection with the West Vale tramway extension.

**Messrs. J. W. Courtenay, Ltd.,** of London, have been awarded the contract for the advertising on the cars of the Aberdeen Corporation tramways for the ensuing five years. It was stated that the tender of Messrs. Courtenay, Limited, was the highest of the offers received.

**John Taylor,** of 7, Strand Street, Liverpool, has received orders from Manchester Corporation for 120 tubular sanding devices, and from the Brush Electrical Engineering Company for 100 tubular sanding devices for use on the new cars they are now building for Sheffield Corporation.

**The Railway Track Supply Company of Great Britain,** 81, Gracechurch Street, London, E.C., have recently received an order for 20,000 "Vaughan" rail anchors for the South Manchurian Railways. They have a large number of orders on hand all over the world for these rail anchors, for which they hold the sole licence to manufacture and sell in Great Britain and the British Colonies.

**Warner Trucks.**—The M. and G. Truck and Engineering Company, British licensees for the Warner non-parallel axle truck, have received three repeat orders from the Colombo tramways for vehicles of this class. The first car of the kind, which was sent out in 1910, and was illustrated in our issue of January, 1913, has proved completely satisfactory, and is noted for smooth running and reliability.

## PERSONAL.

**Mr. L. J. Kettle,** deputy city electrical engineer to Dublin Corporation, has had his salary raised from £400 to £600 by increments of £50 per annum.

**Mr. G. F. Upcott,** of Leyton, has been appointed manager of the Walthamstow Council tramways at a commencing salary of £130, rising by annual increments of £10 to £160 per annum.

**Messrs. P. J. McIntosh and W. G. Ross** have been added to the directorate of the Montreal Tramways Company, thus increasing the board from seven to nine members. Mr. McIntosh is in touch with the financiers in New York and Boston, whose association has been so useful to the board. He is also confidential assistant to Mr. W. Rockefeller. In Mr. Ross, who was managing director for many years, the board have the benefit of the advice of one who thoroughly understands the requirements of the company and its patrons.

Digitized by Google

**Mr. J. R. Mead,** the new borough surveyor of Ipswich, was formerly with the borough engineer of Burton-on-Trent, where he had considerable experience in tramway renewals and extensions. This experience served him in good stead from 1905 to 1911 while holding the position of general engineering assistant to the borough engineer of Birkenhead. From 1911 to the present time he has been deputy engineer of St. Helens.

**Bailie. W. B. Smith** and **Mr. W. W. Lackie,** convener of the Glasgow Electricity Department and chief engineer of the Electricity Department respectively, arrived at Montreal on August 24 and proceeded to Toronto to view the generating plant at Niagara Falls. Afterwards they intended to examine several large power stations at Chicago and thereafter proceed to Pittsburg where Bailie Smith will attend a conference on smoke abatement. After a visit to the works of the G.E.C. and Westinghouse Companies they will travel to New York to inspect power stations, arriving at Glasgow towards the end of the first week in October.

**Alderman Fred Smith,** chairman of the Liverpool Tramways Committee, replying to correspondence evoked by his letter to the newspapers on the report of the Select Committee of the House of Commons on London motor traffic, says :—" In the days of the horse tramcar in Liverpool one person was killed by that system for each 6,000,000 carried, whilst with the quicker electric service under municipal control for the ten years ending December 31, 1912, only one person was killed for each 22,000,000 carried. Further, may I add the interesting fact that as the committee gained experience the cost of accidents was practically reduced in 1912 to one-fourth of its cost in 1908."

## FINANCIAL REPORTS AND MEETINGS.

**Silverton Tramway.**—The directors have declared an interim dividend of 1s. per share, together with a bonus of 1s. per share.

**Para Electric Railways and Lighting Company.**—An interim dividend at the rate of 10 per cent. per annum has been declared on the ordinary shares for the half-year.

**Ayr Tramways.**—The annual financial statement shows the revenue to have been £16,295 and the expenditure £9,042, leaving £7,253 gross profit. The net profit was £3,316.

**The British Electric Traction Company.**—The receipts of all the associated companies of the British Electric Traction Company for the week ended August 22 amounted to £55,936. Upon such of the lines as were working both last year and this year the receipts show an increase of £3,174 upon the week.

**A Good Outlook at Swansea.**—The receipts of the Swansea Tramways Company for the last 33 weeks show a total increase of £4,018, and Mr. D. James, the tramways manager, explains that it was due partly to the fine weather, but more particularly to the heavy increase in mileage run and the improved services on various sections.

**The Bristol Undertaking.**—At the next meeting of the Bristol Corporation a report will be brought forward by a special committee in favour of securing Parliamentary powers for the purchase of the tramways. The option of purchase matures in 1915, and the Corporation desires to secure the sanction of Parliament for exercising the option should such then be deemed desirable.

**Dublin and Blessington Steam Tramways.**—Mr. R. S. Guiness presided at the ordinary general meeting. The secretary's report showed the gross receipts to amount to £3,869 and the expenses £4,217. This showed a loss of £348 for the six months as against a profit of £280 for the corresponding period of 1912. The chairman mentioned that there had been a noteworthy increase in passenger traffic, and explained that though the half-year showed a loss yet it was good policy to spend money in developing the undertaking. It was decided to pay a dividend at the rate of 5 per cent. per annum for the half-year. Appreciation was expressed of the energies of Mr. J. P. Tierney, the general manager, to improve the company's affairs.

**Halifax Tramways.**—The annual report of the Halifax Tramways Department states that the amount expended on capital account at March 31 last was £412,762, and the mortgage debt on the undertaking stood at £209,480. The net profit was £12,680, or 1.41d. per car mile, compared with £18,020, or 2.06d. per car mile, in the previous year, and £11,514, or 1.45d. per car mile in 1911. The total revenue was £105,073, or 11.82d. per car mile, and the working expenses £69,661, or 7.77d. per car mile, compared respectively with £101,893, or 11.63d. per car mile, and £62,890 or 7.18d. per car mile in the previous year. The route mileage was now equal to 54 miles 1,549 yards of single track, and the average amount of units of electrical energy used per car mile run was 1.81, as against 1.69 the year before. The gross profit is equal to 8.04 per cent. on the capital expenditure, and the net profit equal to 3 per cent.

## WEEKLY TRAFFIC RETURNS.

The official traffic returns of 67 of the principal undertakings of the United Kingdom for the week ended August 23 amounted to £259,958, or £19,244 more than in the corresponding week last year, while the track mileage was 2,712, or 52 more than for the corresponding week. The receipts were at the rate of £95 17s. 1d. per track mile, an increase of £5 7s. 3d. per mile as compared with last year.

## COPPER AND ALUMINIUM MARKET.

August 29, 1913.

Messrs. Henry R. Merton and Co., Ltd., 2, Metal Exchange Buildings, Leadenhall Avenue, E.C., supply the following quotations of prices per ton :—

| | Friday, August 29. | Last week. | A Year Ago. |

THE

# Tramway & Railway World

Vol. XXXIV. No. 12. | LONDON, SATURDAY, SEPTEMBER 6, 1913. | [Established in 1892.

ANNUAL SUBSCRIPTION (Postage Prepaid)—in the United Kingdom, 25s.; for all places abroad, 30s.

Including sixty-four issues, of which twelve are large illustrated numbers, printed on fine art paper.

## NOTICES.

All Communications and Advertisements for next Saturday's issue should be received not later than 3 p.m. on Friday.

Advertisements for the next issue of which proof is desired should reach us by the second post on Wednesday.

The Editorial and Publishing Offices of "The Tramway and Railway World" are at Amberley House, Norfolk Street, London, W.C.

Telegrams: "TRAMIGRO, LONDON."
Telephone: No. 2948 GERRARD.

## WEEKLY LIST OF TENDERS INVITED.

### BINGLEY URBAN DISTRICT COUNCIL.

Invites tenders for the supply and erection of the following Electric Lighting plant :—

Section A.—Rotary Converters and Transformers.
Section B.—A.C. E.H.T. and L.T., and D.C. Switchgear.
Section C.—Low Tension Cables.

Contractors may tender for any section, but not for part of a section.

Particulars of the above sections, together with general conditions and form of tender, may be obtained from the Consulting Engineer, Walter Emmett, M.Inst.C.E., 35, Commercial Street, Halifax, on payment of two guineas, which sum will be refunded on the return of the specification filled in with a *bonâ-fide* tender, which shall not subsequently be withdrawn.

Duplicate specifications can be obtained at an additional cost of half-a-guinea each, not returnable.

Tenders, endorsed "Electric Lighting," must be delivered to me on or before noon on September 15, 1913.

The Council does not bind itself to accept the lowest or any tender.

ALFRED PLATTS,
Clerk.

Town Hall, Bingley.

### MANCHESTER CORPORATION TRAMWAYS.

The Tramways Committee of the Manchester Corporation are prepared to receive tenders for the following, viz. :—

(a) Beaver, Serge, and Pilot Cloths.
(b) Making-up of Uniform Clothing.
(c) Uniform Caps.

Specifications and forms of tender may be obtained on application to Mr. J. M. McElroy, General Manager, Corporation Tramways, 55, Piccadilly, Manchester.

Tenders are to be addressed to the Chairman of the Tramways Committee, 55, Piccadilly, Manchester, and must be received not later than 10 a.m. on Tuesday, September 16, 1913.

The Committee do not bind themselves to accept the lowest or any tender.

THOMAS HUDSON,
Town Clerk.

Town Hall, Manchester,
August 29, 1913.

### MATLOCK URBAN DISTRICT COUNCIL.

TRAMWAY CABLE.

The above Council are prepared to receive tenders for about 1,067 Lineal Yards of Patent Steel Wire Tramway Cable, with Manilla Core (3¼in. in circumference), delivered at their Depôt, Matlock, carriage paid.

Particulars, specifications, and terms as to payment may be obtained from Mr. C. P. Foster, Tramway Manager.

Tenders, accompanied by samples of wires, to be delivered at my office (marked "Cable") not later than 12 noon, Saturday, September 20, 1913.

The Council do not bind themselves to accept the lowest or any tender.

R. TAYLOR,
Clerk to the Council.

Town Hall, Matlock,
September 3, 1913.

### SOUTHAMPTON HARBOUR BOARD.

TO CONTRACTORS.

The Southampton Harbour Board is prepared to receive tenders for Providing and Laying Rails for Electric Gantry Cranes on the Town Quay, Southampton.

Drawings, specification, and conditions may be inspected upon application to Mr. E. Cooper Poole, A.M.Inst.C.E., Engineer to the Board, at the Board's Offices, Southampton, on the deposit of a sum of one pound, which deposit will be returned upon the receipt of a *bonâ-fide* tender. Sealed tenders (which must be on the printed form supplied), endorsed "Tender for Crane Rails," to be delivered to the undersigned not later than 12 o'clock noon, Saturday, September 20, 1913.

No pledge is given to accept the lowest or any tender.

By order, J. E. PAULTHORPE,
Clerk to the Board.

Harbour Board Offices,
Town Quay, Southampton,
September 1, 1913.

### VICTORIAN STATE RAILWAYS.

The Agent-General for Victoria, Australia, invites alternative tenders for the supply and delivery f.o.b. port of shipment and c.i.f. Port of Melbourne, fully inclusive of Australian Customs duties, etc., of the following Rails and Fishplates :—

Contract No. 25,005.—Approximately 27,079 Tons of 80lb. Steel Rails.
Contract No. 25,005.—Approximately 2,215 Tons of Steel Fishplates for 80lb. Steel Rails.

Specifications, conditions of contract, and forms of tender may be obtained by *bonâ fide* tenderers at the offices of the Consulting Engineers, John Coates and Co., Limited, 25, Victoria Street, Westminster, London, S.W.

Tenders must be delivered to the Agent-General for Victoria, Melbourne Place, Strand, London, W.C., not later than 11 a.m. on Wednesday, October 8.

A preliminary deposit equal to ninepence for each and every ton of rails and fishplates must accompany each tender.

The Government of Victoria does not bind itself to accept the lowest or any tender.

### COUNTY BOROUGH OF WIGAN.

ELECTRICITY WORKS EXTENSIONS.

The Corporation of Wigan invite tenders for the supply and erection of the following plant :—

1,500 kw. Turbo-Alternator Ejector-Jet Condenser, Pipework, and all Accessories.

Specification, with form of tender, etc., may be obtained on application to Mr. James Slevin, Borough Electrical Engineer, Bradford Place, Wigan, on payment of £3 3s. od. for each specification, which will be returned on receipt of a *bonâ-fide* tender.

Sealed tenders, endorsed "Tender for Turbo-Alternator, etc.," to be delivered to the undersigned on or before Saturday, the 20th instant.

The Committee do not bind themselves to accept the lowest or any tender.

WILLIAM HENRY TYRER,
Town Clerk.

Town Clerk's Office,
King Street West, Wigan,
September 2, 1913.

### COUNTY BOROUGH OF BURNLEY.

The Corporation invite tenders for a 4-Ton Motor Wagon, with petrol engine, for the purpose of the collection of household refuse and for street watering. Copy specification will be sent to contractors willing to tender. Tenders must reach me on or before October 12.

PEREGRINE THOMAS,
Town Clerk.

Town Hall, Burnley,
August 14, 1913.

## POSITIONS VACANT.

### TORQUAY TRAMWAYS COMPANY, LTD.

PLATELAYER.

Applications are invited for the above position. Candidates must have experience in maintenance work, and must be able to, or willing to learn to, drive a car when required.

Applications, stating experience and wages required, together with copies of testimonials, to be forwarded to the undersigned.

H. HOLLIDAY,
Engineer and Manager.

Car Sheds, Torquay.

### LEEK URBAN DISTRICT COUNCIL.

APPOINTMENT OF ELECTRICAL ENGINEER.

The Council invite applications for the appointment of Electrical Engineer to take entire charge of their Electricity Undertaking.

Experience in three-wire D.C. supply essential.

Forms of application and list of duties may be obtained from the undersigned.

Salary £225 per annum, rising to £275 by annual increments of £10, subject to satisfactory service.

Applications, endorsed "Appointment of Electrical Engineer," to be received by me not later than 12 o'clock noon on Monday, September 15.

Canvassing not allowed.

HAROLD HENSHAW,
Clerk to the Council.

Town Hall, Leek,
September 3, 1913.

### CLERK FOR TRAMWAY OFFICE.

Clerk for Tramway Office wanted; must be good arithmetician and accurate. Wages 23s. per week, rising to 25s. at the end of 12 months' satisfactory service. Applications in own handwriting, with copies of testimonials, to be addressed to C. L. E. Stewart, Tramways Manager, Rawtenstall.

### TRAMWAY CLERK.

Wanted, Tramway Clerk, Shorthand and Typist; experience in Storekeeping desirable. Wages 20s. to 30s., according to ability and experience. Send particulars and copies of testimonials to Manager, Tramways, Colchester, stating age, wages asked, and when could commence duties.

## TRAMWAY BENEFITS AND SOME INCONVENIENCES.

A dead set has been made against tramways, especially in London, not on their merits but as a party question. "Scrap them!" is the cry of the opponents; but they take good care not to weaken their case by suggesting any alternative for the present poor man's conveyance. The reason why is that a substitute does not exist except it be a tube or other underground railway. The tramways have enabled workmen to travel in their thousands from the outskirts of large towns where railway facilities do not exist, to their various occupations in the business centres, the trams taking them back at night at all hours and in any numbers. To give a concrete case:—A return ticket in London from the southern suburbs to the Temple costs 5d. by tram, 7d. by omnibus, and 9d. or 10d. by rail. If it were attempted to work the two latter means of conveyance under precisely the same conditions as to fares and rates the results would be a *débacle*. No one suggests that the trams are perfect, but no one suggests a perfect substitute for them. So the public must perforce put up with such inconveniences as are inherent in the system, for it is unimaginable that the thousands of workers and voters who now use this mode of getting to and from their work would stand, for a moment, being deprived of it by that scrapping of the tramways which is advocated by their extreme opponents. At the same time, it would be well if certain reasonable objections were minimised as much as possible; to the advantage of "the stitch in time" we have drawn attention before—but the stitch, when put in, should not be a "chain" but a "lock" stitch—in other words, and speaking of British tramways generally, any repairs when made and whenever possible, should be radical ones, not temporary alleviations of the evils. Nothing but the strictest supervision will ensure this, for it is the bent of too many workmen nowadays not only to take as long as possible over a job but to leave it so as to "make work" for their brethren, instead of saving future labour on it. This is noticeably the case in road and permanent-way repairs, which are a great source of inconvenience to all other road traffic and give rise to more complaints than any other of the "objectionable" features of a tramway. It is, of course, out of the question for all repairs to be done on Sundays or at night. The unions would not allow it except at a prohibitive cost; moreover, anything done at those times is generally not so durable as work effected during the ordinary hours of daylight; but whenever effected the greatest care should be taken that the very best work is put in so as to avoid that repetition of the whole nuisance after a short interval as so often happens. The untidiness of the cars owing to the litter of used tickets, the want of judgment in manipulating the ventilating contrivances, are comparatively small matters, but they all tell in strengthening the case against tramways as stated by their bitter critics, and it would therefore be advisable to reduce all causes of complaint to the possible minimum.

## THE MUNICIPAL TRAMWAY CONFERENCE.

Preparations are now well advanced for the twelfth annual conference of the Municipal Tramways Association, which is to be held in Sheffield from September 23 to 26. Mr. A. R. Fearnley, general manager of the Sheffield tramways, is, of course, the president for the year, while Mr. C. J. Spencer, general manager at Bradford, as honorary secretary, is having his hands well occupied in making all the necessary preparations. A copy of the main items of the programme, which has been carefully arranged, will be found in this issue. It will be seen in the first place that the Corporation of Sheffield are vieing with all other municipalities who have received the Association in the hospitality which they are offering and in the facilities for sight-seeing and obtaining information which they are placing at the disposal of the delegates. There will be the usual reception by the Lord Mayor and the Chairman of the Tramways Committee as a preliminary to the opening of the Conference proper. After Mr. Fearnley has delivered his presidential address, a subject of very great interest at the present time will come on for consideration, viz., the advantages and disadvantages of platform fare collection. It is to be introduced by a paper by Alderman S. Flint, of Leicester, and the discussion is to be opened by Councillor J. A. Smith, of Aberdeen, chairmen of their respective tramway committees. It is to be noted that both of the towns represented by these gentlemen have led the way in adopting the pay-as-you-enter system, and already have cars specially adapted for the purpose running on their lines. The information which the two gentlemen will be able to place before the Conference will thus be of great importance, seeing that it comes at first hand from persons who have had practical experience, though not as yet of very long duration, of the system. There ought to be a good deal of discussion on this paper, seeing that the question of the applicability of the pay-as-you-enter principle to double deck cars is still doubted by some tramway men. With the single deck car in America it has, of course, proved an unqualified success. The next paper, which will be by Councillor W. C. Fenton, will deal with the maintenance of paving on tramway tracks, as affected by Section 28 of the Tramways Act, 1870. This is a section of the Act which gives rise to a great deal of

Digitized by Google

grievance at the present time among tramway owners, as it is here that provision is found compelling the tramway authority to maintain the street surface between the rails and tracks and for 18 in. outside. This obligation is, of course, becoming very onerous owing to the introduction of heavy motor vehicles, which wear out the paving which the tramway undertaking has to maintain. A larger and more general subject is that of urban passenger transport, which is to be treated by Mr. J. B. Hamilton, general manager, Leeds, on the following day. The London aspect of this problem, which, of course, is the most serious one in the country, will no doubt be introduced by Alderman Littler, chairman of West Ham Tramways Committee, who is to open the discussion. Seeing that by the introduction of the motor omnibus and the trackless trolley car, questions of passenger transport by road are in a condition of flux, it may be expected that this discussion also will be particularly interesting. The Thursday afternoon is to be occupied by visits to steel works in Sheffield, and to the power station and car depôts of the tramway system. The annual dinner of the Association in the evening will really close the proceedings, except for the business meeting on the Friday morning, and an excursion to the Dukeries. On the whole, it seems tolerably certain that the members of the Association have an interesting and instructive time in front of them.

## RAILLESS TROLLEY CAR PROPOSALS.

BOURNEMOUTH.—A company propose to install a railless trolley car service from the County Gates to Canford Cliffs and the Sandbanks, in the vicinity of Bournemouth, with a view to develop one of the most charming districts on the South Coast. Replying to objections urged against the scheme, the promoters' engineers state that the poles they propose to erect would not be of the tramway type, but light poles erected wherever possible in a line with the trees, in positions where they would be practically out of sight; that the type of current collector to be used is practically noiseless; and that the wear on the roads would be considerably less than that caused by the operation of the existing petrol vehicles.

YORK.—At their September meeting the City Council referred back to the Tramways Committee for further consideration their recommendation to apply for powers to run railless trolley cars along two routes to Heworth and Haxby Road. Councillor Sharp, who moved the adoption of the report, in reply to a question stated that the terms offered with the demonstration motor omnibus which was brought to the city were altogether prohibitive. Councillor Clarke observed that the only objection that was made at the time of the trial was that the omnibus did not hold sufficient people.

ABERDEEN.—The shareholders of Aberdeen Suburban Tramways Company have given the directors authority to work railless trolley cars or other mechanically-propelled vehicles in connection with the undertaking. Replying to a shareholder, the chairman said the directors were alive to what had been accomplished in connection with 'buses in London. It would not be wise to say definitely what vehicles would be best, but there was a strong feeling in favour of motor 'buses among the directors.

## COVENTRY TRAMWAY DEVELOPMENTS.

The Coventry Corporation has commenced the extension of the tramway depôt recently sanctioned by the Local Government Board at a cost of £20,475. The scheme provides not only for the enlargement of the depôt, but also for the provision of new cars, additional cables, and signals. The new car shed will be erected alongside the existing building, and will accommodate 18 cars on six tracks, with inspection trenches. A feature of the depôt will be a mess room, with a bathroom, for the employees. The undertaking now comprises 41 cars, and five more are on order. Two of the new cars will be of the roof cover pattern, and the three others will be so constructed as to enable tops to be fitted if so desired. The cars are of the single truck type, so that the narrow streets can be negotiated with ease, and they will carry 50 passengers each. Much has lately been done to improve the service, but here the undertaking is hampered by the congestion in the streets, most of which are so narrow that speed must always be sacrificed for safety, and much of the tramway is only single track. Indeed out of the total length of 14 miles only about two are double tracked. At the power station at Priestley Bridge two 500 kw. motor converters have recently been installed for transforming the current supplied by the Corporation.

## CORPORATION TRAMWAYS IN 1912-13.

LIVERPOOL.

The annual report upon the Liverpool Corporation tramways, issued by Mr. C. W. Mallins, the manager, and notified in our issue dated April 5 last, shows that financially the year 1912 was the best on record. Over 134 millions of passengers were carried at an average fare of 1.128d per passenger. The total receipts were £668,220; operating costs, £425,018; interest, £50,096; sinking fund, £59,248; reserve and renewals, £66,929; and relief of rates, £66,929. The report also gave the results of the general manager's inquiries among the other tramway managers into contract and transfer tickets and children's fares, excerpts from which appeared in this journal on August 9.

COMPARISON OF PENNY STAGES IN 68 TOWNS

A diagram attached to a later report on contract and transfer tickets and children's fares shows the average length of the penny stage given in the working-class districts as compared with sixty-eight other undertakings throughout the country. The average length of the penny stage in Liverpool working-class areas is fully three miles, as compared with two and a quarter miles in Manchester, Birmingham, and Glasgow, two miles in Leeds, and rather under two miles in London, the distance gradually tapering down to less than a mile in Preston, Colchester, and Nelson. Sheffield, where there is a universal penny fare, does not appear in the list. A second diagram gives the average length of the penny stage on the whole of the Liverpool system, as compared with sixty-eight other towns. The longest average is that of Liverpool, 2 miles 802 yards, the shortest being Nelson, 1,495 yards; while the average for sixty-eight undertakings is 1 mile 798 yards.

NEWCASTLE-ON-TYNE.

The annual report of the general manager (Mr. Ernest Hatton) of the Newcastle Corporation tramways for the year ended March 31 last shows that the Corporation owns 56 miles of tramways, and that last year established a further record, due to the continued prosperity of local industries. The number of passengers was over 52 millions, an increase of three millions. The gross receipts were £235,321 as against £223,565 for the previous year. The traffic expenses were £64,493, an increase for the year of £3,830, due to the additional cars in service and also to higher wages. A table of statistics shows the great progress made by the undertaking. The receipts in 1905 were £197,173, and have increased with a yearly regularity to last year's record of £235,321. The surplus, which was £19,344 seven years ago, is now £38,505. The sum paid to the relief of rates last year was £13,461. A further amount of £3,300 had been charged to revenue for the purchase of motor omnibuses for the Westerhope route; and a balance of £21,189 carried to the reserve and renewals fund, which then amounted to £119,407. The percentage of gross profits for the year on the capital expenditure was 9.3 per cent. The omnibus services inaugurated on the Westerhope route had met a long-felt want in that district, and were acting as a beneficial feeder to the Fenham cars. The report indicates that this year the reserve and renewals fund will be heavily drawn upon, it being imperative to renew considerable lengths of track and several junctions. Additional plant had been provided at the power station to meet the increasing demand for power. Mr. Hatton says that the undertaking has now reached a stage when renewals must be encountered annually and not occasionally, as in the past. While there was no occasion for doubt and uneasiness as to whether the undertaking could meet these expenses, so long as a firm policy was pursued in resisting all attempts to deplete the net annual revenue by saddling it with still heavier charges than it now carried, on the other hand, if that policy were not pursued, the undertaking might eventually have to be supported out of the rates.

## FAILURE OF THE DUBLIN TRAMWAY STRIKE.

The partial strike of Dublin tramway workers has been associated with sanguinary scenes due to the bitter feeling created by the agitators. On Saturday there was fierce rioting, during which one man was killed and hundreds of others injured. The rioting began with attacks on the tramcars, for, despite the strike, a good service has been maintained with the aid of police riding on the platforms. Mounted police also patrolled the routes. The strikers arranged for a meeting in Sackville Street on Sunday. This was proclaimed, but Mr. Larkin and his followers announced their intention of holding the meeting. A warrant was issued on Saturday for the arrest of Larkin and others on charges of sedition and incitement, but in Larkin's case the police were unable to execute it. He appeared at the window of an hotel on Sunday, and, tearing off a false beard, attempted to hold a meeting. He was arrested, and has been remanded without bail. To mark appreciation of the action of the majority of the tramwaymen who have so loyally stood to their posts, a Citizens' Committee has opened a fund for the purpose. It is being liberally responded to At a meeting of 400 employers of labour a resolution was passed declaring that the position created by the Irish Transport and General Workers' Union (a union in name only) is a menace to all trade union organisation, and has become intolerable. In consequence of two of the employees at the car works having refused to repair cars which had been damaged by strikers, they were discharged. The other workmen then ceased work. Mr. Murphy, the chairman of the company, has stated that it will be rather a convenience to close down the works for a time.

## THE MUNICIPAL TRAMWAY CONFERENCE.

The programme for the twelfth annual Conference of the Municipal Tramways Association, to be held in Sheffield from September 23 to 26, has just been issued. Omitting visits, excursions, etc., the following are the main items of the programme :—

**TUESDAY, SEPTEMBER 23.**

8 p.m. Informal reception at the Royal Victoria Station Hotel.

**WEDNESDAY, SEPTEMBER 24.**

10 a.m. Meeting of the Executive Council.

10.15 a.m. Reception by the Lord Mayor and the chairman of the Sheffield Tramways Committee.

10.30 a.m. Conference.

Presidential Address by Mr. A. R. Fearnley, general manager, Sheffield Corporation Tramways.

Paper :—"Advantages and Disadvantages of Platform Fare Collection," by Mr. Alderman S. Flint, chairman, Leicester Corporation Tramways Committee.

1 p.m. Luncheon at the Grand Hotel, at the invitation of the Tramways Committee.

2.30 p.m. Resumption of Conference.

Paper :—"The Maintenance of Paving on Tramway Track as affected by Section 28 of the Tramways Act, 1870," by Mr. Councillor W. C. Fenton.

10.30 p.m. Supper at the Town Hall at the invitation of the Lord Mayor.

**THURSDAY, SEPTEMBER 25.**

9.45 a.m. Meeting of the Executive Council.

10 a.m. Meeting of the Managers' Section.

10.30 a.m. Conference resumed.

Paper :—"Urban Passenger Transport," by Mr. J. R. Hamilton, general manager, Leeds Corporation Tramways.

12.45 p.m. Luncheon at the Royal Victoria Station Hotel, at the invitation of the Tramways Committee.

2.30 p.m. Visits to works.

7 p.m. Annual Association Dinner at the Royal Victoria Station Hotel.

**FRIDAY, SEPTEMBER 26.**

9 a.m. Meeting of the Executive Council.

9.30 a.m. Annual business meeting.

The headquarters of the Association during the Conference will be the Royal Victoria Station Hotel. Special arrangements have also been made at the Grand Hotel, the King's Head Hotel, and the Albany Temperance Hotel.

## REPORT ON A NEWCASTLE COLLISION.

Lieut.-Colonel von Donop, of the Board of Trade, has reported upon the accident which occurred on June 21 on the Newcastle Corporation tramways. A car, with a partially disabled hand-brake, was being driven empty along Elswick Road, when the driver lost control and it collided with a car standing on the same line. The car which ran away was fitted with the Newell magnetic slipper brake, supplied by the Westinghouse Company, and with the usual hand-brake working blocks on the wheels. It was a single-truck double-decked car, with a top cover. The driver of the runaway car reported the disablement of the hand-brake, but was advised to continue his circular tour before sending the car back to the depôt. A fitter named Urwin and a time-keeper, Fairless, took charge of the car and proceeded to take it to the depôt. Urwin attributes the accident to the failure of the magnetic brake, but subsequently the brake was proved to work excellently. The report proceeds :—"Under these circumstances, it seems very improbable that it was a defect in the brake which caused its failure to act, and it is more likely that it was due to some error on Urwin's part in the application of it. Urwin had been in the employ of the Corporation for 11 years, during the last five of which he had been employed as a fitter. His experience as a fitter, in erecting and testing the equipment of cars, must have made him thoroughly acquainted with the working of them, and he should therefore have been quite capable of driving a car. But he had never been really trained as a motorman, and he had not had any continuous experience of driving cars, so a mistake on his part when acting as motorman is not surprising." Colonel von Donop's opinion is that some mistake was made by Urwin in the application of the brake which thereby neutralised its action, and that he did not attempt to rectify it until too late. The three causes to which this accident must be attributed are therefore as follow :—Firstly, the fact of the car not having been at once taken out of service when it was found to be defective; secondly, the omission to apply the hand brake from the rear end of the car when it came to a stand at the big lamp; thirdly, the want of skill and resource on the part of fitter Urwin in the use of his brakes when the car first started away from rest. In the face of this accident, the Corporation should consider the advisability of fitting their Westinghouse magnetic brakes with the mechanical attachment which allows of the slipper being applied by hand as well as electrically.

## MISCELLANEOUS NEWS AND NOTES.

**New Route at Birmingham.**—The Hagley Road route has been completed and opened. The new line is just over two miles long.

**Prosperity at Torquay.**—The Torquay tramways carried 118,425 passengers during the three days of the regatta, as against 84,281 last year.

**New Depot for Leeds.**—The City Council have received sanction for the borrowing of £29,000 for a new tramway depôt in Sovereign Street.

**First-Class Car Experiment at Birmingham.**—In response to a request from the residents of the Hagley Road district the Tramways Committee have agreed to make an experiment in running first-class cars.

**The Petrol-Electric Tramcar.**—The latest route upon which the London County Council are running a petrol-electric tramcar is between London Bridge and Greenwich Church, *viâ* Tooley Street and Bermondsey.

**Site for a New Depot at Leeds.**—The Tramways and Electricity Committee have arranged to purchase 4,625 square yards of land, at Guiseley, for the purpose of an additional depôt and sub-station, at the price of 2s. per yard.

**Manchester's Hourly Night Service.**—The City Council on September 3 agreed to the Tramways Committee's recommendation for the running of an hourly service all night, and the cars began running early the following morning.

**Zone Fares.**—A suggestion for zone fares is being put forward in Glasgow. It is urged that the tramways department should follow the precedent of the railway companies and grant concessions to regular travellers by issuing zone tickets.

**Facilities for Footballers.**—The Tramways Committee of the Newport Corporation has decided to recommend special facilities being granted on Saturdays during the football season to those attending matches at the Athletic Ground and Somerton Park.

**Glasgow Going Ahead.**—For the first quarter of the financial year of the Glasgow Corporation tramways ended on August 31 the traffic receipts are £19,000 above the corresponding period of last year. The number of passengers carried increased by 6,000,000.

**Aluminium Sheets.**—The British Aluminium Company have issued a card suitable for hanging up, giving a great deal of useful information in regard to weights, dimensions, etc., of aluminium sheets, along with comparisons with weights of sheets made of other metals. A large number of gauges are included.

**Linking Up Swansea.**—The new tramway through the recently widened Castle Street, Swansea, which will have the effect of linking up all the tramway sections of the town, and giving a through run from Morriston to the Docks, is now almost completed. The Board of Trade inspection may take place during the current month.

**York Tramway Enterprise.**—The Corporation tramways reaped a golden harvest during the recent races, and the new South Bank extension was largely patronised. Mr. Chipper, the traffic manager, put every available car on the route, and most of them were crowded. The new route affords a speedy and convenient journey to the racecourse.

**The Ackley Brake and Supply Company** of New York make a special invitation to any tramway or railway men from abroad who may be attending the electric railway convention at Atlantic City, from October 13 to 17, to make the company's stand at the exhibition held in connection with the convention their headquarters during their stay.

**Blackpool Tramway Records.**—Mr. C. Furness, manager of the Corporation tramways, reports fresh records in traffic receipts. Every day the receipts are showing an increase of over £100 as compared with last year, and every week there is an increase of about £1,000. In August the single deck open cars, running on the circular route, which are taking about £800 a week, showed an increase of £1,000.

**Posters on Tramcars.**—The latest poster on the Glasgow tramcars is issued by the Health Department. It takes the form of a black-bordered notice which gives an eye-arresting picture of a gigantic fly about to settle on a baby crawling on the ground, and which bears the words, printed in large type, "Kill that fly, and do it now." The aggressiveness of the poster is emphasised by the placing of four copies on each car.

**The Charge for Current at Aberdeen.**—The Town Council have decided that the charge to the Tramways Committee for current shall remain for another year at the present rate of .85d. per unit, subject to revision at the end of the year with a view to a reduction should the circumstances warrant it. It was thought that to lower the charge now would be to jeopardise the electricity undertaking for the benefit of the tramways.

**Return and Dinner-Hour Tickets at Darwen.**—The Tramways Committee have decided to give a three months' trial from October 1 to a scheme submitted by Mr. F. G. S. Hosken, the manager and engineer, for the issue of a 2d. return ticket on the Bolton Road section and a 1d. return dinner-hour ticket on all sections between 12 and 1 o'clock on the outward journey, the return portion to be available not later than 2 o'clock.

**Stirling Tramways and Electrification.**—The Town Council had a special meeting on September 1 to consider the offer of Mr. George Balfour, London, to purchase the electric light undertaking as a preliminary to the electrification of the tramways. The price which Mr. Balfour proposed to pay for the undertaking was the sum which would relieve the Corporation from all outstanding indebtedness. The Council decided to ask Mr. Balfour to submit details of his offer.

Digitized by Google

**The Useful Tramcar.**—The suggestion is being put forward in Manchester that letter-boxes should be placed on the all-night cars so that people can catch the post in town instead of dropping their letters in suburban pillar boxes where the collections are made early in the evening.

**Farthing Fares.**—A correspondent ventilates a grievance against the Kidderminster and Stourport Electric Tramway Company. He says:—"I have been told by more than one official of the Tramway Company that farthings are always accepted and given in change, but this is not so, as on more than one occasion they have refused to give me the farthing. There are 1¼d. stages, and as they can issue 1½d. tickets how is it that one cannot obtain 1¾d., 2¾d., or 3¼d. tickets, as the case may be?"

**New Circular Route at Liverpool.**—By the construction of simply three new curve junctions, without the addition of any straight line, the Tramways Committee have decided upon instituting a new circular and alternative route. This will connect the centre of the city with Netherfield Road and the north docks, forming practically a duplicate track. For the round journey of five miles twopence will be charged. The route will probably be opened before the end of the year, Mr. J. A. Brodie, the engineer, having arranged to begin the work as soon as possible.

**South Lancashire Tramways and a Bridge Difficulty.**—Consent at last having been given by the Board of Trade, the running of cars has begun over the new tramway from Farnworth through Little Hulton to Walkden. The trouble arose in connection with an objection by the London and North Western Railway Company, which alleged that a bridge was not safe enough. The point has not yet been settled, but the South Lancashire Tramways Company are getting over the difficulty by calling upon passengers to change cars at the bridge for others in waiting on the other side.

**Bristol Tramways Company's Tours.**—Successful holiday tours have been arranged by the Bristol Tramways and Carriage Company (Bath Branch). The first of the six days' tours concluded on August 30. The party travelled by one of the latest road motors through West and North Wales. Mr. Seckington, traffic superintendent, travelled with the party, and the passengers presented him with a silver cigarette case suitably inscribed. There was also a pleasant two days' week-end tour to Southsea, when the party was accompanied by Mr. A. B. Bryant, the local manager.

**Motor Omnibuses for Marple and Stockport.**—Marple Urban Council have granted two licenses to Mr. J. Clayton, of Offerton, on behalf of the British Automobile Traction Company, London, to run motor 'buses between Marple and Stockport. An hourly service is to be run, and there will be a more frequent service later if the traffic warrants it. Mr. Clayton's letter stated that the same company were also going to run a service between Poynton and Newtown *viâ* High Lane and Disley, and at Marple there would be a garage containing other 'buses for other routes which it was proposed to open up. The vehicles will be single-decked.

**Proposed Link Between Middlesex and London United Tramways.**—At the meeting of the Acton District Council the Clerk presented a report with reference to the meeting between representatives of the Council and the Middlesex County Council concerning the proposed linking-up of the Middlesex tramways with the London United system. The engineer and tramway manager of the County Council, he stated, submitted a plan for the connection between the two systems by way of King Street. After considering the advantages and disadvantages of this route the members inspected a suggested connection by way of the Steyne, either through Rectory Road or Steyne Road.

**By Tramcar to the Hop Gardens.**—It is now possible to travel from the Thames Embankment to the hop gardens and orchards of Mid-Kent practically all the way by tramcar. The first stage is to Woolwich. From thence another car can be taken to Wickham Road to meet the tramway which goes to Bexley, and the journey can be continued by the service running to Dartford. A tramcar can be taken to Horn's Cross a few miles further on. A two-mile walk enables a car to be taken from Swanscombe to Gravesend and Milton. Another two-mile walk brings one in touch with the tramways round about Rochester and Chatham, and then Rainham can be reached by car. This journey extends over 34 miles and costs 2s.

**The Dispute in the Ashton District.**—The threatened strike of tramwaymen at Ashton was postponed for a ballot of the men to be taken on the final offer of the three tramways authorities concerned, with the result that the employees decided against striking. The Tramways Committee of the Joint Board draw attention to the fact that out of 35 tramways in Lancashire and Cheshire 17 were paying less than the terms now offered to the men, eight were paying the same, and ten (including Manchester and Salford) were paying more. The Tramways Committee also point out that the terms offered would cost the Board an additional sum of £1,000 per annum, whilst the terms the men ask for would entail an additional cost of upwards of £2,000 per annum.

**Berlin's New Electric Railway.**—The new electric railway in Berlin between Gesunbrunnen and the suburb of Neuköln is to be proceeded with without further delay. The scheme was brought forward six years ago, but has only recently received the sanction of the authorities. The railway will be a combination of the overhead and underground type, similar to the existing Berlin Elevated and Underground Railway, but, owing to the insistence of the municipality, a larger portion than originally proposed must be constructed underground. This, of course, will increase the cost, and the municipality has agreed to give £205,000 towards the additional cost. The railway will be nearly six miles long, and will cost between four and five millions. The traffic is estimated at 60 million passengers per year, and fares will range from 1½d. to 2½d. There is reason to believe that the rival scheme for an elevated electric railway will be abandoned.

**Glasgow Tramwaymen.**—At the last meeting of the Glasgow Corporation it was decided to make no change in the working hours of motormen and conductors. A proposal to reduce the hours from 51 to 48 per week was rejected, it being pointed out that this concession would cost £14,200 a year. The chairman of the Tramways Committee stated a petition had been received asking that if the Committee were going to consider hours and wages they should give an increase in wages and not a reduction of hours. It was decided that as from June 1 last till May 31, 1914, the wages of motormen and conductors who have been in the service over six years be 34s. per week, an increase of 1s., and that as from June 1 the wages of motormen and conductors who have been in the service over seven years be 35s. per week.

## CONTRACTS AND ORDERS.

**Bacup Council** have given a contract to W. T. Glover and Co., Limited, for the supply and laying of 4,000 yards of cable.

**Siemens Bros'. Dynamo Works, Limited,** have been awarded the yearly contract for the supply of "Tantalum" traction lamps for Rotherham Corporation tramways.

**Salford Council** have placed contracts as subjoined:—Ferranti, Limited, three-phase to two-phase switchgear, including static transformers, £1,085; Switchgear and Cowans, Limited, regulators for above switchgear, £283 10s.

**Plymouth Tramways Committee** have accepted an offer by the contractors for the supply of clothing to the tramway employees to extend the period of the contract from one to three years, and to allow a reduction of 2½ per cent. in price.

**Halifax Tramways Committee** have allotted a contract to Bolckow Vaughan and Co., Limited, for the supply and delivery of 200 tons of steel girder rails and 7 tons of steel fishplates, at £7 per ton, subject to the rails being made in this country.

**Accrington Council** have placed contracts as appended:—Armoured cable, W. T. Glover and Co., Limited; switch panels at Clayton-le-Moors sub station and Rishton Paper Mills terminus, British Thomson-Houston Company; 250 kw. motor converter, Bruce Pebbles and Co.; one 100 k.v.a. and one 200 k.v.a. static transformer and one oil switch, British Westinghouse Company, Limited.

**Bournemouth Council** have placed a contract with W. Griffiths and Co. for reconstruction of tramways in Wimbourne Road, Charminster Road, and from Park Gates West to Poole terminus, including Thermit joints on each section, at £14,621 15s. There were seven tenders. The tender of Walter Scott, Limited, has been accepted for the supply of rails and fastenings, at £9,067 10s.

**Perth (W.A.) Council** have placed the following contracts:—Power station buildings, complete boiler house equipment and other plant, Babcock and Wilcox, Limited, £124,424; turbo-alternators, transformers, and motors, Willans and Robinson, Limited, £30,982; traction rotary converters, British Westinghouse Electric and Manufacturing Company, Limited, £9,863; condensing plant, pumps, and piping, Willans and Robinson, Limited, £23,251.

## PERSONAL.

**Mr. R. W. Willis** has resigned his position as chief assistant electrical and mechanical engineer to Swindon Corporation, in order to become principal assistant to Mr. R. A. Smith, consulting engineer, Westminster.

**Mr. W. Corin,** chief electrical engineer, New South Wales Public Works Department, is visiting Great Britain, the Continent, and America, with a view to studying bulk supply and transmission questions.

**Mr. Seckington,** traffic superintendent of the Bath road motor vehicle branch of the Bristol Tramways and Carriage Company, was presented with a silver cigarette case, suitably inscribed, by the passengers who took part in the first of the six-day tours which concluded on August 30.

**Mr. J. M. McElroy,** general manager of Manchester Corporation tramways, has just gone on a visit to the Continent to study traffic conditions, in continuation of the attention which he gave to the question during the recent visit to America. Among other places he will visit are Paris, Vienna, Berlin, and Hamburg. On his return he will make a full report to the Corporation as to methods adopted in various cities, and on the question of how best to deal with the traffic problem in Manchester.

**Mr. F. J. S. Hoskens,** general manager and engineer, Darwen Corporation tramways, is the subject of a complimentary notice in a local journal in connection with his proposal (adopted by the Tramways Committee) for the issue of a return ticket on the Bolton Road section and a penny return dinner-hour ticket on all sections to or from the Circus. The writer observes that since Mr. Hoskens was appointed to the position of manager with full control he has introduced many reforms which have worked well and been appreciated.

**Mr. Henry Mozley,** general manager of Burnley Corporation tramways, has accepted nomination to the position of vice-president of the Burnley and District Chamber of Commerce. He has also been appointed to represent that Chamber at the annual autumn meeting of the Association of Chambers of Commerce of the United

Digitized by Google

Kingdom, to be held at Antwerp on September 16 and 17. The members of the Associated Chambers will on that occasion pay visits to Ghent and Brussels, and they will be entertained by the British Chambers of those cities.

**Mr. W. Wyld,** formerly borough electrical engineer and tramways manager at Birkenhead, is to be entertained at dinner by a number of friends on October 3, at 60, Regent Street, W., to mark his appointment as chief electrical engineer to the Borough of Hampstead. Applications for tickets should be made to Mr. C. N. Russell, 29, Southwood Avenue, Highgate, or to Mr. E. P. Barfield, "Porlock," Athenæum Road, Whetstone, N. Until quite recently Mr. Wyld was a member of the Council of the Tramways and Light Railways Association.

**Bradford Tramways Committee** have received a resolution from the local branch of the Amalgamated Association of Tramway and Vehicle Workers tendering to the chairman and members their thanks for the generous manner in which the committee dealt with an application for an advance of wages for conductors and others. "It will, no doubt," states the letter in which the resolution was communicated, "give some degree of satisfaction to both the chairman and the committee to know that amid the unrest and friction that prevails at the present time on other systems the staff of the Bradford tramways are able to adjust any little difficulty without anything of the kind." Acknowledgment is also made of the unfailing courtesy and consideration with which the tramways manager (Mr. C. J. Spencer) has at all times met the men, and the hope is expressed that the better conditions of service now prevailing may result in an ever higher standard of service than that which has obtained in the past.

**Mr. C. T. Hargreaves** was killed by electric shock on August 23 at Santos, Brazil, where he was engaged with the Santos City Improvements Company. Mr. Hargreaves, who was 29 years of age, was formerly an electrician in the Blackpool tramways department.

## FINANCIAL REPORTS AND MEETINGS.

**The British Electric Traction Company.**—The receipts of all the associated companies of the British Electric Traction Company for the week ended August 29 amounted to £55,052. Upon such of the lines as were working both last year and this year the receipts show an increase of £3,384 upon the week.

**Doncaster Tramways.**—The accounts of the Doncaster Corporation for the year ended March 31 last show, with regard to the tramways, that in 1911-12 there was a deficiency of £53, the expenditure being £17,856 and the income £17,802. Last year the income was £20,347, and the expenditure £19,057, leaving a net profit of £1,290.

**Dumbarton Tramways First Dividend on Ordinary Shares.**—At the general meeting on September 1 the directors recommended a dividend on the ordinary shares for the first time of 1½ per cent. per annum on the issued and paid up ordinary share capital. A dividend on the preference shares at the rate of 6 per cent. per annum was also declared. Mr. George Balfour, the chairman, said the total receipts for the year amounted to £22,052, an increase of £578, against which increased expenses had been incurred amounting to £1,015.

**Continued Progress at Preston.**—The annual accounts of the Corporation tramways show an increase of £2,609 on the traffic receipts as compared with the previous year, in which those of 1911 had been exceeded by £2,581, the earnings per mile being 10.50d., as compared with 10.34d., while the working expenses per mile remained at 5.96d. The cost of repairs and maintenance (£6,263) amounted to £416 as compared with the previous year. After charging interest and sinking fund, the tramway surplus for the year is £9,023, of which £3,648 has been expended in three new cars, top decks to five others, new shelter on the Garstang Road, etc., leaving £5,374 to be carried to the reserve fund, which now stands at £36,840. The tramway sinking fund amounts to £42,091.

**Aberdeen Suburban Tramways Company.**—The half-yearly meeting of the shareholders was held on August 29. Mr. G. J. Walker, Portlethen, chairman, in moving the adoption of the report, which recommended a dividend of 2½ per cent., said the directors had had under their serious consideration the question of extending the company's operations by the working of railless trolley cars or other mechanically-propelled vehicles, and they were satisfied that the working of such vehicles would not only be profitable in itself, but would be profitable as a means of attracting fresh traffic to the company's undertaking. Mr. F. T. Garden, in seconding, said that the report was most satisfactory. He moved:—"That the shareholders of the company authorise and empower the directors to work trackless cars or other mechanically-propelled vehicles in connection with the company's undertaking." The report was adopted.

## WEEKLY TRAFFIC RETURNS.

The official traffic returns of 67 of the principal undertakings of the United Kingdom for the week ended August 30 amounted to £258,567, or £14,269 more than in the corresponding week last year, while the track mileage was 2,712, or 52 more than for the corresponding week. The receipts were at the rate of £95 6s. 10d. per track mile, an increase of £3 10s. per mile as compared with last year.

## COPPER AND ALUMINIUM MARKET.

September 5, 1913.

Messrs. Henry R. Merton and Co., Ltd., 2, Metal Exchange Buildings, Leadenhall Avenue, E.C., supply the following quotations of prices per ton:—

THE Tramway & Railway World
WITH MOTOR TRAFFIC SECTION

ESTABLISHED 1892. LONDON, SEPTEMBER 11, 1913. VOL. XXXIV.

# THE TRAMWAY SYSTEM OF SHEFFIELD.

The Annual Conference of the Municipal Tramways Association is this year to be held in Sheffield, a most appropriate place for the gathering of representatives of an industry which is so much dependent on steel. Before the end of the present month the Conference will have run its course, and its members will have dispersed to their homes wiser from the papers and the discussions and from the opportunities of seeing the processes of steel manufacture. They will also be wiser from their examination of the highly efficient tramway system of the city, which is conducted with so much success in conditions which present more than average difficulties. The financial success of the undertaking is also of special interest from the fact that Sheffield is the largest city which has adopted the fare of a penny all the way within the city boundary, and found it a striking success. It has been our custom in past years to present to readers of this journal shortly before each Annual Conference a description of the tramway system of the city or town in which the Conference is about to be held, and the description has included not only the engineering data but also particulars as to maintenance work, traffic arrangements, the financial results of the undertaking, and so forth. Following out the same useful practice, we are now enabled to publish the following article, which it is hoped may both assist the members of the Conference and also interest tramway men generally.

The centre of the steel industry was created a city in 1893, and the title of Lord Mayor was conferred on the then and all subsequent Mayors in 1897. The population of the city is now in round figures half a million, the rateable value is £2,000,000, the municipal debt £9,500,000, and the area 24,347 acres.

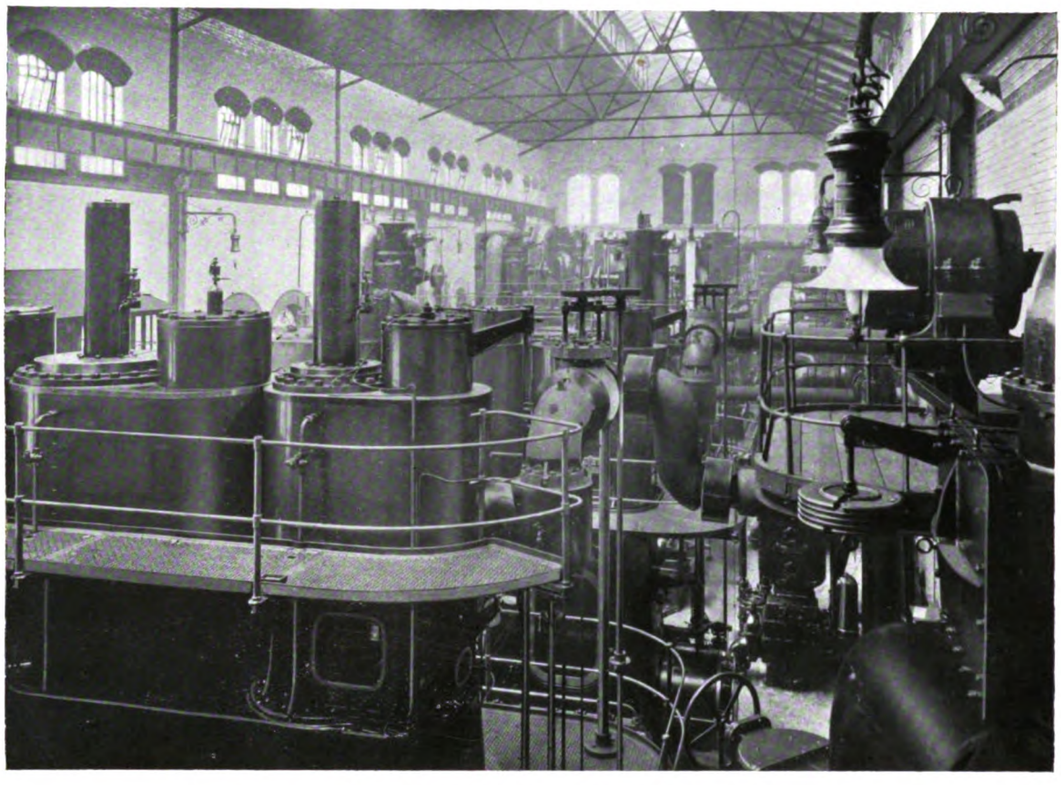
Fitzalan Square, Sheffield; Tramway Shelter on Left.

## HISTORICAL.

The Sheffield tramways were first constructed under the Sheffield Tramways Act which was passed in July, 1872, and the original length was about nine miles of double line divided into five sections. This Act was promoted by a company, prominent members of which were Daniel Busby and William Turton. A clause was inserted in the Act to the effect that the Corporation might, within a period of two months after the passing of the Act, elect to be substituted in the place

Digitized by Google

of the company for the purposes of the Act. A further clause gave the Corporation power to lease the tramways to a company.



General View of Engine Room.

Power-Station Switchboard, Showing Generator and Feeder Panels.

After the passing of the Act the Corporation, by special resolution, decided to substitute themselves in place of the company. They constructed the tramways and leased them to the company, the Corporation thus becoming one of the first municipalities to own their tramways.

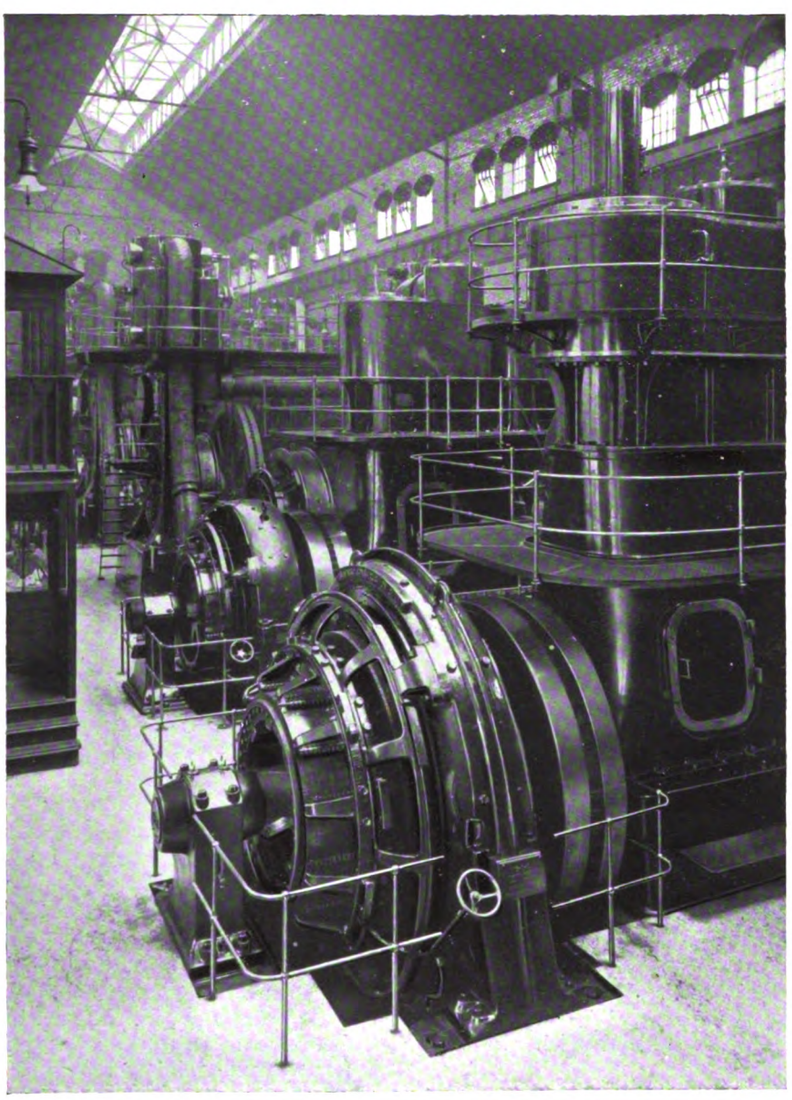
The first section was opened for work in October, 1873, and the lines were leased to the Sheffield Tramway Company for a term expiring on July 10, 1896.

Digitized by Google

The company kept the track in repair, paid a rental of £100 per mile of route per annum, and fulfilled other conditions. These routes continued to be worked by horse traction by the Sheffield Tramway Company up to the expiration of the lease, when the Corporation commenced to work them as a municipal undertaking from July 11, 1896.

The Corporation paid the sum of £27,500 for the various properties which they took over from the company, electrified the existing tramway routes, and commenced electric traction on September 5, 1899. Since that date other routes and extensions have been constructed under various Acts of Parliament which have been obtained from time to time by the Corporation, and at the present time the Sheffield tramway system has open for traffic over 40 route miles.

In the Parliamentary session of 1912, the Corporation promoted a bill which gave powers for the construction of further six miles of tramway extensions, some of which are now under construction. The same Act also authorised the provision and working of trackless trolley vehicles, but so far it has not been suggested that this type of vehicle should be put into operation. Before leaving the historical part of the subject, it should be noted that penny fares were introduced in October, 1902, and that horse traction was finally abolished in the following month.



Main Engines and Generators

#### POWER-STATION.

Sheffield is one of those towns, comparatively few in number, which have a tramway power-station independent of those for supplying energy for lighting and miscellaneous power purposes, but work is now in hand for connecting the tramway generating station with the electric supply station at Neepsend, from which it is intended to take part of the energy required for the tramways. The tramway station is situated at Kelham Island, which is a point approximately as near to the centre of the tramway system as could be obtained. In addition to its central position the station has also the advantage of a supply of water for condensing purposes. The site is of a peculiar shape and the buildings, which are of brick, had to be designed to suit it.

Though erected 14 years ago the principle of induced draught was adopted, so that the boiler house chimneys, which are of steel, are only 80 ft. high. The boiler house contains 13 boilers, four of which are of the marine wet-back type and nine are of the water-tube make. They vary in evaporative capacity from 9,000 lb. of water per hour to 32,000 lb., the total being over 184,000 lb. All the Stirling boilers are fitted with chain-grate stokers, and the marine type boilers, which are supplied by John Brown and Company and Davy Brothers, are fitted with Bennis stokers. They all work on the induced-draught system, and the fans for the purpose are motor-driven. The boiler superheaters are of the Stirling make.

The complete coal and ash conveying plant on the push-plate principle, capable of dealing with 50 tons of coal and 5 tons of ashes per hour, was erected by Walton and Clough, together with a reinforced concrete coal bunker of about 850 tons capacity.

The coal is delivered to the boiler house by carts, and consists of washed nuts, the average price of which at present is about 13s. 4d. per ton. The feed-water pumps are of Weir and Hall make. The steam is conveyed from the boilers by one main header, the piping having been supplied by Aiton and Company and Spencer. The condensing plant consists of three Wheeler condensers (one of 1,900 sq. ft. and two of 3,400 sq. ft.), one Allen condenser of 3,000 sq. ft., and one British Westinghouse condenser of 5,000 sq. ft. cooling surface. The feed-water heater employed was also supplied by the Wheeler Condenser Company. The make-up water for the boilers is obtained from the town supply, while the circulating water for the condensers comes from the river.

The engine room started originally with three 300 H.P. engines, but it has been extended until now the following seven units are installed:

One Browett and Lindley vertical triple expansion engine of 2,000 H.P., coupled to a 1,500-KW. Electric Construction Company's generator.

One Browett and Lindley vertical triple expansion engine of 1,450 H.P., coupled to a 1,000-KW. Vickers' generator.

Digitized by Google

Two Cole, Marchent, and Morley vertical cross-compound engines of 1,450 H.P. each, coupled to 1,000-KW. British Thomson-Houston generators.

Two Cole, Marchent, and Morley vertical cross-compound engines of 750 H.P. each, coupled to 500-KW. British Thomson-Houston generators.

One of the original 300-H.P. Allis horizontal engines, coupled to a 225-KW. British Thomson-Houston generator.

The present total horse-power is 8,150, and the total capacity of the generators 5,725 KW. The steam pressure employed is 165 lb. per sq. in., and the consumption is about 13 lb. per indicated horse-power-hour. The engine room is spanned by a crane of 25 tons capacity. All the generators are of the multipolar direct-current type, compound wound, and produce current at a pressure of from 580 to 600 volts. The combined efficiency of engines and generators is from 86 to 87 per cent.

A negative booster of 45 KW. capacity, supplied by Ernest Scott and Mountain, was installed in 1903, and two of 45 KW. each have been installed by the Electric Construction Company this year. All switchboards have marble panels, and are fitted with the usual instruments.

In connection with the supply of energy to be taken by the tramways department from the electric supply station at Neepsend, two 1,500-KW. rotary converters, with transformers, switch gear, etc., are now being constructed, and will be housed in a new building adjoining the tramway power-station. The in-coming cables will supply current at 11,200 volts, and this will be transformed and converted to 600-volt direct-current supplied to the main station bus-bars.

Two electrical oil-eliminating plants are installed, both manufactured by Davis Perrett Ltd., with a combined capacity of 15,000 gallons per hour. Owing to trouble with leaves and debris in the circulating water supply from the Kelham Goit or mill race, the Corporation have recently installed a patent drum type rotary water strainer of 500,000 gallons per hour capacity. In view of the narrow width and depth of roadway to the Kelham power-station and the very limited space for cable ducts required for extensions, the Corporation in 1903 obtained power to construct a tunnel under the Kelham Goit. The tunnel is built of cast iron segments bolted together and embedded in concrete which is 1 ft. in thickness at the top and sides and 2 ft. 6 in. thick under the tunnel. Its length is 110 ft., inside width 5 ft., and the maximum headway 7 ft. 4 in. The cast-iron top of the tunnel is 3 ft. below the bed of the Goit.

### FEEDER SYSTEM.

The general arrangement of the feeder system is that of main feeders with graded distributors. The total number of feeder cables is 25, and they are of an average sectional area of ·75 sq. in. The cables, which have principally been supplied by Glover and Company, are paper insulated, laid in earthenware and fibre ducts. The feeder points are spaced every half-mile along the routes, and the cables are divided into sections, varying from 1 sq. in. to ·3 sq. in. The distance from the power-station to the nearest feeding point or track is 1,000 yards. The average and maximum drop on the feeders are respectively 3 volts and 5 volts. The insulated return feeders vary from 1 sq. in. to ·6 sq. in. in section.

A complete private system of telephones is installed, connecting the head office, the power station, car sheds and all feeder pillars by underground wires.

Fitzalan Square Terminus.

### PERMANENT WAY.

The total route length of the tramway system is 40 miles 1 furlong 150 yards, exclusive of tracks in car sheds and those forming shed approaches. Out of this, 37 miles 5 furlongs 53 yards is double track, and 2 miles 4 furlongs 52 yards is single, giving a total length of single track of 77 miles 2 furlongs 158 yards. A notable feature of the system is that there are many gradients, both long and steep. The vehicular traffic along the streets is exceptionally heavy, not only as to

Digitized by Google

Digitized by Google

Digitized by Google

the number of vehicles, but also as regards the weight of the loads. There are only one or two level crossings over railways, but there are a great many overhead railway bridges. The height of some of these above the street surface is only about 14 ft., so that on these routes only single-deck cars can be used. Single-deck cars are also employed on routes which include some of the steepest gradients. The maximum gradient on the whole system is in Nether Green Road, where for a distance of 100 ft. there is a slope of 1 in 9·3. Curves are fairly numerous, and the radius of the sharpest is 35 ft. The narrowest width of street in which the tramways are laid is 28 ft. 9 in., in South Road. The streets over all are not conspicuous for width, so that the total length of streets where the near rail is less than 9 ft. 6 in. from the footpath kerb is about 22 miles.

The tracks are of standard gauge and the rail employed is a modified B.S.S., No. 5, with the standard head, a thick web, and a 6-in. flange. The weight is 120 lb. per yard, and the rails are in lengths of 60 ft. The detail dimensions are: Depth, 7 in.; width of base 6 in.; width of head, $3\frac{31}{32}$ in.; width of groove, $1\frac{1}{8}$ in.; depth of groove, $1\frac{1}{8}$ in. The rails as now laid are of Sandberg high silicon steel, and were manufactured by Steel, Peech, and Tozer, Rotherham. The rails are drilled with bond holes $\frac{13}{16}$ in. in diameter. The fish plates, which are of acid Bessemer steel, weigh $56\frac{1}{2}$ lb. per pair, and are of British standard No. 5 type. There are six bolt holes 1 in. in diameter and rymered out for taper bolts. These bolts are driven in and fastened with lock nuts. The taper is from 1 in. in diameter to $1\frac{7}{32}$ in. in a length of $2\frac{3}{16}$ in. No sole plates are employed. The tie bars are of wrought iron, spaced 10 ft. apart, and are 2 in. broad by $\frac{3}{8}$ in. thick. They are secured by square nuts and washers on each side of the rail web. Drain rails are not employed.

The points have been made by Hadfield's Steel Foundry Company, Edgar Allen and Company, and Osborn and Company. Like the crossings, they are constructed of manganese steel, and this metal has also been used for the rails on several curves. The Thermit system of track welding has been employed on $6\frac{1}{2}$ miles of street, giving 11·4 miles of single track, and it is now standard practice in Sheffield. The approximate cost per joint has been £1 7s.

*Sub-structure.*—In laying the track the roadway is excavated and the rails laid and supported at the correct level; concrete is then filled in, there being 6 in. below the rail, and it is also carried up an inch above the flange of the rail. Intermediate anchors are attached to the rail about every five yards, and one is usually placed a foot away from the Thermit weld on the leading rail. The depth of excavation of the roadway for the concrete is 13 in., and the concrete used is of six to one composition. The paving consists of granite, wood, and patent paving. The granite setts partly consist of 4 in. cubes and partly of setts measuring 5 in. by 3 in. Where wood is employed the size of the blocks is 9 in. by 5 in. by 3 in. The setts are paved on a bedding of slag and tar, and grouted with pitch and tar. The wood pavement is laid on a concrete floating and grouted part of the way up with pitch and tar, and finished with cement grouting. Fully two miles double track have been constructed with longitudinal sleepers of creosoted red wood, 7 in. broad, $4\frac{1}{2}$ in. thick, and in 12 to 18 ft. lengths. The total cost of construction of the track per single mile has been about £7,200, and the work is carried out by the Corporation through the direct employment of labour.

*Bonding.*—Crown solid bonds are used, those for the fish joints being double, and 32 in. long, while those for the welded joints are single and 14 in. long. The

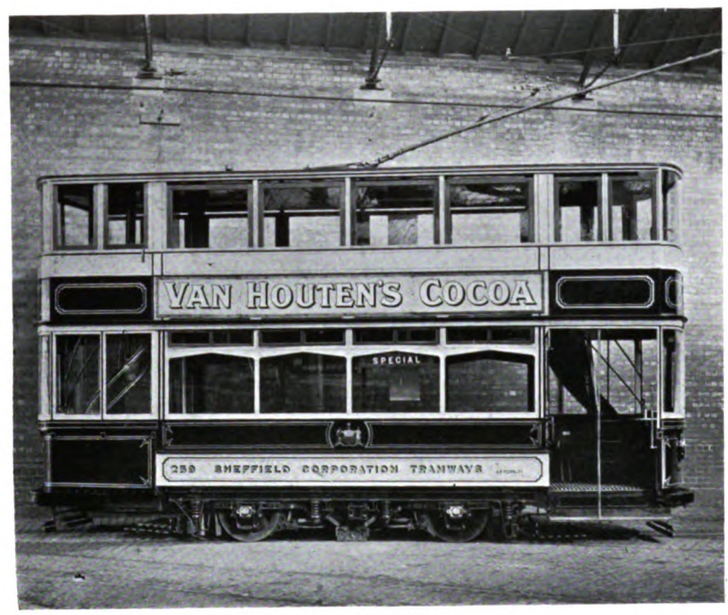
**View at Moorhead—Tramway Shelter on Right.**

Digitized by Google

gauge is 4/0 B. and S. The sectional area of each bond is ·166 sq. in., and the conductivity is 98 per cent. of that of the rail. The cross bonds are of the same gauge, and are spaced 40 yards apart.

### OVERHEAD EQUIPMENT.

In regard to the overhead equipment, it is now principally on the span-wire system, with swivelling trolley head. The greatest out-reach laterally of the trolley arm is about 5 ft., but on the average the wire provides for practically centre running. Double wires are employed throughout of 2/0 gauge; some are of copper and others are bronze and phono-electric. The conductivity of the copper wire is of 100 per cent., and that of the bronze 51 per cent. The breaking strain is 34 tons per sq. in. As usual, the wires are divided up into half-mile sections. They have chiefly been provided by the British Insulated and Helsby Cables, and the Equipment and Engineering Company. The span wires are of 7/12, and the guard wires of 7/16. The poles, which are spaced from 90 ft. to 100 ft. apart, are of three weights, all according to the British standards for steel tube poles. The suspension is flexible, and has been made by the tramway department. The brackets are of wrought iron with cast-iron clips. In some places wall rosettes are used in-tead of poles, and these are of malleable iron with rubber silencers.



Side View of Vestibuled Car.

### ROLLING STOCK.

The number of passenger cars engaged in working the tramways at present is 287, and the total number of all classes of tramway vehicles is 303. The latter figure is made up as follows:

| | |
|---|---|
| Covered double-deck cars | 219 |
| Ordinary double-deck cars | 7 |
| Single-deck cars | 53 |
| Stores vehicles, etc. | 16 |
| Double-deck omnibuses | 5 |
| Single-deck omnibuses | 3 |
| Total | 303 |

The cars which were purchased in the early days of electric traction were fitted with two 20-H.P. motors, and the second hundred purchased were fitted with two 27-H.P. motors. Both these types of motors have since been found too slow for modern requirements, and with few exceptions the 20-H.P. and the 27-H.P. motors have been replaced with 37 or 40-H.P. motors, which are much faster and also better able to cope with the larger top-covered cars which are now used in the service.

The extended canopy cars (with

Standard Double-Deck Vestibule Car and Car of Old Type now being Converted to Standard.

Digitized by Google

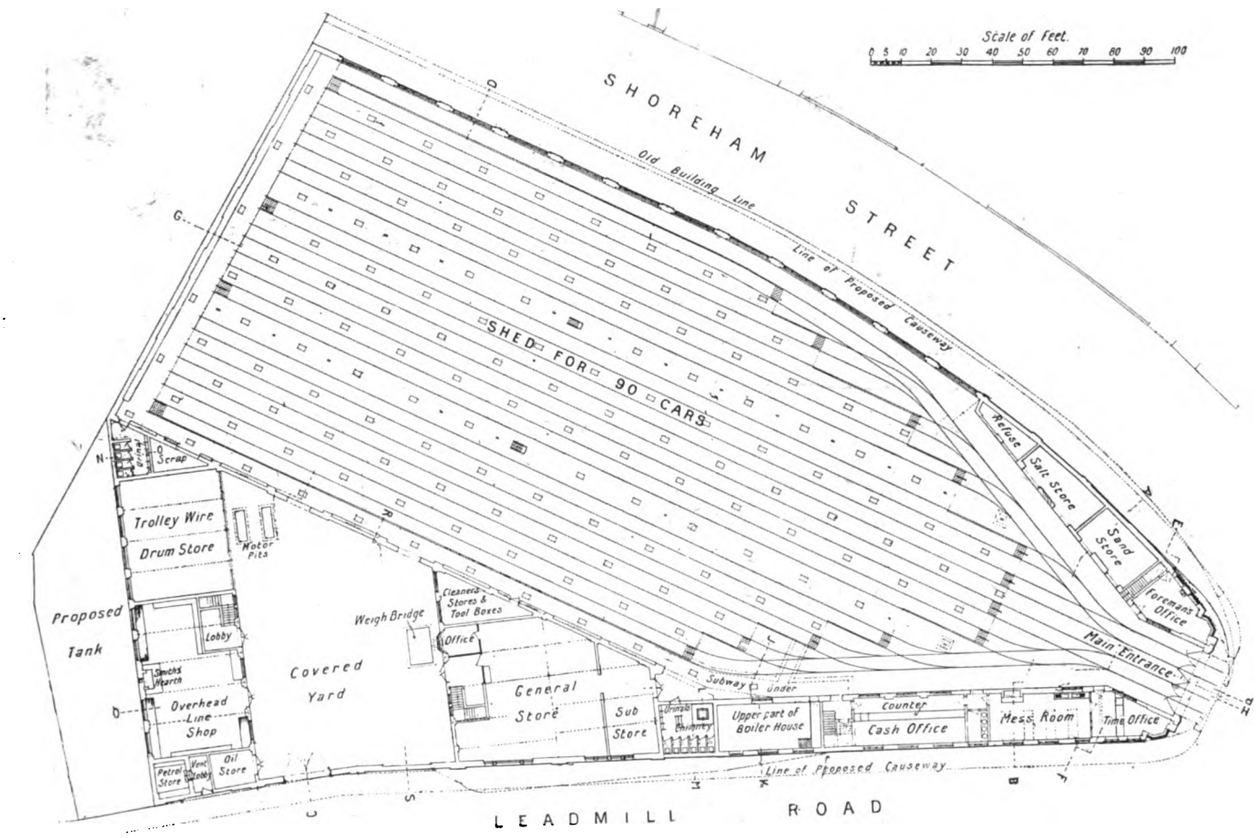
four outside seats at each end of the top deck) which are being constructed cost approximately £730 each and weigh about 11 tons.

The old type of short-ended cars with steep staircases and small platforms is gradually being converted into the more modern type of car. This is an expensive matter, but the committee put efficiency in rolling stock in the fore-front and do not hesitate to spend the necessary money in work of this description, which however will take a considerable time to complete.

During the past five years an average of 25 new tops have been constructed in the Corporation workshops each year, and all the cars have been fitted with covers. An additional 50 cars are now being constructed by the Brush Company, all with vestibule ends.

Coming to technical details of the rolling stock, the cars have been supplied by various makers, including Milnes and Company, the Brush Electrical and Engineering Company, Cravens, Limited, and the United Electric Car Company. Single trucks, some of the radial variety, are used, the makers being Milnes and Company, the Peckham Truck Company, the J. G. Brill Company, the Brush Company, Mountain and Gibson, and the British Radial Axle Cars, Limited. The weight of the double-deck cars, completely equipped, is from 10 tons to 12½ tons, and of the single-deck cars 8 tons 7 cwts. The wheel base for the radial trucks is 8 ft. 6 in., and for the rigid trucks 6 ft. 6 in. The spring base is 15 ft. The wheels have cast-steel centres, and the tyres are of acid open-hearth steel. The diameter of the wheels on flange is 32¾ in., and that of the axles 4¼ in. The axles were made by T. Firth and Sons, and the tyres by John Brown and Company and Brown Bayley's Steel Works. Some of the double-deck cars are 31 ft. 10 in. long over all, while others are 29 ft. 4 in. The single-deck cars all measure 31 ft. 4 in. All cars are 7 ft. 3 in. wide over all, 6 ft. wide at floor sills, and 6 ft. 6 in. high inside from the floor to the centre of the ceiling. The double-deck cars seat, according to the size, from 30 to 40 passengers outside and from 22 to 28 inside, giving a total of 52 and 68 respectively. The single-deck cars seat 28 passengers. All are fitted with hand-slipper, rheostatic, and mechanical track brakes, the latter having poplar wood blocks. The collision fenders are of steel, 6 in. by 3 in. by ·375 in., and the draw-bar sockets are of wrought iron. The life-guards are of the National Railway improved type, and John Taylor's and "Common Sense" forms of pedal sand boxes are used. The double-deck cars have from 20 to 25 lights each, and the single-deck 15. No oil lamps are provided.

In regard to the electrical equipment of the cars, each has two motors, and the following types are used: G.E.-52 (5-turn), G.E.-58 (4-turn), and R.G.E.-20. The G.E.-52 motor is of 27 H.P., the G.E.-58 of 37½ H.P., and the R.G.E.-20 40 H.P. All were supplied by the British Thomson-Houston Company. The same makers fitted the controllers of their B.-6 and B.-13 types. The motors are geared to the car axles by cast-steel pinions meshing into cast-steel axle gears. The trolleys are of the B.M. and R. flat base type.



**Plan of Shoreham Street Car Depot.**

#### CAR SHEDS.

There are four car sheds, namely, Tinsley and Hillsborough in the north, and Queen's Road and Shoreham Street in the south. They provide accommodation for 340 cars. The Hillsborough shed (now under reconstruction) and the Tinsley shed were the original depots used by the Sheffield Tramway Company. The former is two and the latter three miles from the centre of the city.

The latest depot built is the one at Shoreham Street, which can store 110 cars, and provides office accommodation, lavatories, mess rooms, and stores, including

Digitized by Google

clothing stores where all the uniforms and other articles of clothing are delivered, and where a staff of tailors is constantly employed carrying out the repairs to employees' uniforms with the aid of electrically driven machines. There is also a large garage for the motor vehicles operated by the department, together with overhead line stores and workshops.

This Shoreham Street depot was opened in February, 1911, and it immediately proved a great convenience from its central situation, as other car-sheds were near the outer termini of the tramways. The Shoreham Street depot is only a short distance from Fitzalan Square, the city terminus of several tramway routes, and the principal centre of the whole system. The site comprises 6,315 square yards, and the land has been taken on a lease for 200 years. The structure, which is well built and carefully designed, cost about £27,500.

supplied with hot water for car washing and other purposes. The floor of the main shed, including the inspection pits and subways, as well as the gangways above, is constructed of reinforced concrete. The spacious mess rooms for the men have boarded floors of maple, and are provided with ranges and other convenient arrangements for the comfort of the men.

#### REPAIR SHOPS.

The car repair works and machine shops, together with the woodworking and car building shops, are situated at the Queen's Road depot, which is about two miles from the centre of the city. Two hundred men and boys are employed in these shops. It is only recently that it has been possible to centralise these shops; previously they were distributed at the various depots. The present arrangement is a vast improve-

**Interior of Shoreham Street Car Depot, Showing Arrangement of Tracks and Galleries.**

The main entrance is on a central axis with two running tracks branching out into twelve storage tracks, with an inspection pit extending clear across the tracks and making it possible for men to pass from track to track without ascending to the main floor. The work of the cleaners is expedited by the placing of galleries along both sides of each track at the level of the upper deck of the cars. These galleries are suspended from the roof, and produce no obstruction. The offices, men's mess rooms, etc., adjoin the main shed, and are situated over the entrance and in a two storey block fronting to Leadmill Road, with a boiler house and fuel storage in the basement. The remainder of the site fronting Leadmill Road, covering an area of about 1,300 square yards, contains a large covered yard for motor garage and overhead line head-quarters, and two double-storied buildings for general stores, workshops, etc. The whole of the building is heated by low-pressure steam and

ment and tends to economical and efficient supervision and working. The staff at these works is made up as follows:

*Day Staff:*

| | |
|---|---|
| Foremen, timekeepers, storekeepers, and clerks .. | 13 |
| Overhaul fitters .. .. .. .. .. .. | 12 |

### TRAFFIC ARRANGEMENTS.

The following are the scales of wages for traffic employees:

*Motormen*:
6¾d. per hour on joining.
7¼d. „ „ after six months.
7½d. „ „ after further six months.
Rates up to 8·2d. per hour are paid for certain hilly routes.
In addition, motormen are granted merit badges on completion of seven and 12 years' approved service, each badge entitling the wearer to an additional 1s. per week in wages.

*Conductor*:
5·8d. per hour on joining.
6d. „ „ after 12 months.
6¼d. „ „ on completion of 18 months' approved service.

Billiard Room at Employees' Club.

Uniform Men's Mess Room at Central Depot.

Reading Room at Employees' Club.

Tailors' Shop at Car Depot.

Merit badges are granted on completion of two, four, and seven years' approved service, each badge entitling the wearer to an additional 1s. per week in wages.

*Inspectors*:
£2 0s. per week on appointment.
£2 2s. „ „ at the end of five years' service.
£2 4s. „ „ on completion of 10 years' approved service.

Time and a quarter is the minimum rate of pay for all employees for Sunday work.

The arrangements for the running of the cars, making out time-tables, duties of motormen and conductors, timekeepers, rail and point cleaners, inspectors, etc., are in the hands of the traffic branch, which is under the control of the traffic superintendent (Mr. Handford) and his assistant (Mr. Wilson). The average number of cars working each day now approximates 211. The car working day is divided into two parts in such a way as to give two shifts of men engaged on the whole-day cars as nearly as possible an equal number of hours per day. The first car out of a depot in the morning leaves Tinsley at 4-15 a.m. for the city, and the last car arrives in at night at 1-0 a.m. The average interval between cars is five minutes, and the busiest time of the day is from 8-20 to 8-50 a.m. The fixed stopping places are about a furlong apart, and are shown by indicator plates and special painting of poles. While the maximum speed allowed for the cars is 16 miles per hour, the average speed, including stops, is 7·372 miles per hour. The general fare is a penny, but there are halfpenny stages. The longest through route is from Market Side to Firth Park, three miles 1,540 yards, and for this the fare is a penny. The average fare per mile works out at ·386d.

The employees have a club conveniently situated in the centre of the city, at which they can obtain their meals at cost price, and where there are also a reading room, billiard and bagatelle tables, etc. The men pay a subscription of 6d. per month, and in addition to receiving the benefits of the club itself there is an organised Hospital and Benevolent Fund which makes grants from time to time to members who have been off sick for a certain number of weeks and are in need of financial assistance. The rent of the premises, together with rates, etc., are paid by the club, but the Tramways Committee pay the wages of the employees in the club, amunoting to approximately £570 per annum.

### THROUGH-RUNNING ARRANGEMENTS.

Through tramway traffic with Rotherham was commenced on September 11, 1905, and the result of coupling up the two tracks has been beneficial to both tramways. The arrangement between the two Corporations is a very simple one, and provides that all fares taken within the old city boundary of Sheffield—no matter on whose cars—are the property of the Sheffield Corporation, and all fares taken outside the old city boundary are the property of the Rotherham Corporation. The total number of through passengers carried last year was 908,432.

### LOST PROPERTY.

Lost property also entails considerable work for the traffic staff. For the twelve months ended March 25, 1913, 11,684 articles were handed in as left behind by passengers, and the detailed list of these articles is an astonishing one. For instance there were:

2,855 parcels, handbags, and baskets.
1,454 gloves and aprons.
1,072 umbrellas.
730 purses and satchels.
1,002 passengers' change and money.
405 articles of wearing apparel.

### CASH AND TICKET DEPARTMENT.

Sixteen female assistants are employed in the ticket and bell punch office, where there is an average stock of 20 million tickets. In connection with the cashiers' work, there are nine cash clerks employed every evening at the depots taking in the receipts from the conductors when they have finished duty.

The average traffic receipts in Sheffield now amount to £7,500 weekly, and it may be of interest to point out that included in this amount is 4¼ tons of copper coins (which equal about £1,700 weekly, and consist roughly of half a million pennies and half-pennies) 20,000 sixpences, 8,000 threepenny pieces, 28,000 celluloid tokens, and the remainder the usual silver coins. The copper is packed in 5s. rolls. The tramway department is considered by all the banks and large business firms in the city to be the copper exchange for Sheffield and district.

### ACCIDENTS.

A very small but necessary branch of the staff is engaged in dealing with accident reports, and with claims that arise therefrom. A strict rule in the department is to the effect that all accidents of every description, no matter how trivial, which occur to passengers, or in connection with the working of the cars, must be fully reported by the employees in charge of the cars. By far the greater majority of the accidents are entirely owing to passengers and intending passengers, particularly the ladies, persisting in entering

View of Tramway Offices.

Omnibus Garage at Central Car Depot.

Digitized by Google

and leaving cars in motion. Recently a considerable improvement has been brought about in this direction by the system of taking a proportion of the fares of top-deck passengers on the platforms, and instructing the motormen and conductors that they are to prevent ladies leaving the cars which are in motion, as it was found that the ordinary warning was not enough, and seldom taken with sufficient seriousness.

In regard to the claims for compensation, and the amounts which are paid by the Sheffield Tramways for accidents and damage of all description, these are probably the lowest for any large tramway in Great Britain.

### THE TRAMWAY OFFICES.

The tramway offices are housed in a handsome building in Division Street, covering 7,180 sq. ft. They were originally erected by the Sheffield Waterworks Company in 1870, an undertaking now absorbed by the Corporation. The offices are situated within one minute's walk of the Town Hall, and conveniently near two tramway routes. They are well lighted and spacious, and the accommodation is ample. The general manager's and electrical engineer's private offices occupy the front rooms, facing Division Street, where there is the general entrance. Separate accommodation is provided on the ground floor for the general clerical and accountant's staff in the traffic department. There is abundant accommodation on the second floor, where the ticket department is situated. All the rooms are heated by high-pressure hot water, and lighted by electricity. For the traffic department there is a room 41 ft. long by 36 ft. wide, where inspectors, motormen, and conductors sign on for duty. Substantial provision is made for cash clerks and payment of wages.

### FINANCIAL.

In regard to financial results, the policy of the committee and Council has been one that does not tend to produce so large a profit as on a number of other systems of similar size, but notwithstanding this, whilst an annual contribution of about £30,000 is now made in relief of rates, considerable sums are annually distributed in various forms in such ways as assisting the Sheffield University, providing music, concerts, and illuminations in the parks; contribution to Rifle Association, grant to Cutlers' Company (for protection of trade name of city), grant for provision of holiday for poor children, etc. These contributions are made under clause 65 of the old Act of 1872, which states, (after making certain other provisions) "that the balance shall be applied by the Corporation in payment of any charges or expenses for the time being payable out of the borough fund or borough rates leviable by the Corporation, or otherwise for the public benefit of the inhabitants of the borough, and for the improvement of the borough."

A table showing the financial history of the undertaking is annexed. It will be seen that the total capital expenditure at the latest date was nearly a million and a half, and that over £400,000 of this has been repaid.

### MOTOR OMNIBUS SERVICES.

During the past few months, the Tramways Committee have made a new departure by instituting four services of motor omnibuses, the powers for running which they obtained under the Sheffield Corporation Act, 1907. The vehicles are all of the 40 H.P. Daimler type with silent Knight engines, and fitted with electric lighting sets, chain-driven gear boxes, and Continental tyres. The carrying capacity of the double-deck omnibuses is 36, and that of the single-deck omnibuses 27, in each case including two passengers alongside the driver.

The 'buses have been in service since the beginning of February, and up to the present have run about 95,000 miles and given a very satisfactory service. Further orders are being placed for additional 'buses for other routes. The gradients on which the 'buses are working are fairly steep, in one case being as much as 1 in 12 for a length of approximately 100 yards.

On Sundays an eight-minute service is maintained on one route, which branches out into the country a distance of three miles from the tramway route, and on fine days the traffic is so heavy that a five-minute service would not be too much for the number of passengers who desire to avail themselves of the opportunity of getting out into the country districts. The single-deck 'buses are used on a route where there are two low railway bridges, which prohibit the use of either double-deck tramcars or double-deck 'buses.

The Education Department have taken advantage of the provision of the 'buses by making arrangements with the Tramways Committee for the conveyance of children each morning out to the open-air school, which is situated some five miles from the centre of the city, a journey which previously had to be made partly by tramcar and partly by horse wagonette.

It is too early yet to give any reliable figures regarding working expenses, but it will be interesting to see these worked out on the standard adopted by the municipalities, and in a somewhat similar way to the standard form of tramway accounts.

**Single and Double-Deck Omnibuses.**

#### THE TRAMWAYS COMMITTEE.

The following are the members of the present Tramways Committee:

The Lord Mayor (S. Osborn, Esq., J.P.)
Chairman: Alderman Sir William E. Clegg, LL.D., J.P.
Deputy-Chairman: Councillor A. T. Bescoby, J.P.

| | |
|---|---|
| Alderman C. F. Bennett. | Councillor W. Bakewell. |
| Alderman H. Hughes, C.B., C.M.G., LL.D., J.P. | Councillor C. Barker. |
| | Councillor J. W. Crowther. |
| Alderman J. Knowles, J.P. | Councillor T. G. Evans. |
| Alderman Sir C. T. Skelton, J.P. | Councillor R. Holmshaw, J.P. |
| Alderman J. R. Wheatley, J.P. | Councillor J. Peck. |
| Councillor A. J. Bailey, J.P. | Councillor S. Walker, J.P. |

Of the present Tramways Committee the only two members who were on the original committee formed in 1896, are the chairman, Alderman Sir William Clegg (who has been chairman from the commencement) and Alderman J. R. Wheatley.

Mr. A. R. Fearnley took over the management of the tramways in December, 1903, succeeding Mr. A. L. C. Fell, who had occupied that position from the commencement, and who left Sheffield to become chief officer of the London County Council Tramways. Mr. H. E. Yerbury, M.Inst.C.E., is the chief electrical engineer.

## NOTTS. AND DERBYSHIRE TRAMWAYS.

The newly-constructed tramways undertaking of the Nottinghamshire and Derbyshire Tramways Light and Power Company was partially opened for traffic on August 7, after inspection by Lieut.-Col. Druitt, of the Board of Trade. The portion then inspected and passed was from Heanor to Cinder Hill. On August 15 the Ripley to Crosshill section was inspected by Colonel Druitt, and was subsequently opened to the public, thus completing the tramways. The system, which is to link up with the Nottingham Corporation Tramways, is 13¾ miles in length. The power-station is at Ilkeston. Messrs. Balfour, Beatty, and Company were the contractors. A good deal of road widening has been necessary, as well as some displacement of gas and water mains, while two canal bridges have had to be strengthened. The new line brings such populous districts as Codnor, Heanor, Langley Mill, Eastwood, and Kimberley into touch with Nottingham. The decoration of the cars is in pale yellow and green, picked out with gold.

Since the Nottinghamshire and Derbyshire Tramways Company was formed, the whole of their issued shares and debenture scrip have been acquired by the Tramways, Light, and Power Company, Limited, of 22a, College Hill, Cannon Street, E.C. The company have various powers for the construction of tramways in the counties of Nottingham and Derbyshire and the city of Nottingham, and running powers over certain of the Nottingham Corporation tramways. The directors of the company are the Right Hon. Viscount Chilston, Mr. A. A. Holland, and Mr. George Balfour; the secretary is Mr W. Bryden.

**Tramwaymen and the Territorial Force.**—Manchester has achieved a measure of fame in the way of its large proportion of tramwaymen who serve in the Territorial Force. A hundred men in August concluded their annual training

## CORRESPONDENCE.

### The Rating of Tramways.

To the Editor of the Tramway and Railway World.

Sir,—Amongst the commercial undertakings brought into existence by the Legislature, there is not one which has received so much discouragement and encountered so much general antagonism as the tramway industry, but there is not one which can lay better claim to public consideration and support, because of the great benefit conferred upon the travelling public and more particularly on the working population.

The unfortunate decision of the House of Lords in the Tottenham rating case is, therefore, a matter of great interest to the public as well as to the tramway undertaker. It is of great interest to the tramway world, because for once we appear to be able to follow the grounds on which the decision was based. It must be borne in mind that it is a complete reversal of the unanimous decision of a strong Court of Appeal, and seems to be in disregard of the broad general principles to be found in the judgment of Lord MacNaghten in the previous decision of the House of Lords in the Blackpool case. Out of respect alone for the views of these eminent lawyers one would have thought that none of the Lords of Appeal in the present case would have made inaccurate statements in order to assist them to arrive at a new decision, nor have made perfectly unnecessary statements, which indicate either an insufficient knowledge or an inaccurate appreciation of legislative history.

I am desirous, by your courtesy, with all due respect, of passing a few criticisms on the judgment of Lord Moulton. The whole judgment strikes one as being more of a defence of personal views and opinions than a lucid exposition of the problem under review which the importance of the issue demanded.

Lord Moulton suggests that because the streets provide the support for tramway rails, because the pavements provide a platform for the use of passengers, and because the streets are lighted, therefore tramways are not to be treated as railways. But he omitted to mention and apparently did not appreciate that for the privilege of laying a railway in a street a large portion of the street must be maintained by the tramway undertaker, and also that more often than not considerable sums are required to be spent in making widenings and carrying out improvements in the streets which the road authority, in discharge of its duties, has not provided, but takes the opportunity of imposing upon the tramway undertaker.

Moreover, the streets are lighted alike for all classes of traffic, and a tramway probably needs less public lighting than any other form of traffic.

Incidentally in many cases the tramway undertaker is also required to light the streets for the benefit of the public at his own expense.

Lord Moulton's uncalled-for criticism of the working of the Light Railways Act is not only unfortunate, but inaccurate in the extreme, and leads one to speculate whether or not he deemed his position so hardly pressed that in enforcing his personal views he felt light railways constructed in the streets (in other words tramways) clearly showed the inconsistency of such views.

As a member of Mr. Bryce's Committee on Light Railways in 1894, on whose report the Light Railways Act was brought into existence, I was astonished when I read Lord Moulton's views on what he thought it properly included.

I should, failing other evidence, have had no hesitation in joining issue with Lord Moulton on my own knowledge of the scope of the legislation recommended by that Committee, but I prefer to stand by the Parliamentary debate when the Light Railways Act was introduced.

Earl Dudley, in introducing the bill, said that it was founded on the recommendation of a Committee which sat in 1894, *i.e.*, Mr. Bryce's Committee, of which, as I have said, I was a member. The Chairman of Committees (Lord Morley) told the House of Lords: "That the bill included not merely all tramways but any railway which the Board of Trade thought might justly be brought within its scope. *It certainly included tramways in towns* and it might include large trunk lines throughout the country." He also stated that: "It would be possible, though he did not say it was probable, that under this bill the London County Council and the Oxford County Council might make a line between Oxford and London, and *it would be possible also for a company to make a tramway through the streets of London, evading all the provisions of the Tramways Acts*, without the consent of the frontagers or the local authorities, and without the precautions which were taken under the Tramways Acts for the sale of these undertakings to the local bodies." The italics are, of course, my own.

Finally, we have the provisions of the Act itself, by which any County Council or any Borough Council is enabled to obtain powers to make a light railway in its district. How this could be done in the case of a Borough Council without going along streets perhaps Lord Moulton could tell us. How can Lord Moulton therefore say, either with any sense of accurate knowledge or legal consistency, that "by what he had no hesitation in regarding as an abuse of the Act" schemes were sanctioned under the authority of the Light Railways Act for the construction of what ought to have been regarded as tramways.

It appears to me that it is impossible to find a single argument in Lord Moulton's judgment which clearly demonstrates that because rails are laid in a street under the Tramways Act, a heavier burden of rating should be put upon the owner thereof than would be the case if the same rails were laid and used in an identical position and manner, but were called a tramroad or a light railway instead of a tramway.

I am, sir, etc.,

Stephen Sellon, M.Inst.C.E.

Stephen Sellon and Partners,
36, Victoria Street, London, S.W.,
*August 30, 1913.*

**Luggage Trailers.**—There is a suggestion that the Birmingham Corporation should follow the example of Dresden and put trailers on some of the tramcars for the purpose of carrying luggage. The idea has already been considered, but the matter will require much investigation before it can be put in practice.

**New Electrical Station at Glasgow.**—The City Council have authorised Mr. W. W. Lackie, the engineer of the electrical department, and Bailie W. B. Smith, the convener of the committee, to visit the United States and Canada for the purpose of inspecting the largest electrical installations in operation there. The visit is considered advisable in view of the necessity for providing a new electrical generating station for the city. Bailie Smith, of the Electricity Committee, said they were acting on the principle that a thing well begun was half done. They had bought the best piece of ground for the purpose in the whole city at a price one-fourth less than was paid for either of the two other stations One of the greatest electrical authorities, Dr. Ferranti, had advised them before they did anything in Glasgow to visit America. Those responsible for the spending of over a quarter of a million wanted to learn every detail in which they could economise. Bailie Smith said that no consultiug engineer would be employed on the new station; their new staff were quite capable of acting as consulting engineers.

**Sheffield's Tramway Undertaking.**

In our present issue will be found a fully illustrated and detailed description of the tramway system owned and worked by the Corporation of Sheffield. The annual conference of the Municipal Tramways Association, which will be held in the centre of the British steel making industry, is now only a few days distant, and the members attending the Conference will be interested in all the details connected with the tramway undertaking in Sheffield. So far as the engineering and the construction work of this tramway system are concerned, there is nothing of a very exceptional nature. Some of the lines have been running electrically for no less than 14 years, and during that time the system has been greatly extended. Sheffield has an independent power-station for the tramways, and this station has grown with the growth of the system, so that at present the plant is of a somewhat varied nature, and does not represent one systematic scheme drawn up at one time. In regard to the operation of the tramways, it will be noted that Sheffield was one of the first of the larger centres to adopt a maximum penny fare within the municipal boundary. The financial results have all along been satisfactory, though no effort has been made to build up a very large reserve fund. Owing to the age of many of the lines it is probable that the maximum annual charge for track renewals has now been reached, and indeed within recent years the Corporation have spent large sums in renewing the tracks. Thus it is that although a certain sum is set aside out of profits every year for renewals, the renewals fund is not increasing. It is, however, showing itself ample for requirements. One of the features in Sheffield, which is shared by a number of towns in the north, is the very hilly nature of the routes traversed by the tramways. In spite of this the working expenses are reasonably low, and at the same time there has been great freedom from serious accident. Members of the Conference who have not yet taken up the subject of vestibule cars will be interested in watching the operation of the vehicles of this class in Sheffield. Altogether they will find that the system, both as regards construction and as regards operation, is an eminently practicable and workmanlike affair, serving the citizens well, paying its way, and contributing substantially out of profits to various public objects of the city.

**Design of Bogie Trucks.**

Recent developments in the field of heavy electric traction on railways have brought up again several questions of importance in the design of rolling stock both on the mechanical and on the electrical sides, and one of the most difficult of solution is that of the proper design of bogie trucks. The conditions under which bogie trucks run on electric railways differ considerably from those which are met with in tramway working on the one hand, and in ordinary steam working on the other. On tramways the load to be carried is smaller, the speeds are lower, but track conditions are usually worse than in railway working. Bogies for use under coaches in steam railway working are not required to transmit any driving forces, being merely trailers and, although the design of a good trailer bogie is difficult, several very satisfactory designs are running on our great railways. The question of suitable materials to be used in construction of trucks is however, worth consideration. When electric traction was first introduced into this country, steel was the substance mainly used in truck

Digitized by Google

construction. The cast-steel side frame was almost universal, and it was not until after a good deal of running that it was found that this material left a great deal to be desired. It was found that cast-steel side frames were very liable to crack and break at points where the cross sections changed. The trouble is, of course, to obtain satisfactory castings in the comparatively thin sections employed, especially at such points as the side of the spring pocket where the I section changes to a large mass of metal. The large mass of metal, in cooling in the mould, draws the metal away from the smaller section, leaving flaws in the casting at places where such alterations occur. Test pieces cut from such a fractured truck side give, in most cases, very satisfactory results, and the metal itself cannot be blamed. If it were possible to obtain really satisfactory castings, the cast-steel side frame would be a most excellent solution of the difficulty, as it lends itself to very simple truck design. In America it is stated that good results have been obtained by the use of vanadium steel in steam locomotive side frames, and it may be possible to obtain sound vanadium steel castings for truck sides. But cast steel for this purpose has now such a bad reputation among railway engineers that it would require a brave man to go back on previous experiences.

* * * *

A substance has to be found to take the place of cast steel, and two substitutes are in general use, namely, pressed steel and forgings. Of these, the former is at present in great favour, though signs are not wanting that it may have to be abandoned in favour of forged truck sides. The very high temperature at which the metal has to be worked in order to get satisfactory pressed steel stampings tends to kill the nature and fibre, especially at the corners, and trouble has arisen owing to the metal tearing at these points when previous calculation led the designer to believe there was ample strength. As a general rule sharp corners have to be avoided, and this is very difficult in the limited room which is disposable. Trucks in which use is made of rolled-steel channel iron, on to which cast-steel horn blocks are riveted, have been tried with fair success, and development along this line may prove the most satisfactory solution of a very difficult problem. With regard to the metal work generally in truck construction, there seems to be a very general reversion to good quality iron instead of mild steel for transomes and other members under considerable stress. Ordinary mild steel is not so fibrous as good quality rolled iron, and it seems to crystalise much more rapidly, and though—strength for strength—the iron is heavier than steel in the first place, its greater dependability is causing it to be viewed with ever increasing favour by rolling stock engineers.

**London Motor Traffic.**

Just at the close of the Parliamentary session in August the Select Committee of the House of Commons, who had been hearing evidence for several months on the subject of accidents arising from motor traffic in the metropolis, presented their report. It is a very voluminous document, and though in our present issue we present a somewhat full abstract, those who are specially concerned on the subject would do well to read the report in full, which has been published in the ordinary way as a Parliamentary paper. The Committee felt themselves obliged to investigate a great variety of points in connection with London street traffic in order that they might be better able to make proposals for the prevention of accidents. Of course, the scope of their inquiry was not nearly so extensive as that of the Royal Commission on London traffic which reported in 1905, but so far as the recommendations of the present Committee go they bear out and corroborate many of the conclusions of the Royal Commission. In regard to most of the recommendations securing the safety of the public there will hardly be two opinions, and it will be the business of the Government to see that they are carried out. All tramway authorities will agree that the proposal of the veto of the Metropolitan Borough Councils against tramways should be abolished. The proposal of the Committee which has raised the greatest opposition is unfortunately the most important of their recommendations. This proposal is that the County Councils who have jurisdiction within the metropolitan area should be constituted traffic authorities for licensing, regulating, etc., and that from their decisions their should be an appeal to a new Traffic Branch of the Board of Trade to be

Digitized by Google

specially constituted for the purpose. This recommendation has been met with wide disapproval; in fact, the only parties who appear to support it are those who may be described as extreme municipalists. It appears that all, or nearly all, of the members of the Select Committee are, or have been, members of local authorities. The proposal that a local authority should be in supreme control might be suitable enough in provincial towns, but is wholly unsuitable in the case of London. Moreover, two or three of the County Councils concerned are themselves the owners of extensive tramway systems, and their position would be most invidious if they were to be in control of all street traffic, including the omnibuses which compete with the tramways. The real and only solution of the whole problem, which is once more pointed out, is the formation of an independent Traffic Board composed of experts, and appointed by the Government with even wider powers in regard to the initiation of schemes and in regard to legislation than were proposed by the Royal Commission when they recommended the formation of such a Board. We deal further with the subject from the automobile point of view in the motor traffic section of this issue.

**Children's Fares.**

In gathering information from tramway authorities on the question of cheap fares for children, Mr. Mallins, general manager of the Liverpool tramways, found that there is no uniform practice. A number charge half-fares for children between the ages of 3 and 10 years, and several cases up to 10 and 14 years, which to some extent covers the school period. A number of other authorities, including London and Liverpool, do not make a charge for children under five years, but charge full fare over that except when special cars are hired. The most difficult problem in connection with the arrangement of preferential fares, Mr. Mallins observes, is the fact that school children generally travel during the maximum hours of traffic morning and evening, when the rolling stock is taxed to its utmost capacity on all large systems, with the result that overcrowding is increased. There is another aspect of the matter to which attention may be directed, namely, the relation of tramways to the public secondary schools set up of late years to serve a group of districts in large cities and towns. In some of these places, and in towns where one secondary school suffices, the tramway committees grant reduced fares, or if the transit facilities are in the hands of a company the Education Committee make themselves responsible for the payments. A pleasing indication of the municipal aspect of the transit undertakings in the industrial centres is that during the school holidays reduced fares are granted to children so that they may be enabled to visit the parks and other open spaces. This traffic can be arranged so as to utilise cars returning from the centre of the town after the morning rush traffic, and the same result can be achieved on the return journey. It is to be regretted that this course is not adopted by the London County Council, especially as the chairman of the Highways Committee is stated to possess powers to alter any fare in a downward direction while the Council is in recess. Moreover, for two or three years past the Council have granted school children very cheap tickets when accompanied by teachers, such as a halfpenny per head for any distance to a swimming bath, and one penny for a single journey and twopence return to playing fields and museums. It is understood that after the vacation the Highways Committee will consider the question of reduced charges for children accompanied by parents or adult friends during the slack hours. Perhaps the most generous treatment of children on ordinary occasions is that recently inaugurated by the Sheffield tramways, where half-fares are allowed up to the age of 15, while for children under five years no charge is made.

## HOURLY NIGHT CARS FOR MANCHESTER.

The Manchester Tramways Committee on August 26 considered a report presented by Mr. J. M. McElroy, the tramways manager, upon the petition recently presented to the committee asking for the institution of a service of all-night tramcars or motor omnibuses. Mr. McElroy stated that until the receipt of the petition recently presented there had been no clear evidence as to what the demand really amounted to. His opinion was that an hourly service of cars ought reasonably to meet the demand at the present time. From the point of view of the tramways department there were objections to the running of an all-night service, the principal one being that it made the efficient maintenance of the track and overhead equipment more difficult. If the committee determined to fall in with the views of the petitioners, the department would endeavour to carry out the minor repairs during the intervals between the running of the cars, and when more important repairs or reconstructions were necessary the services would have to be run by means of motor omnibuses. He recommended that the services be limited to week nights only, the demand for the early morning service on Sundays being so very small. The committee adopted the report, and it was confirmed by the City Council on September 3. The service began the same night.

## RAILLESS TRACTION IN LANCASHIRE.

INAUGURATION OF THE RAMSBOTTOM INSTALLATION.

After a series of satisfactory trial runs the Board of Trade inspection took place on August 21 last of a new railless trolley system laid down by the Urban District Council at Ramsbottom, near Bury, Lancashire. The cars run from near Holcombe Brook Station, on the Lancashire and Yorkshire Railway, to the hamlet of Edenfield, on the road to Rawtenstall, passing through Ramsbottom, and calling at Ramsbottom Station, a distance of about three and a half miles. This will open quite a new but hilly district, containing some of the finest scenery in the country. The results of the venture are being closely watched by the adjoining local authorities; if satisfactory, the system will be extensively adopted by them to serve their respective tramways. As it is, the Edenfield terminus being a short two miles from the Rawtenstall, a short walk or a journey on electric trains over the three miles, Bury to Holcombe (lately opened by the Lancashire and Yorkshire Railway), will enable residents of Manchester and district to reach north-east Lancashire by a shorter route than the one through Rochdale and Bacup.

Lieut.-Colonel Druitt and Mr. Trotter made the inspection on behalf of the Board of Trade, and in addition to the inspecting officers the first car contained Councillor Wilkinson (chairman of Ramsbottom Urban Council), Mr. J. B. Hamilton, Mr. Jekin (assistant consulting engineer), Mr. W. Clough (manager, Bury Tramways), Mr. C. L. E. Stewart (manager, Rawtenstall Tramways), Mr. Clough (Clough, Smith, and Company, of London, overhead contractors), Mr. E. M. Munro (of the R.E.T. Construction Company, Limited), and Mr. J. Wild (manager of the Ramsbottom Tramways). The last-named was the driver of the car. The inspecting officers found that the system generally was satisfactory, and gave permission for immediate working. Four single-deck cars, each seating 28 passengers, are employed. Each has the R.E.T. Construction Company's double trolley of the under-running type, which allows the vehicle a radius

Ramsbottom Car on Level.

Car Descending Steep Gradient.

Ramsbottom Car Turning at Terminus.

Digitized by Google

of 16 ft. from the centre of the trolley wires, of which there are four, in order that the car may be driven over the whole of the roadway. The car is driven by two 20-H.P. motors, and as it is driven only from one end at each of the three termini the overhead wires are in the form of part of a circle to enable the cars to be turned. The maximum weight of a car when loaded is five tons. The system is similar to that which has given such satisfactory results at Leeds, Bradford, Rotherham, and Dundee.

Messrs. Siemens supplied the electrical equipment, Messrs. Clough, Smith, and Company, London, the

**Despatch of First Railless Car to South America from Works of R.E.T. Company.**

overhead construction, Messrs. Brown, of Huddersfield, constructed the chassis, and the bodies were built by Milnes, Voss, and Company, Birkenhead, the main contractors for the whole of the work being the R.E.T. Construction Company, London, E.C. The current is supplied by the Lancashire Electric Power Company, at a pressure of 10,000 volts, which is converted to 500 volts in a small sub-station adjoining the new car depot in Stubbins Lane. The car shed will accommodate six cars, and there are also repair shops, store rooms, mess rooms, and offices.

## NEW TYPES OF R.E.T. CARS.

The great advance made in the design and production of highly efficient worm gear has made possible considerable improvements in the type of transmission gear particularly suitable for railless electric cars, and the R.E.T. Construction Company, Limited, taking advantage of this, have been able to produce some new types of cars, embodying improvements calculated to still further popularise this form of vehicle.

The improvements lie principally in the transmission gear, which now consists of a single worm reduction for each motor, dispensing with all chains, and achieving a higher mechanical efficiency, and at the same time reducing the weight.

Two examples of these cars are shown in the accompanying illustrations. Fig. 1 shows a typical example of a car for use in this country, and is fitted with the company's latest form of controlled trolley, capable of freest movements at any speed, and gives full control of a road 40 ft. in width. Fig. 2 shows another form of the same vehicle with a slightly different seating plan, the deck to the rear platform being only 24 in. from the ground, and the floor of car 2 ft. 9 in. from road level. Other forms of cars and trailers are shown in Figs. 3 and 4, which give some idea of the developments in hand. A number of cars of the above types are being constructed by the R.E.T. Construction Company, Limited, for work at home and abroad.

## THE WORKS OF HADFIELD'S STEEL FOUNDRY COMPANY.

The programme of visits which has been arranged for members of the conference at Sheffield of the Municipal Tramways Association includes a visit to the East Hecla works of Hadfield's Steel Foundry Company, Limited. These works are always of special interest to those connected with the maintenance of the tramway permanent way. Hadfield's patent "Era" manganese steel is so well known that it is unnecessary here to enlarge on its good qualities except to say that it is now recognised as of supreme value for parts of the permanent way, such as switches, mates, crossings, and curved rails, subjected to severe service conditions.

The East Hecla works are thoroughly up-to-date, and they are equipped with the most modern machinery. To take things in proper sequence we should first refer to the large pattern shop, which is fitted with wood working machinery of first class type. The foundry is the most extensive of its kind in the world, and covers an area of over 6½ acres. There are large annealing shops attached and also fettling shops. The grinding shops are necessarily important when it is remembered that although "Era" manganese steel is particularly ductile, it is so hard as to be commercially unmachineable. There are four machine shops furnished with electrically driven machine tools of various kinds. Then there are the forge and smith's shop, but enough has been written to show that at these works the visitor may rely on seeing something that will be both interesting and instructive. The Hadfield patent "Hecla" point is now so well known and appreciated that it is needless to go into details; in combination with "Era" manganese steel it is a switch that cannot be surpassed.

A reference should be made to the large lay-out floor. Here intricate junctions, as well as those of comparatively simple design, are built up and prepared for re-erection on site, thus avoiding the interruption to vehicular traffic, which is such an irritating feature in the construction of trackwork in the streets. We may add that Hadfield's are also in a position to supply steel-tyred car wheels. The centre is of a suitable grade of Hadfield's best toughened cast steel, whilst the tyre is rolled from a special grade of steel calculated to give the best results both as to safety and mileage. No set screws are used, the tyre being secured by Hadfield's special lockfast method, which prevents the tyre moving sideways or circumferentially.

## RAILLESS TRACTION SCHEMES.

### An Aberdeen Suburban Scheme.

The directors of the Aberdeen Suburban Tramways Company have had under consideration the question of extending their operations by the working of trackless cars or other mechanically-propelled vehicles, and they are satisfied that this course would not only be profitable in itself, but would attract fresh traffic. A resolution to that effect was approved at the last half-yearly meeting.

### Important Developments at Leeds.

The Tramways Committee recommend the following installations of the railless traction system: From junction of Wellington Road and Tong Road, *via* Copley Hill, Wortley Lane, Mill Green, Sydenham Street, Domestic Street, Holbeck Moor Road, Lane End Place, Hunslet Hall Road, Moor Road, and Church Street to Low Road; from junction of Whitehall Road and Lawns Lane, *via* Lawns Lane and Chapel Lane to a point in Chapel Lane near the Recreation Ground, 60 yards from Hall Lane.

**Belfast Tramways.**—The Glengormely branch of the Belfast tramway system has proved profitable, in spite of the doubts expressed when the line was purchased. In seven months the profits have been £1,017.

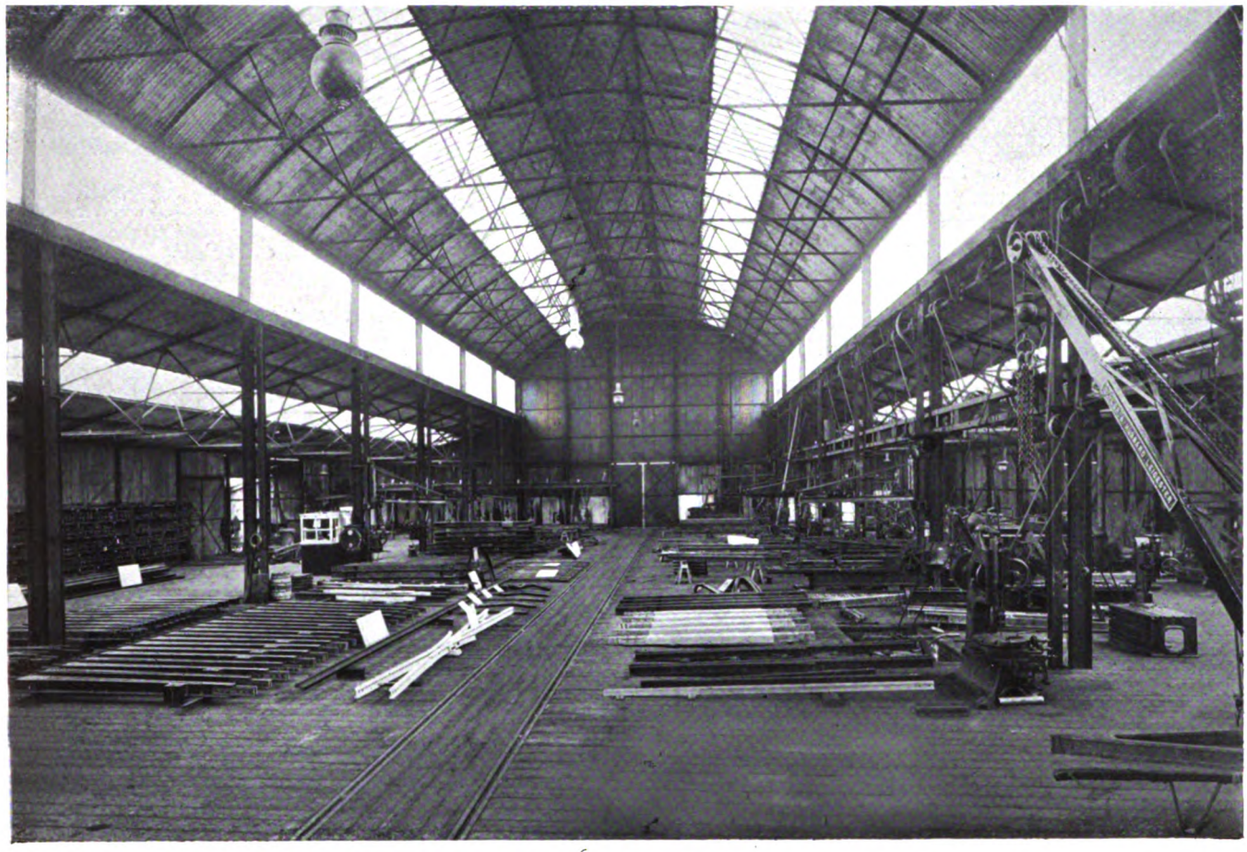
## EDGAR ALLEN'S STEEL WORKS.

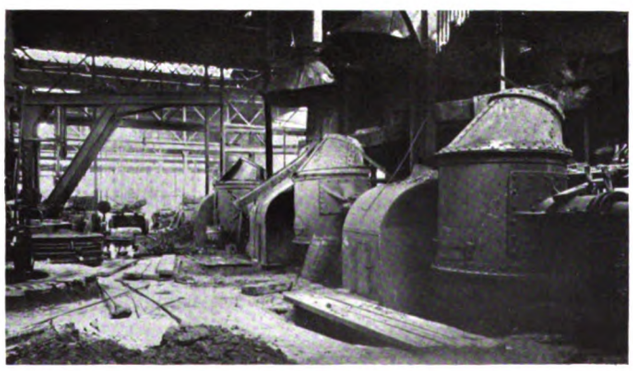
The members of the Municipal Tramways Association during the forthcoming annual conference at Sheffield are to include, among other works which they are to visit, those of Edgar Allen and Company, Limited. These works are well-known by reputation to tramway officers for their "Imperial" manganese steel, which is used so extensively for special track work. The company produce steel for many purposes, but for readers of this journal the principal interest is in connection with the tramway work. The company's output is over 50 tons per day, and their works, which originally occupied 5 acres, now cover about 23 acres, while very extensive shops are now being erected. Several of these are complete, and a very large foundry is also being built to cope with the increasing demands for points, crossings, and general castings. The foundry will be 500 ft. long with three bays, and 250 ft. wide, and will be one of the best foundries in the country. Unfortunately, owing to the delays in obtaining material, the foundry is some months behind-hand. During the past few years several new extensions have been made for dealing with tramway special work, and the railway department have also put down a special plant for dealing with the demand for railway material in rolled manganese steel, which Messrs. Allen and Company have made their speciality. They are making switches and crossings from the manganese rolled rails, which was impossible a year or two ago.



Point and Crossing Fitting Shop.

It is some 50 years since the chairman, Mr. Wm. Edgar Allen, began the manufacture of tool steel, which with files was the sole manufacture, but this was gradually extended. The process used by them is the "Tropenas." This was developed and perfected by the Company 20 years ago, and it has been a wonderful success and is now used by the British and Japanese Governments. The company's name is on the Admiralty, War office, India Office, and Lloyds' lists as

Tramway Pattern Shop.



Tropenas Steel Process.

Digitized by Google

contractors for steel castings, tool steel, etc. The wages paid per annum amount to over £100,000. The area of the steel moulding floors, formerly about 22,000 sq. ft., is now 42,000 sq. ft., and arrangements are being made to increase this to 120,000 sq. ft.

In 1903, the firm took over the business of Messrs. Askham Brothers and Wilson, Limited, a firm well known in connection with tramway work as well as crushing and grinding machinery, and now Allen's imperial manganese steel points and crossings are known wherever a tramway is laid. Points and crossings up to 18 ft. long can be supplied. Several acres of land are set aside for the construction of lay-outs, and the company are in a position to put down any size of lay-out that may possibly be required. The point and crossing pattern shop is 135 ft. by 70 ft. wide, and a considerable portion of the machinery is run electrically. Messrs. Allen have their own electrical installation, and also take power from the town; in fact they are one of the most extensive users of the city's electrical supply.

Point and Crossing Foundry.

Lay-Out Yard.

They were the first to put down furnaces for melting by electricity.

The Edgar Allen air-hardening steel takes the highest rank in the market, and they have big demands from the United States, Japan, and the Colonies. They have their own warehouses in South Africa, Japan, New York, Chicago, etc., worked by staffs sent out from Sheffield. Messrs. Allen have recently increased their capital for the purpose of extending their works, and if labour troubles can be avoided tramway engineers can depend on their requirements, however intricate, being executed carefully and quickly. We believe that most of our readers are cognisant of the tramway work done, but the accompanying illustrations give some idea of the shops and of the work on hand. We understand that, labour troubles permitting, the company will have one or two large lay-outs, together with other work, ready for tramway managers to see when visiting Sheffield.

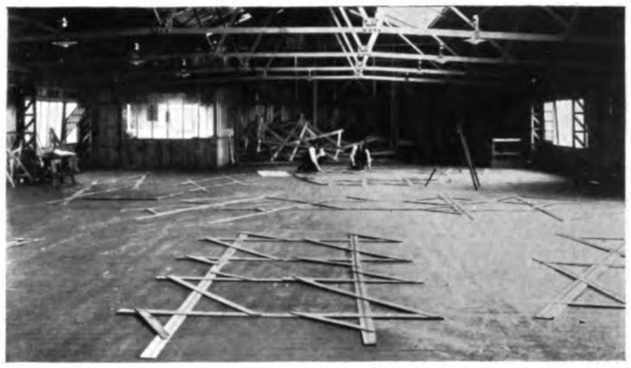
## "CEDES" RAILLESS TRACTION.

RUNNING COSTS ON THE FRIBOURG LINE.

Appended is the financial statement of the working in 1912 of the "Cedes" system of railless electric traction installed at Fribourg, Switzerland:

| WORKING EXPENSES. Dr. | £ | s. | d. |
|---|---|---|---|
| Administration and general expenses | 43 | 14 | 5 |
| Electric current .. | 89 | 5 | 9 |
| Staff .. .. | 407 | 5 | 11 |
| Maintenance and repairs (tyres £65 2s. 5d.) .. | 110 | 1 | 10 |
| Uniforms & printing | 81 | 15 | 6 |
| Insurance and taxes | 69 | 1 | 7 |
| Miscellaneous .. | 36 | 10 | 7 |
| | 837 | 15 | 7 |
| Balance to profit and loss account .. | 374 | 4 | 0 |
| | £1,211 | 19 | 7 |

| TOTAL RECEIPTS. Cr. | £ | s. | d. |
|---|---|---|---|
| Passengers and luggage .. .. | 1,182 | 17 | 4 |
| Goods .. .. | 22 | 16 | 0 |
| Sundry receipts (sale of time-tables) .. .. | 6 | 6 | 3 |
| | £1,211 | 19 | 7 |



Lay-Out Floor.

Manganese Steel Lay-Out.

The number of passengers carried was 98,318, and the number of miles run by the cars, 37,659. The receipts per mile run amount to 7·5d. The running costs of the Fribourg line total 5½d. per car-mile. The sharpest gradient on this route is 1 in 9, and during the winter months the cars run through snow.

**Accumulator Traction.**—The Australian *Mining and Engineering Review* states that the Townsville, Queensland, Council has granted Messrs. Minham and Sons an extension for six months of the option for their scheme of electrical tramways on the electric accumulator system.

**Largest Tramway Depot.**—The Lichtenberg car shed of the Greater Berlin Tramway Company which was recently opened is declared to be the largest tramway depôt in existence. There is now accommodation for 500 cars. It is proposed to accommodate the two thousand employees in a garden city formed around the depôt.

**The Tramcar Habit.** Sir Ian Hamilton, in the course of a report on Canadian military affairs, mentions that the city corps require training in pedestrianism for the reason that they suffer from the prevailing Canadian habit of preferring any other mode of locomotion to making appeal to their legs. Their chief function, he declares, seems very often to consist in standing in the street waiting for a tramcar.

# LONDON TRAFFIC REGULATION.

## Report of the Select Committee.

The report of the Select Committee, who were originally appointed by the Government on November 27, 1912, was issued on August 14. Their principal recommendation is that a new Traffic Branch of the Board of Trade be set up as a Traffic Board to advise Parliament in all metropolitan traffic matters.

### Recommendations.

The Committee's own summary of their proposals is given in full below:

(1) That in all metropolitan traffic matters Parliament should be advised by one department, which should combine the traffic duties of the Home Office, the Local Government Board, and the Board of Trade, including the confirming of by-laws.
(2) That a new Traffic Branch of the Board of Trade be set up to perform the above and other duties.
(3) That the veto of Borough Councils in regard to tramway schemes be replaced by a full hearing before the new Traffic Branch, which shall report to Parliament. That Standing Order 22 be revised.
(4) That County Councils in the metropolitan area should have the widest possible by-law-making powers, subject to confirmation by the new Traffic Branch of the Board of Trade.
(5) That all mechanical stage carriages and hackney carriages be brought under closer control; that the routes, time tables, and number of stage carriages be subject to County Council regulations confirmed by the new Traffic Branch of the Board of Trade, with a right to local authorities and other interested parties to be heard, such right to extend to any decision of a Council relating to these matters, or the refusal or neglect of any Council to take action when requested to do so; that the design of mechanical stage carriages be subject to the new Traffic Branch, which should have independent expert advice.
(6) That the licensing of stage carriages and hackney carriages be a duty of County Councils and County Borough Councils, subject to a right of appeal to the New Traffic Branch.
(7) That special speed limits for motor omnibuses and other heavy motor traffic be imposed where conditions are especially dangerous.
(8) That closer control of traffic be exercised by the police.
(9) That traffic points be fixed at a greater number of crossings.
(10) That more refuges be provided.
(11) That so soon as practicable means be taken to remove the congestion caused by dead ends of tramways, street markets, and roadway obstructions.
(12) That the measures already taken through the schools to warn children and parents as to street dangers should be continued and extended.
(13) That suggestions as to amendments of the law and other matters mentioned in the report be carried into effect.

The report, which is of much interest, was issued in the form of a "White Paper," and covers 42 pages, of which we give a brief summary:

### Points from the Report.

The reason for the appointment of the Committee was the increasing number of fatal accidents in the metropolis, due to motor omnibuses and other forms of power-driven vehicles. In pursuing this inquiry, the Committee held 42 sittings and examined 54 witnesses. They found it impracticable to consider the question of safety separately from the general traffic problem of London. Referring to the Royal Commission on London Traffic, which reported in 1905, the Committee observed that many of their recommendations, if carried out, would have tended in the direction of public safety, and most of those recommendations have only become more urgent in the time elapsed since they were made. The changes which have taken place since 1905 are due to the development of mechanical traction, as will be seen from the statistics appended:

| | Horse Cabs. | Horse Omnibuses and Tramcars. | Electric Cars and Motor Omnibuses. | Motor Cabs. |
|---|---|---|---|---|
| 1907 .. .. | 9,818 | 2,961 | 2,973 | Nil. |
| 1912 .. .. | 2,385 | Nil. | 5,767 | 8,000 |

The difficulties described in the report of the Royal Commission have been intensified by this change. The development of the inward and outward current of travel is shown by the following figures. In 1904 the journeys taken per head of population amounted to 150, and this figure has increased to 228 per head. The total numbers for 1911 are:

| | |
|---|---|
| Tramway passengers .. .. .. .. | 821,819,741 |
| Omnibus passengers .. .. .. .. | 400,628,487 |
| Local railway passengers .. .. .. .. | 436,398,745 |
| Trunk railway passengers from a 30-mile limit | 250,000,000 |
| | 1,908,846,973 |

The daily increase is not less than 250,000, and by 1920 it is estimated that the number of journeys will exceed 3,000,000,000.

In the administrative county of London the numbers of fatalities during the last three years were—in 1910 281, in 1911 357, and in 1912 422. The increase in the number for 1912 over 1910 in the Metropolitan Police area was 149; the increase for the same period in the administrative county was 141. This justifies the inference that the causes producing fatalities operated more severely in the smaller area. There was no such increase of population as would account for the increase either of fatalities or of accidents. The population of the larger area in 1904 (including the City of London) was 6,775,645, and in 1912 it was 7,340,079. The percentage of accidents to population increased from ·177 in 1904 to ·303 in 1912.

During the last three years the fatalities caused by horse-drawn vehicles in the Metropolitan Police area have not varied to any great extent. In 1910 they were 167, in 1911 135, and in 1912 168, but the fatal accidents in which power-driven vehicles were concerned were 214 in 1910, 284 in 1911, and 369 in 1912. As the number of horse-drawn vehicles has considerably decreased, there is evidently some cause producing a larger percentage of accidents in which the smaller number of horse vehicles are concerned.

During the last three years the fatalities have increased enormously, and the amplification of the traffic has outgrown the methods for dealing with it. A dictator for a half a dozen years would have a difficult task, owing to the inherent physical obstacles he would have to encounter. In London such a solution is, of course, impossible, and the committee consider that existing institutions must be used with such developments as experience dictates, and with proper regard to existing rights and interests.

Three methods of securing powers to construct tramways are open to promoters, with advantages for one or other purpose attending each. Three Government departments are concerned in the regulation of matters connected with street traffic in London, yet none of them, nor all of them together, is responsible for the whole of it. Three types of municipal government are seen in the area of the London administrative county, the ancient City Corporation, the London County Council, and the Borough Councils. Outside, in Greater London, County Councils, County Borough Councils, Borough Councils, and Urban and Rural District Councils have rule, with separate and sometimes diverse interests. The total number of local bodies in the outer ring is 142. This area of nearly 700 square miles is—except the City—under the control of the Metropolitan Police. The existence of this police force under the control of the Home Secretary and not under municipal control, is itself a significant fact, which separates the conditions which the committee have had to consider from the conditions of any other great populous area in the United Kingdom.

The Committee have had forced upon them the conclusion that a speeding up of every department of municipal and parliamentary government is necessary. Control of the streets is essentially a municipal function, and the same men should have before them the question of the adequacy of the streets, the facilities for traffic and its regulation, and the safety and convenience of pedestrians. Parliament could not be expected to deprive itself of power to secure equitable arrangements in the local legislation which it enacts, and in the supervision of local affairs by the various departments of State. It remains, therefore, so to adjust the municipal institutions of the metropolitan area and the instruments by which Government exercises control, that the public may feel confidence in the justice and impartiality of the decisions taken.

The Committee does not feel that a comparison between tramway and non-tramway streets, to which considerable importance was attached by Sir E. Henry, was of much assistance in indicating to them any method of securing greater safety; for fatal accidents are quite as numerous in streets where there are no tramways as in those where such lines exist. Mr. A. H. Stanley, who gave evidence on behalf of the London General Omnibus Company, did not lay any stress on the presence of tramways.

The rate of personal injuries per million passengers for the London County Council trams was ·86, which compares reasonably, though not commendably, with the provincial rates. These rates in 1912 were: Glasgow, ·69; Leeds, ·58; Liverpool, ·68; Manchester, ·70; Newcastle, 1·05. Each of these cities shows a progressive improvement in the five years. The record of the outer ring of London is not so good, for the personal injuries numbered 2·2 per million, and this year has the worst figures for the five years.

The table handed in by Colonel Hellard brings out a very striking comparison showing that electric railways have an immensely more favourable record for injuries, and for fatalities a record equal to tramways, and much superior to the omnibuses. The character of

Digitized by Google

public vehicles on the streets closely affects the question of public safety. The design of tramcars is subject to two bodies—the Board of Trade and the Metropolitan Police. The Board of Trade have to inspect every tramway before it can be worked, and have made it a rule that promoters shall submit drawings of their cars before they have them built. The brakes of the London County Council are the most powerful known. While the brakes of some of the other tramway systems do not, perhaps, come quite up to the London County Council standard, they are considered satisfactory by the Board of Trade. Powers possessed by the police enable them to refuse a licence until they are satisfied that the brake is in proper working order, and they also inspect cars on the streets at any moment that seems fit to them. The Committee think, however, that the control of the brakes by one department should be sufficient, and that the experience of the Board of Trade fits it for this responsibility. The minimum of inspection while the vehicle is actually on the streets should be aimed at, and the management should be responsible for a system of daily inspection which will ensure that no vehicle will appear on the streets in an improper condition. The design of safety-guard which has been adopted by the London County Council Tramways has proved very effective, and has been approved by the Board of Trade.

### Development of the Motor Omnibus.

The London General Omnibus Company afforded the fullest details to the Committee of its methods of working and control. While some points are open to criticism, on the whole the Committee recognise that the company is managed in a most capable manner. Motor omnibuses commenced to run in London in 1897, and their development has been exceedingly rapid. From the first type of omnibus employed down to the present "B" type there have been 32 designs, all of which have had to conform to the regulations of the Local Government Board as to heavy motors and the requirements of the Chief Commissioner of Police. The latter had a very difficult part to play in this development, as he had to protect the public and yet to permit that street experience which could alone make the vehicle permanently safe for public use. The accident record of the motor omnibus is set out below:

| Year. | Licensed. | Fatalities. | Per 1,000 Buses. |
|---|---|---|---|
| 1907 .. .. .. | 1,205 | 35 | 29·0 |
| 1908 .. .. .. | 1,133 | 62 | 54·7 |
| 1909 .. .. .. | 1,180 | 59 | 50·0 |
| 1910 .. .. .. | 1,200 | 70 | 58·3 |
| 1911 .. .. .. | 1,962 | 114 | 58·1 |
| 1912 .. .. .. | 2,908 | 182 | 62·6 |

Further improvements in design are foreshadowed, but not with great confidence. Mr. Worby Beaumont in his evidence before the Committee, said that he hoped for solid tyres for omnibuses made so that they will offer the probability of very greatly reducing, if not eliminating, the side-slipping danger. Some criticism was made on the type of brake on the motor omnibus in evidence from representatives of drivers, but Mr. Beaumont stated that the brakes were fully competent to hold the driving wheels tight and prevent their rotation. The difficulty lies not so much in the brake as in the vehicle, and its responsiveness to the brake on a smooth road. According to the evidence submitted, there appears to be great difficulty in securing a satisfactory life-guard to motor omnibuses. The London General Omnibus Company have a staff of a dozen men continually experimenting, but no progress appears to have been made with a front guard, though the problem of a side guard appears to be in course of solution.

The Committee say they have not exhausted the question whether a lighter omnibus would not avoid many of the present dangers. If reducing the weight would make the vehicle much more safe, the financial effect should not be given too much weight, and it is a problem which expert advisers might decide. Mr. Beaumont was of opinion that the omnibus is not too heavy and too powerful for the brakes, in view of the present conditions of London traffic. He considers a lighter vehicle desirable from other points of view.

He also stated that in addition to acting as technical adviser to the Chief Commissioner, he was technical adviser to the motor omnibus companies; and the Committee think that the technical adviser to the Chief Commissioner should be an independent official.

Both the tramcar and motor omnibus are dangerous vehicles from their weight and bulk and the power of their engines, and the systematic training of drivers is consequently a necessity. The Committee feel that the practice which prevails of paying motor omnibus drivers by the journey is inimical to safe working in crowded traffic.

### Stopping Places.

The position of tram lines in the middle of the roadway raises a very acute traffic problem, which the Committee discuss at some length. This difficulty is aggravated by the presence of the motor omnibus, which exaggerates the danger while tramway passengers are crossing to and from the pavement. In connection with this cutting in upon tramway passengers, the question of stopping places for both tramcars and omnibuses appears to arise. A new solution, which seems to approve itself to the Committee, is that representatives of the local councils, tramway and omnibus authorities, and the Police Commissioner should meet and consult together. In this way it is hoped that a solution will be found for what has hitherto been a real difficulty. The Committee think that if there were present at this meeting an independent chairman from the Government department, a method of minimising friction and promoting safety would be secured.

The London County Council proposed a by-law to the following effect: "No driver of an omnibus or other stage carriage shall stop such omnibus or stage carriage to take up or set down passengers in such a position in the immediate vicinity of any tramway stopping place as to cause obstruction to passengers or intending passengers alighting from or entering any tramcar."

The Committee think the principle suggested to be reasonable. As regards speed, the Committee do not recommend any alteration of the maximum for tramways nor for motor omnibuses, and they are of opinion that the procedure by which speed limits are fixed is satisfactory, and that the County Councils are the proper authority through which applications should be made, local opinion being duly heard. The Committee are of opinion that both tramcars and motor omnibuses should be fitted with speed registers as soon as practicable. Slow-moving traffic is the cause of great delay, and the Committee recommend that a by-law should be immediately passed putting into operation the recommendations of the Royal Commission of 1905 that all vehicles proceeding at a slow or walking pace should be required to keep as close as practicable to the kerb. A serious cause of congestion within the inner ring is the existence of tramway "dead ends," and the Committee repeat the comment of the Royal Commission that it was difficult to appreciate how such a state of things could be tolerated so long, and whatever view might be held of the expediency of extending tramways in London, it cannot be expedient to work those we have upon inefficient methods.

Evidence was given which showed that there was considerable risk of accident and obstruction arising from the presence of many vehicles in an unsound condition, and the Committee considered it desirable that a by-law should be framed imposing penalties on any driver or owner who knowingly sent out an unsound vehicle.

### Street Widenings and Contributions of Tramways and Omnibuses.

The running of motor omnibuses has had considerable influence upon the question of street widenings. When widenings are made for tramways the tramways bear a large proportion of the cost, on the ground that they are introducing through traffic which did not before exist. Motor omnibuses are now running down similar streets, and they introduce through traffic which produces necessity for street widening, but provide no revenue to pay for it. Tramways also pay for paving the track and a portion at each side. These costs, with rates and taxes, are represented as being a charge of about £200 per car annually. A paragraph in the report of the London Traffic Branch of the Board of Trade for 1911 states that omnibus companies pay no rates in respect of the roads which they use, but motor omnibuses pay "in the shape of the petrol tax about £45 per vehicle per annum. . . . Of the two, the tramways are less unfavourably situated in regard to these burdens." Colonel Hellard, head of the London Traffic Branch of the Board of Trade, who was not responsible for that volume, admitted the comparison was incorrect, and withdrew it.

When asked if he had to pay towards track and road improvements and rating on track equivalent to what the London County Council has, of £200 per vehicle, Mr. Stanley said he thought it would mean to the motor omnibus proprietors of London a sum somewhere about £600,000.

### Abolition of the Local Veto.

As regards Parliamentary procedure, the Committee alluded to the obstruction offered to the building of tramways by the Metropolitan Borough Councils which have the right of veto, and they found that the extreme use of the veto goes beyond the purpose for which it was intended. The veto was originally granted to local authorities to prevent them being harassed with speculative schemes promoted by private interests. It was not at that time contemplated that there would be a central municipal authority which would become the sole tramways promoter in London. Standing Order 22 of both Houses of Parliament was meant to secure that local authorities should be consulted before private tramway schemes were submitted to Parliament, but the same check is no longer necessary to safeguard public interests. The Committee agree with the conclusions of the Royal Commission that any reasonable objection to the abolition of the veto would disappear after provision were made for the local authorities to state their views concerning any proposed tramway scheme to an independent and impartial body such as the new Traffic Branch which the Committee recommend.

### The Traffic Board and its Duties.

It is agreed by all parties that the development of the motor omnibus has rendered very great service to London, but the omnibus has

Digitized by Google

yet to be put under proper control. After careful consideration of the matter the Committee are of opinion that the routes, time-tables, and number of such carriages should be subject to regulations formulated by County Councils and County Borough Councils and confirmed by the new Traffic Branch with a right to local authorities and others interested to be heard. The Committee have carefully considered the question of machinery best to be used in controlling and providing for London traffic. These powers and duties are at present scattered, duplicated, and incomplete. The bodies to which they are entrusted are very numerous, and tenaciously uphold local interests. It becomes a question, not of setting up an ideal system which might meet with a maximum of opposition, but of utilising as far as possible existing bodies and laws, so as to enable them to meet the changed conditions with the least friction and delay. The Committee are of opinion that what is required is a new arrangement of the functions of Government departments. The duty of originating and accommodating traffic schemes and regulations is in their opinion a municipal duty. Co-ordination can be secured by consultation between adjoining municipal authorities, under the direction and advice of a Government department which is its itself properly constituted to meet the special conditions. In the outer London ring there are five counties, and each has within it many authorities. They cover an area of some 600 square miles. There are in addition the Metropolitan Borough Councils, which are important bodies with great financial resources behind them and representing important interests.

The Committee believe that the arrangements they suggest will be such as to secure their confidence. At present, as has been set out, no one Government department fulfils the requirements. The Committee contemplate a body of sufficient standing to command the respect and confidence of Parliamentary Committees and of all the municipal authorities with which it will come in contact. It should supersede or absorb the London Traffic Branch of the Board of Trade. It should consist of a small number of specially qualified persons, and the choice should not be limited to Government officials. Expert advice of the highest character should be put at its disposal. The Committee do not propose that the body should be a separate Government department, but recommend that it should be a branch of the Board of Trade.

The duties of the new Traffic Branch as briefly outlined by the Committee are as follow :

All schemes relating to London traffic presented to Parliament should be examined and reported upon by it, and no other Department should report to Parliament, except through it.

It should actively concern itself with the traffic problems of London, working through and in harmony with the various existing bodies responsible for the various areas.

It should hold conferences, if requested or by its own motion, with the representatives of various municipal authorities concerning the development of through traffic routes, and other matters in which common action or agreement is advisable.

It should have power to hold public inquiries in order that the interests of localities may be ascertained, and due weight given to them in consideration of all projected undertakings or new by-laws. It should have power to summon witnesses.

All by-laws relating to London traffic should come before it for confirmation. It should be the confirming authority for the regulations of County Councils and County Borough Councils as to routes, etc., of stage carriages; and should hear appeals from the decisions of Councils.

It should fix, where it considers necessary, on the application of a local authority, special speed limits for motor omnibuses and speed limits for all motor traffic.

It should have power to regulate the structural character of all stage carriages.

It should receive reports, from the police and parties concerned, of all traffic accidents, and special reports from coroners of inquests.

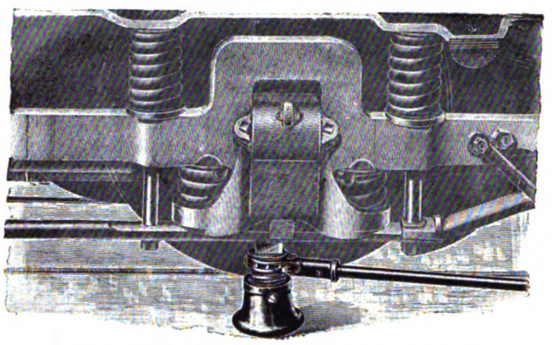
Other duties might be laid or devolved upon it as experience suggests.

**Standing Compartments in Bombay Cars.**—Bombay Council have adopted a recommendation by the Tramways Committee that the company be allowed to introduce two standing compartments in their bogie cars for a period of three years from January, 1914, to provide accommodation for passengers during the crowded hours of traffic. The passengers are to be allowed to stand, the convenience having been demanded by the public.

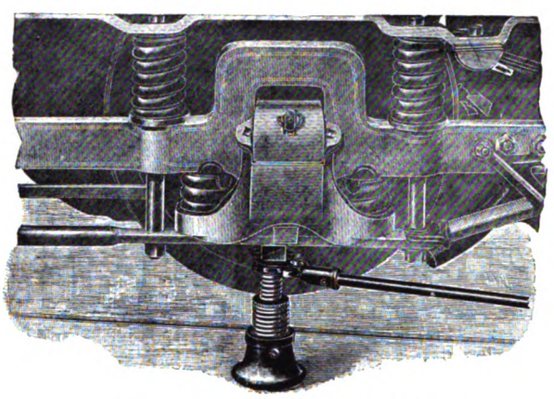
**Municipal Tramway Authorities' Influence in Parliament.**—In a report presented to the London County Council, the Parliamentary Committee referred to the deletion of clauses inserted in the Council's Bill by a Committee of the House of Commons, giving compulsory running powers to the London United Tramways Company over certain lines to be purchased by the Council. The Committee added: "We feel that the success which has attended the Council's action in this matter is very largely due to the efforts of the members who spoke on behalf of the Council. Valuable assistance was also rendered by many of the local authorities owning tramway undertakings throughout the country."

## SOME USEFUL APPLIANCES.

The lifting and other appliances, most of them interesting to tramway engineers, manufactured by Messrs. Youngs, Ryland Street Works, Birmingham, have been well known for nearly 60 years. Their new patent worm screw pulley block, besides the well-known advantages attached to this system, possesses the quality long sought after: not only does the load remain suspended directly the hand chain is let go, but the speed of lowering can be controlled by pulling in the brake cord, and there is no danger of the load overpowering the brake, as



Axle Box Showing Jack Ready for Lifting.



Axle Box Showing Jack Extended.

Car Lifted by Two 5-Ton Jacks.

its power is always proportionate to the load. Of benders, this firm make a great variety, from the ordinary "Jim crow" for railway metals, to hydraulic and other benders, adapted to any section of tram rail or other bars. Their hydraulic car pit lifting jacks, forcing and wheel presses, drum pullers and armature pushers, and bushing presses, are very handy tools. This may also be said of their patent telescopic screw tramcar lifting jack (the use of which is shown in the accompanying illustrations), which can be run out to more than double its original height, while maintaining its stability. For instance, a 10-ton jack, measuring 8¼ in. high when down, can be extended to 18¾ in. when run out. A powerful tool is their "Duplex" iron punching and bonding press. The patent portable hydraulic bolt forcers, with weights ranging from 196 to 700 lb., exert a power of from 20 to 75 tons.

## FINANCIAL REPORTS.

**Hadfield's Steel Foundry Company.**—The directors recommend an interim dividend of 5 per cent., free of income tax, on the ordinary shares for the past half-year.

**The Bristol Tramways and Carriage Company, Limited.**—The directors have declared an interim dividend at the rate of 4 per cent. per annum for the half-year ended June 30.

**Oldham, Ashton, and Hyde Electric Tramway Company.**—The directors have declared an interim dividend at the rate of 5 per cent. per annum (5s. per share) on ordinary shares for the half-year.

**Liverpool Overhead Railway.**—The directors have declared interim dividends at the rate of 5 per cent. per annum on the preference shares, and 2½ per cent. per annum on the ordinary shares, for the half-year, against 2 per cent. per annum for the corresponding period last year.

**Increased Prosperity at Salford.**—The annual report of the general manager of the tramways, Mr. G. W. Holford, shows that the number of passengers carried was 50,113,120, as compared with 48,720,788 in the previous year. The receipts were £259,704, an increase of £6,389, and the mileage covered was 5,854,830, an increase of 46,461. The earnings per car-mile were 10·645d., and the energy consumption 1·60 units per car-mile, an increase of ·02, attributed to the addition of 20 covered bogie cars. The gross profit was £99,766, to which must be added the sum of £5,659 for interest on investments, etc , making a balance of £105,426.

**Lanarkshire Tramways.**—The general meeting was held in London on July 31, when Mr. A. R. Monks, chairman of the board, who presided, in moving the adoption of the report, said that the traffic receipts for the half-year showed an increase of £6,314, and the expenses an increase of £3,182 as compared with the receipts and expenses for the corresponding half-year of 1912. He referred to the action of the Lanark County Council in proceeding with the construction of tramways from Uddingston to Bellshill, Mossend, and New Stevenston. Part of these would be in operation by the end of August and the remainder by the end of October. The report was adopted.

**Millars' Timber and Trading Company.**—Presiding at the annual meeting, Dr. White said the profit was £157,034, which with the amount brought forward made a total of £186,285. After paying debenture interest, and putting £50,000 to depreciation reserve, there was a balance of £114,128, out of which they proposed to pay 5 per cent. on the ordinary shares, carrying forward £29,201. The volume of business and selling price of their hard wood had been well maintained, but the costs of production had increased. Outside the hard wood business they had done very well, and had acquired two subsidiary businesses. The saw mill plant in the Turkish beech forest near Salonika, though delayed by the war, would soon be at work.

**Sunderland Corporation Tramways.**—For the year 1912-13 the total traffic revenue was £68,507, as against £67,871 in 1912, and the net balance was £13,446, as against £13,063. The traffic receipts had risen from £17,578 in 1898 to £68,507, this figure having only once been exceeded—in 1908, when the receipts were £68,797. After paying interest on capital, £7,228, and income tax, £476, there was a balance of £22,498 to carry to the appropriation account. It was proposed to apply £10,366 to the repayment of loans, £7,218 to reserve and renewals fund, £400 to Wheat Sheaf offices, £352 to capital work, £476 to income tax, and £5,000 for the relief of the rates, this latter contribution making £42,027 given for this purpose since the Corporation took the system over. The amount in the reserves, renewals, and compensation fund was £31,883. The average working expenses per car-mile, including cost of power, amounted to 6·33d.

**Walter Scott, Limited.**—The trading profits for the year ended June 30 were £91,393, and £655 was brought forward. Debenture interest absorbs £12,000, and directors' fees £1,500. A final dividend of 7½ per cent. is proposed on the ordinary shares, making 10 per cent. for the twelve months, adding £24,676 to the reserve funds, writing £6,750 off investments, and carrying forward £1,623. The output at the steel works and collieries considerably improved, but the brick and cement works remained languid owing to the stagnation in the building trade. The trading profits for 1911-12 were £55,552, for 1910-11 £45,536, for 1909-10 £49,537, and 1908-9 £9,830. Twelve months ago two years' dividends were paid on the preference shares and £10,428 reserved. In 1911 and 1910 a year's dividend was paid on those shares, sums of £10,121 and £17,537 set aside, and £5,027 and £1,112 carried forward, but in 1909 no distribution was made, £682 remaining after providing for debenture interest.

**Tyneside Tramways and Tramroads Company.**—The half-yearly meeting was held in Newcastle on August 11, when Dr. J. T. Merz, chairman, who presided, said that there had been an appreciable increase in the revenue and the dividend. The traffic receipts showed an increase of £1,049, and the surplus of receipts over expenses amounted to £5,446. The available balance was £4,864. This has been appropriated as follows: Dividend on preference shares at the rate of 5 per cent. per annum, £601; dividend on the ordinary shares at the rate of 3 per cent. per annum, £2,008; to reserve for renewals, depreciation, etc., £1,200; reduction of registration and formation expenses, £330; leaving £724 to be carried forward. The chairman intimated that the directors had decided to invest the large balance in hand in trust securities to yield 4 per cent. per annum. It appeared from the report that the amount at the credit of reserve for renewals, depreciation, and other contingencies was £14,538.

**Kalgoorlie Electric Tramways.**—Mr. Allen H. P. Stoneham, chairman, presiding at the annual meeting of the Kalgoorlie Electric Tramways, Limited, said that the accounts were not so satisfactory as could be wished, owing in a great measure to the depressed state of business, and to fewer men being employed in the mines. Wages were higher, and, consequently, while the receipts had gone down the expenses had gone up. The manager, Mr. Stanley, worked extremely hard, and was assiduous in his service, but the position was very difficult owing to labour demands. Mr. Stanley was to be highly complimented on the way he had conducted the company's case before the Arbitration Court. They had expected that the trans-continental railway would help them. The work had been commenced, but in a very half-hearted way, and so far it had not benefited Kalgoorlie. They had hopes that before very long the idea of nationalising everything would extend as far as Kalgoorlie, and the Government would make an offer to purchase the tramways in the same way as had been done at Perth.

**Brush Electrical Engineering Company.**—Mr. E. Garcke, who presided at the 24th ordinary general meeting, said that he regretted that the reorganisation scheme had not resulted in at least an equilibrium between the expenses and the receipts. If it had not been for the miners' and other strikes the result of the year's working would have been much better. They were engaged on contracts for the Admiralty at Portsmouth, Chatham, and Rosyth. In pursuance of the policy to keep abreast of the latest improvements in steam turbines, they had identified themselves with the Ljungstrom turbine, a Swedish invention, which had been very carefully worked out and tested. The first set of this type—a turbo-alternator of 1,500 H.P. capacity—was put in service a couple of months ago at the power-house of the North Metropolitan Electric Power Supply Company. They had orders in hand and in immediate prospect for these machines, and were looking forward to a large demand for turbines of this size. On the rolling stock side they had besides the usual standard lines of tramcars and trucks, railway passenger coaches and wagons, turned out considerable numbers of motor-omnibus bodies of different types, but principally for service in the metropolitan area. Practically the whole of the bodies on the blue Metropolitan Electric Tramways omnibuses, which were now running on the London streets, were their make. This was a line of manufacture for which they were specially well equipped, and in which they hoped to continue to do good business. The company were greatly indebted to the managing director (Mr. Broadhurst) and to all the staff for the extraordinary efforts which they were exercising to improve the position of the company.

## CAR REPAIR COSTS.

Some time ago Mr. N. J. Young, general manager of the Newport Corporation tramways department, obtained information in reference to the cost of car repairs on various tramways, and the statement is included as an appendix to his annual report. We give below the figures for the last two years:

| Name of Town. | Total Number of Cars. | | Total Cost of Car Repairs and Maintenance per Car per Annum. | |
|---|---|---|---|---|
| | 1910-11. | 1911-12. | 1910-11. | 1911-12. |
| | | | £ | £ |
| Aberdeen ... ... (14) | 71 | 71 | 35 | 35 |

## PERSONAL.

**Mr. R. Leigh Griffin** arrived at Southampton on August 9 from Santos on three months' leave.

**Mr. F. P. Seager** has been appointed shift engineer at Manchester at a commencing salary of £175.

**The late Mr. James Watts Courtenay** left estate of the gross value of £85,832; net personalty, £71,064.

**Mr. Robert Hammond** left England on August 30 on a visit to South Africa, sailing on the "Edinburgh Castle."

**Mr. W. E. Read,** of the Burton Corporation Tramways, has had his salary increased from £130 to £140 per annum.

**Mr. V. Hutchinson,** formerly of Hobart, has been appointed electrical engineer to the Brunswick Municipality (Vic.).

**Mr. H. F. Ellis,** electrical engineer, of South Shields, has been granted an increase in salary of £50, to £450 per annum.

**Mr. J. W. Dawson,** city surveyor of Bradford, has been voted an increase in salary of £100, and a further addition of £50 next year.

**Mr. G. B. Wheeler,** of Southport electricity works, has been appointed chief assistant engineer at the Hamilton electricity works.

**Mr. H. Greaves** has been appointed buyer to Ferranti, Limited, in the place of Mr. J. Robinson, who has resigned owing to ill-health.

**Mr. J. H. Cowell,** manager, Blackburn Corporation, has been given an increase of his salary from £400 to £500 by yearly increments of £25.

**Mr. G. G. Deely** has been appointed senior charge engineer at Southport electricity works, and Mr. S. Pendlebury as assistant mains superintendent.

**Mr. L. J. Kettle,** deputy city electrical engineer to Dublin Corporation, has had his salary raised from £400 to £600 by increments of £50 per annum.

**Mr. A. Lees,** a motorman in the Ashton-under-Lyne Corporation tramways department, has been appointed cash clerk and ticket inspector out of a number of applicants.

**Mr. Hamylton Rigg** has resigned his position as sales engineer to the Electrical Power Storage Company, to take up similar duties with Edison Accumulators, Limited, of 49, Old Bond Street.

**Mr. R. S. Pilcher,** general manager and engineer of Aberdeen Corporation Tramways, has been granted an increase of salary from £400 to £450, with further annual increases of £25 to £500.

**Colonel Sir Arthur Yorke,** late chief inspecting officer of railways to the Board of Trade, has been appointed a director of the London, Chatham, and Dover Railway, in the place of the late Mr. G. Wyndham, M.P.

**Mr. T. R. Smith,** chief electrical engineer at Leicester, has been granted an increase in his salary from £600 per annum to £700 as from January 1, 1913, to £800 from January 1, 1914, and to £900 from January 1, 1915.

**Mr. James Dalrymple,** general manager of the Glasgow Corporation Tramways, and Mr. Thomas Nisbet, master of works, sailed for New York on August 9, by the Anchor liner *Cameronia*, with the object of studying American tramway methods.

**Mr. L. C. F. Bellamy,** borough electrical engineer and tramways manager of Ilkeston, has been presented by the employees of the tramways and electricity departments with a pair of handsome copper curbs and fire appliances, on the occasion of his marriage.

**Mr. J. W. Cockrill,** borough engineer, Great Yarmouth, was presented with a silver bowl during the recent conference of the Institution of Municipal and County Engineers in that town by the members of the Corporation and his brother officers in recognition of his election as president of the Institution.

**Mr. G. F. Upcott** has been appointed chief inspector of Walthamstow Council tramways, at a salary of £130, rising by annual increments of £10 to £160 per annum. Mr. Upcott was an inspector on the Leyton Council tramways, and was for a number of years employed by the old North Metropolitan Tramways Company. There were 102 applicants for the position.

**Mr. George Webster,** who has been appointed general manager of the Rochdale Corporation Tramways, will receive a salary of £350 per annum, rising by two annual increases of £25 to £400. Mr. F. Ogden has been appointed chief clerk, Mr. Richard Bentley chief traffic assistant, Mr. Sidgwick rolling stock superintendent, and Mr. George Philipson overhead equipment superintendent.

**Mr. J. R. Mead,** the new borough surveyor of Ipswich, was formerly with the borough engineer of Burton-on-Trent, where he had considerable experience in tramway renewals and extensions. This experience served him in good stead from 1905 to 1911 while holding the position of general engineering assistant to the borough engineer of Birkenhead. From 1911 to the present time he had been deputy engineer of St. Helens.

**Messrs. P. J. McIntosh and W. G. Ross** have been added to the directorate of the Montreal Tramways Company, thus increasing the board from seven to nine members. Mr. McIntosh is in touch with the financiers in New York and Boston, whose association has been so useful to the board. He is also confidential assistant to Mr. W. Rockefeller. In Mr. Ross, who was managing director for many years, the board have the benefit of the advice of one who thoroughly understands the requirements of the company and its patrons.

**Bailie W. B. Smith and Mr. W. W. Lackie,** convener of the Glasgow electricity department and chief engineer of the electricity department respectively, arrived at Montreal on August 24 and proceeded to Toronto to view the generating plant at Niagara Falls. Afterwards they intended to examine several large power-stations at Chicago and thereafter proceed to Pittsburg, where Bailie Smith will attend a conference on smoke abatement. After a visit to the works of the G.E.C. and Westinghouse Companies they will travel to New York to inspect power-stations, arriving at Glasgow towards the end of the first week in October.

**Mr. G. M. O. Scott,** who was selected by the directors of the Ceará Tramway, Light, and Power Company as general manager, is now in Ceará acting as manager for the existing mule tramways during the construction of the new undertaking. He is also employed by the contractors in connection with the latter work, in order to preserve as far as possible, continuity in the technical and business management of the company. It was reported by Mr. C. Hunt, who presided at the annual meeting, that the works were proceeding satisfactorily, and that indications were that the receipts would be more than were originally anticipated by the consulting engineers.

**Alderman Fred Smith,** chairman of the Liverpool Tramways Committee, replying to correspondence evoked by his letter to the newspapers on the report of the Select Committee of the House of Commons on London Motor Traffic, says: "In the days of the horse tramcar in Liverpool one person was killed by that system for each 6,000,000 carried, whilst with the quicker electric service under municipal control for the 10 years ending December 31, 1912, only one person was killed for each 22,000,000 carried. Further, may I add the interesting fact that as the committee gained experience the cost of accidents was practically reduced in 1912 to one-fourth of its cost in 1908."

**Mr. J. S. D. Moffet,** who is vacating the position of manager of the Rochdale Corporation Tramways, to take charge of the West Ham undertaking, has been presented by the employees at Rochdale with a handsome silver double entree dish and a silver hot water jug. Inspector Venting, in handing the gifts to Mr. and Mrs. Moffet, said that the presents were a token of the respect which the employees felt for Mr. Moffet, who had been manager since 1904. In replying, Mr. Moffet said that the system had grown into a large and important undertaking, and he was proud of all branches of the service. He was glad to think that, in spite of any dispute which had arisen during his management, there had always been a good feeling between himself and the employees. Several other speakers referred appreciatively to Mr. and Mrs. Moffet's interest in the various branches of the undertaking.

**Mr. A. T. Lambert,** general manager and electrical engineer, Maidstone Corporation Tramways, was made the subject of complimentary remarks at the opening of the new offices at the Barming depot on August 15. Councillor Lyle, chairman of the committee, in the course of observations made in calling upon the Mayor to open the new premises, observed that the offices had already paid for themselves in that the manager had, since their erection, always been on the spot, and able to direct the men of the depot in their work. Mr. Lambert worked hard to make the tramways a success. There were managers who could not tell the men in the workshop what to do, but Mr. Lambert was not a manager of that stamp. He not only knew how to do the work but showed the men how to do it. The Mayor (Councillor Potter) agreed that in Mr. Lambert they had a clever engineer, and one who thoroughly understood his work. The Council wanted him, with the chairman of the committee, to be master of the whole concern.

**Mr. George Herman Anger,** managing director of the Anger Manufacturing and Supply Company, of Bank Chambers, Preston, will sail for New York on October 4 by the "Lusitania." The Anger Company are the manufacturers of the Anger improved automatic brake adjuster, a device which is now in use on 125 tramways representing nearly every country of the world. Mr. Anger goes to the United States to attend the convention and exhibition of the Electric Railway Association of the United States, which will be held at Atlantic City from October 11 to 19. The Anger brake adjuster will be shown there by the Ackley Brake and Supply Company of Church Street, New York City, the sole manufacturers and selling agents for the Anger improved automatic brake adjuster in U.S.A., Cuba, Porto Rico, Mexico, Central America, Venezuela, the Phillipine Islands, and the West Indies. After the convention Mr. Anger will visit various tramways in Canada, making his head-quarters at the company's Toronto office, and will return to England about November 1.

Digitized by Google

**Bombay Tramways Officials.**—Sir Charles Ollivant, who presided at the annual meeting of Bombay Tramways and Electric Supply Company, remarked that the company were greatly indebted to the experience, ability, and zealous supervision of the managing director, Mr. Rimington, and no less fortunate in having had a chief engineer with the conspicuous professional attainments and business ability of Mr. Cooper. As the principal local representative of the company, his unfailing tact and courtesy had been appreciated by all, and, under the direction and influence of these leaders, a very efficient staff had been organised, whose excellent service merited warm approbation. It gave the directors great pleasure to see present one of the officials who had been associated with the undertaking from its commencement. He was highly appreciated by the managing director of the old horse tramway company, and had since been appreciated highly by Mr. Rimington, he referred to Mr. Pestonji Mahaluxmiwala. A dividend of 5 per cent. on the ordinary shares, free of English income tax, was declared.

**Mr. T. B. Goodyer,** general manager, Croydon Corporation Tramways, has on several occasions received commendation for the work he has accomplished for the tramway undertaking against the competition of the motor omnibuses. In 1909-10 the latter vehicles were inferior to those now in use, and on the London tramways being extended to the Croydon boundary the omnibuses gave up the fight. Now the vehicles of the London General Omnibus Company, the British, and the Metropolitan Electric Tramways Companies are working the main London and Croydon route under the direction of the first-named, while from East London the petrol-electric vehicles of Thos. Tilling, Limited, make further competition for the tramways. Councillor Denning, chairman of the Tramways Committee, in moving the adoption of the manager's report for the year 1912-13 at a recent meeting of the Council, remarked that Mr. Goodyer started the document by saying he had great pleasure in submitting the annual report. Mr. Goodyer might have said he had pleasure and pride in submitting it. The report did him very great credit. He doubted if a more exhaustive or a more reasonable report, dealing with the matter from every point of view, had been presented to that Council. No man could be more receptive of ideas, more interested in his work, or more desirous of doing everything he could for the department than Mr. Goodyer.

## NEW AND PROSPECTIVE WORK.

CANADA.—It is reported from Canada that the Canadian Pacific Railway is about to commence the construction of an electrical line from Hamilton to Niagara Falls. By its construction the Canadian Pacific Railway will be in a position to handle traffic direct from Hamilton to Buffalo on their own lines, and it will be no longer necessary to run traffic over the routes of other companies.

DONCASTER.—The Town Council have agreed to purchase six additional tramcars at an estimated cost of £5,000, and to enlarge the car shed at a cost of £750. The question of buying six or eight motor omnibuses to run between Doncaster and outlying districts is being considered.

DUBLIN.—The Tramways Company have decided to at once relay some of the lines which they had not intended to proceed with until next year. The reason for the decision is the greater dearth of employment in the city for casual labour.

DUNDEE.—The Tramways Committee have authorised the manager, Mr. Peter Fisher, to obtain tenders for four additional cars, in view of the extension of the tramways to Broughty Ferry, and to equip all the cars on the system with wire mats, at a cost of £3 18s. per car.

DUNFERMLINE.—The Dunfermline District Tramway Company have decided to carry their tramway system through Dunfermline to the western boundary of the burgh. When the company obtained their powers it was a condition that they pay the Corporation £100 per mile in respect of the upkeep of the tramway track. As an incentive to the company to carry out the extension the Council have agreed to reduce the payment to £60 for a period of five years.

FELIXSTOWE.—Mr. H. R. Hooper, on behalf of the Local Government Board, has held an inquiry into the application of the Felixstowe Urban District Council for sanction to borrow £4,729 for the extension of the electric supply plant, by the provision of a 150-KW. Diesel generating set. The inspector elicited the fact that the Diesel set was required to supersede some old gas engines, and after discussion it was decided to amend the application, the sum asked in revision being £2,800.

IPSWICH (QUEENSLAND).—The Iron and Coke Company propose to install electric tramways, and to erect a power-house at West Ipswich to supply current for lighting and power purposes to private consumers.

KILKENNY.—The scheme for a broad gauge railway from Castlecomer to Kilkenny to serve the projected coal mines has given place to a proposal for the construction of a light railway instead at an estimated cost of £40,000, including rolling stock. The line is to be laid alongside the public road, taking 4 ft. off the present width of 26 ft., the rails to be protected by a kerbing raised from six to nine inches on each side. Mr. Ryan is the engineer.

LEEDS.—The Leeds Sub-Tramways and Electricity Extension Committee has recommended that application should be made for power to carry out a number of tramway and railless trolley route extensions. The estimated cost of these is £190,000.

MORECAMBE.—The Town Council on August 19 agreed that the electrical engineer should prepare a scheme for the electrification of the tramways.

NORTHAMPTON.—A scheme has been arranged for the extension of the tramways to the Far Cotton suburb as soon as the work of reconstructing the South Bridge has been completed in the near future and Bridge Street has been widened.

READING.—The Council have decided to promote a railless trolley bill in the next session of Parliament.

ROTHERHAM.—The Council have accepted the tender of Chadwick and Company for the extension of the car sheds in Rawmarsh Road at £11,643. The Council propose to apply to the Board of Trade for a Provisional Order authorising the construction of electric tramways along the new street in Millgate and adjoining streets, so as to connect the route with the present tramways.

SOUTH SHIELDS.—£30,000 is to be borrowed by the Corporation for the purpose of installing a new generating set and other plant at the electricity works.

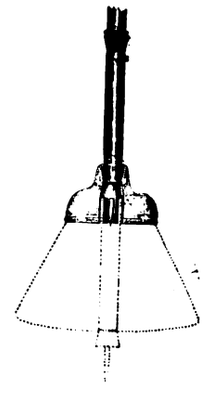
STIRLING.—The Council have decided to consider a proposal made by Mr. George Balfour, of Messrs. Balfour, Beatty, and Company, London, to acquire the Stirling and Bridge of Allan Tramways and to apply for powers to enable them to reconstruct and electrify the lines. Mr. Balfour states that he could only carry out the scheme on condition that he was able to acquire the electricity works from the Corporation, when he would reduce the charge for domestic and public lighting.

WELLINGTON (N.Z.).—The tramways department's estimates for the current year provide for an expenditure of £34,800 on new works, including £9,264 for new cars, £5,020 for a new boiler and other plant for the power-station, and £5,164 for car shed extension.

WIGAN.—The Tramways Committee propose to ask the Council to sanction the borrowing of money for the purpose of buying six up-to-date cars.

## A CAR "TIDY."

Messrs. Leopold, Turners, and Workers, 124-7, Leopold Street, Birmingham, have brought out an excellent device which will come as a "boon and a blessing" not only to tramway conductors, but to those who ride in the cars. At present, and until used tickets are systematically and rigidly collected, they litter the cars, and it is anything but pleasant to come into one where these dirty bits of cardboard almost cover the seats and the floor on which they have been shuffled about by dirty boots. It is a still more unpleasant task to collect them with the fingers, and it is no wonder that the filthy task is shirked by the men, and that their hands are often so grimy as to be positively disgusting. The "tidy" we illustrate will obviate all these evils, for it can be used as a brush, and also as a rag-pick to collect all refuse, not only in and on the cars themselves, but in waiting rooms, shelters, heavy unloading stations, car sheds, etc. The price is only 5s., including carriage to any part of the United Kingdom.



## HOBART MUNICIPAL TRAMWAYS.

The Hobart (Tasmania) tramway system, which has been taken over by the City Council, was constructed by Messrs. Siemens Brothers and Company, and was described in the TRAMWAY AND RAILWAY WORLD of January, 1895. The present manager, Mr. A. C. Parker, went out as the representative of Messrs. Siemens Brothers, and under his supervision the first cars started running in November, 1893. In the following year the undertaking was handed over to the Hobart Electric Tramway Company. The service was begun with about 20 cars, of which 10 are still in service. The power-station equipment has been extended, and during the last four years two 300 KW. sets have been installed, with one of the latest Babcock and Wilcox tubular boilers, with automatic stoking appliances. During the whole of the 20 years that the line has been in operation only one fatal accident has occurred, a record which probably has not been equalled in the history of electric tramways.

## CONTRACTS AND ORDERS.

**Vickers, Limited,** have an order for 125 tramcar wheel tyres from Sheffield Corporation.

**Mr. G. F. Tomlinson** has received a contract for doubling tramways at Derby, at £2,632.

**Chamberlain and Hookham, Limited,** have received a contract from Falkirk for A.C. meters.

**Bayliss, Jones, and Bayliss, Limited,** have an order for tie bars from Salford Corporation Tramways.

**C. Richards and Sons** have an order from Salford Corporation for single-ended tie bars for tramways.

**The Electric Construction Company, Limited,** have received an order for a booster from Bolton Corporation.

**Walter Scott, Limited,** are supplying steel rails and fish plates for relaying the track in Manchester Road, Bolton.

**Doncaster Tramways Committee** have accepted the tender of Arnold and Son, at £2,524, for extending the car shed.

**Peterborough Council** have allotted a contract to Crompton and Company, Chelmsford, for a new switchboard, at £576.

**Eccles Council** have awarded a contract to the Triumph Stoker, Limited, to equip four boilers with their mechanical stoker.

**W. S. Laycock, Limited,** have supplied rollers and blinds to Walsall Corporation for cars now being fitted with vestibules.

**Watlington and Company, Limited,** have an order from Stockport Corporation Tramways Committee for pressed-steel gear cases.

**Chamberlain and Hookham, Limted,** have received a contract from Rotherham for meters of 10 amperes capacity and upwards.

**Sheffield Corporation** have placed an order with Messrs. Longbottom and Company for coal for the generating station at 9s. 11d. per ton.

**Siemens Brothers and Company, Limited,** will supply a high-tension switchboard to Bexley Urban District Council, at a price of £867.

**Hillman Motor Car Company** have obtained a contract to supply a motor lorry to the electricity department of Willesden Urban Council.

**Keighley Council** have accepted the tender of Ed. Bennis and Company for the supply and erection of a Bennis stoker to a Lancashire boiler, at £130.

**Huddersfield Council** have placed contracts with J. Proctor, Limited, for a coal elevator, and with J. Moody and Son for a hydraulic hoist.

**Crompton and Company, Limited,** are supplying a direct-current switchboard at Salisbury Road sub-station for the Willesden District Council.

**The United Electric Car Company, Limited,** have received an order for two top-deck covers for tramcars from Lancaster Tramways Committee.

**Glasgow Council** have accepted the tenders of the Lorain Steel Company and Hadfield's Steel Foundry Company for the supply of special trackwork.

**The Electric Construction Company** have received a contract from Blackburn Corporation for the supply of electric motors for the electricity department.

**The Atlas Resilient Road Wheel Company, Limited,** have received an order from Stockport Corporation for a set of spare wheels for trackless trolley vehicles.

**Tudor Accumulator Company, Limited,** have obtained a contract for the repair and maintenance of the battery at the Heywood Corporation electricity works.

**The Belfast Tramways and Electricity Committee** has accepted the tender of Bertram Thomas, of Manchester, for a switchboard panel for the electricity works.

**A. Graham and Sons,** of Longroyd Bridge, have received a contract for the widening of Long Wall, Huddersfield, in connection with the West Vale tramway extension.

**Edgar Allen and Company, Limited,** are to supply six 15 ft. lengths of manganese rail, with fish plates, bolts, etc., for a section of the Temple Mills curve of the Leyton tramways.

**Newport Council** have accepted the tender of Mr. Bertram Thomas for the supply of switch gear at £168, and of Mr. R. W. Moon for the erection of a switch and motor house, at £599.

**Bolton Electricity Committee** has accepted the tender of Stewarts and Lloyds for steam and hot water pipes for their new station, and of Wm. Pollett and Company for the laying of conduits.

**The Lea Recorder Company, Limited,** will supply and erect a combined indicator and recording water meter, including tank and float chamber, for Sheffield Corporation. The contract amounts to £880.

**Manchester Corporation Tramways Committee** have accepted tenders for tramcar trucks from the Brush Electrical Engineering Company, and for tramcar wheel centres from Edgar Allen and Company.

**The British Insulated and Helsby Cables, Limited,** have a contract from Burnley Corporation for the supply of cables. They are also supplying 6,000-volt overhead three-phase line to Halifax Corporation.

**The Brush Electrical Engineering Company's** tender for 25 double-deck top-covered extended canopy cars has been accepted by Sheffield Corporation at £640 per car, plus 5 per cent. for contingencies.

**Messrs. J. W. Courtenay, Limited,** of London, have been awarded the contract for the advertising on the cars of the Aberdeen Corporation Tramways for the ensuing five years. It was stated that the tender of Messrs. Courtenay, Limited, was the highest of the offers received.

**John Taylor,** of 7, Strand Street, Liverpool, has received orders from Manchester Corporation for 120 tubular sanding devices, and from the Brush Electrical Engineering Company for 100 tubular sanding devices for use on the new cars they are now building for Sheffield Corporation.

**Burnley Corporation** have accepted the tender of the British Westinghouse Electric and Manufacturing Company for a turbo-alternator, rotary converters, switch gear, etc., at £12,860, and the tender of the Electrical Company for 70 tramcar watt-hour meters mounted on special spring frames.

**Aberdeen Council** have accepted tenders as follow: For the clothing of the tramway employees for the next two years: Uniforms, Moore, Taggart, and Company, Glasgow; hats, Perry and Company, Halifax; inspectors' waterproofs, the London Rubber Company; motormen's waterproofs, Steele and Company, Aberdeen.

**Sunderland Council** have placed contracts as follow: Hadfield's Steel Foundry Company, relaying a manganese railway and tramway crossing; Tudor Accumulator Company, Limited, welding 500 tramway rail joints; British Insulated and Helsby Cables, Limited, and I.R. and G.P. Company, cables; Ferranti, Limited, meters.

**Chesterfield Council** have placed contracts as appended: Marsden Brothers, sub-station, Whittington Moor, £205; Chas. Ross, Limited, girders for switch gallery, £44; B.I. and Helsby Cables, Limited, 1,200 yards low-tension triple-concentric armoured cable, £294; Brush Electrical Engineering Company, Limited, two trailer car bodies, £80 each.

**The Railway Track Supply Company of Great Britain,** 81, Gracechurch Street, London, E.C., have recently received an order for 20,000 "Vaughan" rail anchors for the South Manchurian Railways. They have a large number of orders on hand all over the world for these rail anchors, for which they hold the sole licence to manufacture and sell in Great Britain and the British Colonies.

**Warner Trucks.**—The M. and G. Truck and Engineering Company, British licensees for the Warner non-parallel axle truck, have received three repeat orders from the Colombo tramways for vehicles of this class. The first car of the kind, which was sent out in 1910, and was illustrated in our issue of January, 1913, has proved completely satisfactory, and is noted for smooth running and reliability.

**London County Council** have accepted the following tenders: Dick, Kerr and Company, reconstruction of horse tramways in Ball's Pond Road at rates contained in a previous tender; Spagnoletti, Limited, switch gear for Shoreditch, Camberwell, and Woolwich sub-stations and the central car repair depot, £999 14s.; Frederick Smith and Company, five miles of 4/0 grooved trolley wire, £93 6s. 8d per mile (or £81 13s. 4d. per ton), less 2½ per cent. discount.

**Bradford City Council** has accepted the following tenders as extensions of, and at the same prices as, existing contracts: Siemens Brothers Dynamo Works, Limited, 100 tramway motors, 50 resistance sets, and 100 circuit breakers; Dick, Kerr and Company, Limited, 100 D.B. form K4 tramway controllers; Hurst, Nelson, and Company, Limited, 50 tramway trucks; Cole, Marchant, and Morley, 50 power brake sets; Collier Brothers, 30 miles 0000 grooved copper trolley wire, at £2,698.

**Johnson and Phillips, Limited,** have secured the following orders for their standard type oil-cooled transformers during the last few weeks: Two 625 k.v.a., 6,600 v., for Dundee Corporation; two 150 k.v.a., 6,000 v., for Wigan Corporation; one 500 k.v.a., 6,600 v., for Oldham Corporation; three 100 k.v.a., 2,000 v., for the Admiralty; fifty-one 50 k.v.a. and three 300 k.v.a., 13,200 v., for Canada; four 400 k.v.a., 10,000 v., for Japan; two 350 k.v.a., 6,000 v., for Brazil. The Company have also secured contracts for upwards of 5,000 k.v.a. in transformers for English machinery makers in connection with converting plants, etc.

**First-class Cars to the Theatre.**—Patrons of the first-class cars in Liverpool are appealing for more cars, so that they can get to and from the theatres. Most of the first-class cars cease running at eight at night.

Digitized by Google

## TRAMWAY AND LIGHT RAILWAY NOTES.

**BIRMINGHAM.**—There is a suggestion that the Corporation should follow the example of Dresden and put trailers on some of the tramcars for the purpose of carrying luggage. The chairman of the Tramways Committee explains that any such scheme would have to be carefully prepared and organised, and he fears that luggage trailers would cause delay.

**DUBLIN.**—Without discussion the Dublin Corporation on August 18 adopted a resolution, drawn up in the best debating society style, instructing the law agent and the town clerk to report on the steps to be taken in order to acquire the tramways undertaking.

**GLASGOW.**—The Corporation is considering the appointment of a special committee, which will be charged with the duty of reporting on a scheme of electric tube railways between the east and west of the city. Assuming that there are no further extensions, the tramways will be free from debt within four years. After this time the annual surplus should be a very large one, amounting from £200,000 to £400,000, and a writer in the *Glasgow Evening News* asks how this large sum will be disposed of. Hitherto very liberal allowances have been made to the depreciation and reserve accounts, so that no less a sum than £2,040,000 stands at the credit of the depreciation and permanent way renewal funds. Of that amount £1,852,500 is invested with the Common Good.—Consideration was given by the City Council on August 14 to a recommendation by the Tramways Committee that application be made for Parliamentary powers to enable them to remove obstructions from the tramway lines, and where it could be shown that the obstruction was due "to the overloading of the vehicle, or to negligence in the construction or maintenance thereof," for powers to charge for the cost of the removal, and the loss occasioned by the interruption. On a motion to disapprove of the recommendation being proposed and seconded, Bailie Alston said the committee were only seeking powers to recoup themselves for having to bring the apparatus for removing obstructions from the depot. It was in the interests of other users of the streets that obstructions should be removed as speedily as possible. The minute was disapproved by a large majority.

**GREENOCK.**—Councillor Mitchell has given notice to move at the next meeting of the Corporation that the town clerk give due and further notice to the Greenock and Port-Glasgow Tramways Company that the Corporation have decided to exercise the option they are entitled to in terms of the lease to terminate such lease on the first break namely, May 15, 1914.

**LIVERPOOL.**—Representatives of the Glasgow tramways recently visited Liverpool and inspected the car designed by Mr. Mallins, having a separate entrance and exit on the platform. A Glasgow journal says: "It is understood that the Liverpool management is delighted with the experiment, and that at least a score of the new cars have been ordered. Nevertheless, it is a moot point whether the latest type would suit the unrivalled rushes which are made at the car stations in central Glasgow at least." The cars were described and illustrated in our issue of November 12, 1912.

**LONDON.**—One of the provisions of the London County Council Tramways Bill, 1913, would have allowed them to charge up to a maximum of one penny per mile over their whole system, and any fraction of a mile may be deemed a mile. Giving evidence in support of the proposal, Mr. Fell, chief officer of the tramways, stated that if the Council got the power they sought they did not propose to charge the maximum fares. They were now the cheapest carriers in the London area, and they had halfpenny fares and very cheap workmen's fares on all their sections. As an example of this, he gave the instance of a 19-mile ride for twopence from Tooting to Hop Exchange and back. An agreement having been arrived at under which no alteration would be made in the existing rate of a penny for from 3½ to 5 miles on the lines to be taken over from the London United Tramways Company, the clause was allowed.—Progress is being made with the work of fixing route numbers, with the necessary equipment for illumination at night, on the electric cars of the London County Council. The back portion of the illuminated boxes is being utilised as advertisement spaces.

**MANCHESTER.**—The number of tramway passengers in Manchester on the occasion of the recent Royal visit amounted to 825,703, the receipts constituting a record, with the exception of August 3, 1908, when the takings were £4,144, and the passengers 698,013. Mr. J. M. McElroy, the general manager, has explained that the reason why the receipts were lower, although the number of passengers was higher, is due to the fact that there had been considerable reduction in the fares throughout the service. The figures for Monday, July 14, when the King visited Manchester, are the more remarkable, because for several hours during that day traffic in the centre of the city was stopped entirely, and the 110 cars were engaged in carrying school children to special stands. The number carried on that day was more than the entire population of Manchester, which, according to the last census return, was 714,333.

## THE MUNICIPAL TRAMWAY CONFERENCE.

The programme for the twelfth annual Conference of the Municipal Tramways Association, to be held in Sheffield from September 23 to 26, was issued just as we were going to press Omitting visits, excursions, etc., the following are the main items of the programme:

**TUESDAY, SEPTEMBER 23.**

8 p.m. Informal reception at the Royal Victoria Station Hotel.

**WEDNESDAY, SEPTEMBER 24.**

10 a.m. Meeting of the Executive Council.

10-15 a.m. Reception by the Lord Mayor and the Chairman of the Sheffield Tramways Committee.

10-30 a.m. Conference:

Presidential Address by Mr. A. R. Fearnley, general manager, Sheffield Corporation Tramways.

Paper: "Advantages and Disadvantages of Platform Fare Collection," by Mr. Alderman S. Flint, chairman, Leicester Corporation Tramways Committee.

1 p.m. Luncheon at the Grand Hotel, at the invitation of the Tramways Committee.

2-30 p.m. Resumption of Conference:

Paper: "The Maintenance of Paving on Tramway Track as affected by Section 28 of the Tramways Act, 1870," by Mr. Councillor W. C. Fenton.

10-30 p.m. Supper at the Town Hall on invitation of Lord Mayor.

**THURSDAY, SEPTEMBER 25.**

9-45 a.m. Meeting of the Executive Council.

10 a.m. Meeting of the Managers' Section.

10-30 a.m. Conference resumed:

Paper: "Urban Passenger Transport" by Mr. J. B. Hamilton, general manager, Leeds Tramways.

12-45 p.m. Luncheon at the Royal Victoria Station Hotel, at the invitation of the Tramways Committee.

2-30 p.m. Visits to Works.

7-0 p.m. Annual Association Dinner at Victoria Station Hotel.

**FRIDAY, SEPTEMBER 26.**

9 a.m. Meeting of the Executive Council.

9-30 a.m. Annual Business Meeting.

## PATENT LIST.

**Specially abstracted for "The Tramway and Railway World" from the Official Journal of Patents.**

*** If the inventions have been communicated the names of the communicators are given below in italics.

APPLICATIONS.

Applications for Letters Patent have been filed:

17,244 Motor omnibus life-guard—W. Knott.
17,257 Rail joints—C. Deppisch.
17,258 Vehicle wheels—C. Deppisch.
17,346 Life-guard for motor omnibuses, trams, etc.—R. Gribbin and R. Steward.
17,354 Motor omnibus guard—H. Luke.
17,357 Life-guard for motor omnibuses—J. E. Madsen.
17,540 Life-guard for motor omnibuses—A. H. Wilde.
17,607 Electrical systems—R. Varley.
17,618 Superheaters—J. H. Stirling and Schmidt's Superheating Company, Limited.
17,625 Generation of electrical power and systems of electrical transmission of same—W. P. Durtnall.
17,628 Life-saving apparatus for motor omnibuses—J. Joseph.
17,671 Life-saving apparatus for motor omnibuses—E. Harnett.
17,850 Trolley wheels—J. W. Anderson.
17,870 Metal railway ties—C. Anderson.

"Ailsa Coats are best and cheapest we have ever had."
"Motormen's Oilskins supplied by you gave every satisfaction."
"The oilskin coats we now use are entirely confined to the 'Ailsa' manufacture."
"We have tried several makes of Oilskins, but none have been equal to the 'Ailsa' make."
"Past results have been so satisfactory that we have this year decided to place the whole of our order in your hands."

17,917 Life-guard for motor omnibuses—P. Beston.
17,936 Car trucks—H. H. Hewitt.
17,940 Car trucks—H. H. Hewitt.
17,946 Car fenders—F. A. Nelson and E. T. Flateboe.
18,008 Train electric control systems—B. Starie.
18,019 Automatic signalling and alarm systems for railways—O. M. de Munnick.
18,106 Supplying current for electric devices for setting points of electric railways with sliding bow and roller bow arrangements—G. Breucker.
18,128 Railway safe running devices—A. R. Angus.
18,136 Railway rail joints—L. W. Williams.
18,181 Construction of omnibuses and tramcars—C. F. Newman.
18,210 Working of tramway and like vehicular systems—P. H. Carter.
18,250 Trolleys for electric tramcars—H. H. S. Farmer.
18,287 Guard for tramcars—S. Cromarty.
18,316 Fluid pressure braking apparatus for electric railways—J. W. Cloud.
18,345 Automatic air-brake apparatus—W. D. Aird.
18,485 Motor omnibuses—J. A. Hope.
18,544 Reinforced concrete beds or sleepers for permanent way—J. Rank, F. Rank, and L. Rank.
18,601 Double-decked cars—L. Spangler.
18,602 Double-decked cars—L. Spangler.
18,664 Vacuum brake apparatus—E. S. Luard.
18,684 Seats for trams and motor omnibuses—A. L. Barber.
18,695 Arresting the side slipping or skidding of motor omnibuses—W. H. Knowles and W. F. Goreham.
18,723 Rail joints—J. E. McCoy and W. H. Bowersot.
18,790 Construction of anti-friction mechanism as applied to axle shafts of tramcar trucks—J. E. Cooper.
18,814 Guards for motor omnibuses—F. J. Zelzer.
18,882 Railway switch operating apparatus—L. W. Williams and O. R. Williams *(A. Lines and C. B. Lines)*.
18,914 Sleepers for railway tracks—L. Beyer.
18,916 Appliance for the protection of exposed seats on omnibuses—G. D. Sweetman.
19,019 Train signalling and control systems—F. W. Prentice and B. Starie.
19,020 Train signalling and control systems—F. W. Prentice and B. Starie.
19,056 Safety guard for motor omnibus front steering wheels—J. Pinder.
19,076 Seats for omnibuses and tramway cars—H. F. Keen.
19,101 Rail joints—M. Surtig, J. Briar, and J. Meno.
19,144 Automatic stopping railway trains—G. H. Hallett, junior.

## Specifications Published.

1912.

16,501 Brake apparatus for railway vehicles—Luard.
23,371 Axle bearings—Stephens.
13,695 Contact fingers for electric controllers—Dyer.
16,534 Track apparatus for operating railway signals—Ducellier and Guillou.
16,851 Railway motor coaches—Thomas and Thomas Transmission, Limited.
19,612 Railroad ties and braces—Borger.
25,111 Rail joints—Blessing.
17,671 Compound railway rails—Weeber.
18,209 Means for securing rail wedges in railway chairs—Jones.
20,446 Electric traction systems—Pollak *(Electro-Motoren-Werke Hermann Gradenwitz)*.
24,384 Joints of switches for overhead trolley ways—Straiton.
26,145 Devices for electrically operating tramway points—Davidson.
17,130 Electric power transmission—Thomas and Thomas Transmission, Limited.
17,306 Control of electrically-operated self-propelled vehicles—Van Daalen and Schreiber.
17,699 Locomotives—Lipetz and Magid.
17,749 Method of and apparatus for electric welding—Haddan *(Cleveland Welding and Manufacturing Company)*.
19,458 Bodies of motor omnibuses—Crane and London General Omnibus Company.
29,683 Steam superheating—De Ferranti.

1913.

3,380 Rail joints—Vietor.
5,092 Automatic train control and signalling system—Kerr.
5,210 Street cars—Hedley and Doyle.
1,179 Method of and apparatus for uniting railway and tramway rails—Th. Goldschmidt Akt.-Ges.
2,811 Apparatus for sanding railway and tramway rails—Lambert.
7,556 Car brakes—Rochambeau.
12,841 Power transmission and control apparatus on motor vehicles—Thomas and Thomas Transmission, Limited.
3,371 Trolley wheels—Anderson.
6,504 Journal boxes for railway vehicles—Berg.
7,094 Rail joints—Barnhill.

If our system of Parliamentary Government is not to become a mockery, the Cabinet should at once take steps to show that the report of the Select Committee on power-driven traffic in the metropolis is to be brought under immediate consideration with a view either to the carrying out of such of their recommendations as may be deemed advisable or a combination of the same in conjunction with the report of the Royal Commission. Thanks to the policy of drift, which has been followed since the latter body reported in 1905, after investigations which cost the taxpayers a sum of £26,672, the matter has become so urgent that it would be criminal to allow another lengthy period of inactivity to intervene. The departments chiefly concerned are the Home Office, the Board of Trade, and the Local Government Board, the greatest degree of responsibility resting upon the minister who has to sustain the worry of the militant suffrage agitation, the police and prison system of the country, and a multitude of other affairs. This in itself affords sufficient ground for separating London traffic from the medley of duties appertaining to the headship of the Home Office. The same contention holds good as regards his chief executive officer, the Commissioner of Police, even though, as far as circumstances permit, the latter has built up an efficient public carriage licensing department that, with the assistance of a technical adviser, has gained credit for eliminating from the petrol-driven vehicle the objections which four years ago prevented it from becoming the indispensable factor in metropolitan traffic which it is to-day. The good-will of the motor omnibus companies, and of manufacturers eager to secure the best results from their vehicles, has been no small contributory cause towards enabling the police to impose regulations regarding construction which were not justified by their powers.

---

In return for the work which the public carriage department at Scotland Yard have accomplished there can be no objection to transferring the nucleus thereof direct to the proposed new Traffic Branch of the Board of Trade, or, better still, the Traffic Board suggested by the Royal Commission. This branch of police work must of necessity come within the scope of the new authority, whose jurisdiction presumably will extend over the 700 square miles of the Metropolitan Police area, and the square mile of the city. The hugeness of the district to be dealt with, combined with the facts that about 140 local authorities are concerned in its rule, and that apart from tramways nobody has power to prevent cut-throat competition in passenger transport, such as until recently was the fate with motor cab enterprise, all go to demand exceptional treatment for London's traffic problem. With six county and county borough councils and thirty borough and urban councils all concerned in the government of the metropolitan area, the people of London lack the community of interest that distinguishes the provincial city. Indeed, there is open antagonism between county councils and borough councils on other matters besides that of transit, and it would result only in delay and perhaps hopeless muddle to entrust the licensing, routes, time tables, and numbers of stage carriages to the county and county borough councils. As is proposed, after an unfortunate transit promoter has run the gauntlet of the six authorities, he is to be consoled with the prospect of further delay and expense in appealing to the new Traffic Branch of the Board of Trade. The common sense of the Cabinet ought to enable them to avoid the pitfall which is entailed by this recommendation of the Select Committee. If the Government have any misgivings as to the need of London being for an entirely independent traffic body let them seek the advice of three or four experts representing the various interests. No question as to the readjustment of public vehicle taxation should be allowed to delay the setting up of the new authority.

---

An overhauling of the Acts and regulations which govern light and heavy motor vehicles is long overdue. Year by year the Motor Car Act, 1903, is placed at the end of each session in the list of expiring measures which are formally renewed, but this state of things would have ended before now but for the Road Board having been brought into existence to administer the funds accruing from the increased taxation of motorists and the placing of a duty on petrol three years ago. The private motorists' organisations are agreed upon the changes which they desire to see effected, the chief alterations being the raising of the present speed limit of 20 miles on roads removed from populated centres, and the abolition of various oppressive features. So far there has been no expression of the views of owners of motor vehicles engaged in public passenger and industrial work. While for these heavy vehicles there can be no objection to the continuance of the speeds of five, eight, and twelve miles an hour imposed by Orders made by the Local Government Board under the Motor Car Act, there are other directions in which need exists for guarding the interests of these

# MOTOR TRAFFIC.

users. An appropriate body to lead the movement would be the Society of Motor Manufacturers and Traders, who are free from any spirit of the rivalry which may prevail between the London users' organisation and the provincial associations that have come into existence during the last year or so. The best evidence of the need for the society to bestir themselves is shown by the decision of the Associations of Municipal Corporations, County Councils, etc., to approach the Government in order to urge amendments in the various Acts and Orders. The decisions arrived at by one of these bodies may be regarded as typical of the desires of the remainder. Under the Highways and Locomotives (Amendment) Act, 1878, the Local Government Board are to be asked to make a further order prohibiting the use of diagonal cross bars on wheels mentioned in the Act of 1878, and allowing wooden blocks to be used without springs; to repeal the whole of section 28 of the Act of 1878 which deals with the weight of locomotives and the construction of wheels; and to provide that the Board may from time to time deal with the matter by means of regulations.

---

It is asked that the Locomotives on Highways Act, 1896, and the Highways and Locomotives (Amendment) Act, 1878, may be amended so as to invest local authorities with powers to prohibit for a reasonable time heavy locomotive traffic on roads recently made up. By article 2 of the Heavy Motor Car Order, 1904, the expression "weight," in relation to heavy motor cars or trailers when unladen, is defined to mean the weight of the vehicle exclusive of the weight of any water, fuel, or accumulators used for the purpose of propulsion. The provision of a clearer definition of the expression "weight" is considered desirable, as it has been found in practice that parts of motor cars are frequently removed when such vehicles are submitted to the local authority for inspection and registration, the contention being that they are not essential parts of the vehicle. A regulation is to be sought that cars shall be made to conform with any new regulations that may from time to time be made, or be prohibited the use of the road, the period of six months' grace to be extended. It is also urged that each heavy motor should be weighed annually by some registration authority and a certificate given. For cars with tyres constructed of a hard or non-elastic material, it is proposed to reduce the speed limit of eight miles an hour to four miles, as is the case with traction engines. The association referred to is of opinion that much damage at present caused to highways would be avoided in that case. The substitution of two miles for half a mile is recommended in the regulation giving power to the officer of the registering authority to require a heavy motor car upon a highway to be driven upon any public weighing machine within half a mile of the highway for the purpose of testing its axle weight. A new regulation is proposed prescribing the fixing of flexible side mud or splash guards reaching to the ground on the outer sides of the wheels. Of the proposed alterations in the Motor Car Act, 1903, the one of most interest to manufacturers is the recommendation that separate identification marks shall be obtained from the Council of every county or county borough in whose area manufacturers or dealers have separate premises from which cars bearing manufacturers' marks are used.

## HEAVY MOTOR VEHICLES.

*By Geo. W. Watson, M.I.Mech.E., and D. S. Kennedy.

British manufacturers have led from the first in the matter of the construction and use of self-propelled vehicles for business purposes. It is within the power of the members of this Institution to maintain the position which established manufacturers have secured, and by careful and systematic attention to details, to reduce design to the simplest possible limit, and manufacturing costs to a figure which will preclude all possibility of the long-talked-of American invasion of industrial motors. It is the authors' intention in the course of the present paper to deal only with goods-carrying vehicles having a load capacity of three tons and upwards.

### Cylinder Capacity of Petrol Vehicles in Relation to Load.

A brief study of the tables in the paper giving data for eight different makes of petrol chassis will show that there is nothing like unanimity among manufacturers as to the correct size of engines in relation to load carried. The difference in the weights of the chassis is not sufficient to account for so wide a variation in engine dimensions. Either the smaller of the two engines is too small for regular service, or the bigger is too large. If the smaller one can effectively deal with the load, then the larger engine is obviously inefficient. Its power is being swallowed up by an ill-designed transmission gear, or the builder has fitted it because it was his nearest standard size for a chassis of that particular load capacity. In any case, the unfortunate user suffers, as his fuel and oil bills will undoubtedly be greatly in excess of those for an engine whose dimensions are better related to the gross load of the vehicle. It may be argued that the provision of a big engine reduces the risk of delays which might otherwise arise through lack of power, but it hardly seems logical to carry about an engine which is never called upon to exert its full power for more than one per cent. of its running time. It is the authors' experience that for a three-tonner, a four-cylinder engine with cylinders 4¼ in. in diameter, and 5 in. stroke, is capable of giving all the power that is needed, and with such an engine and a total gear ratio on top speed of eight to one, most of the running may be made through the direct drive, which is obviously the most efficient means of transmission. For loads of 4·5 tons the engine might with advantage have its cylinders increased to 4¾ in. in diameter and 5½ in. stroke, as, although the 4¼ in. by 5 in. engine will usually be found sufficient for all ordinary needs, the increased power, due to the larger dimensions, will ensure a higher point-to-point speed, and that is one of the chief factors to be considered in modern transport work.

In advocating engines of the two sizes named for the respective sizes of chassis under discussion, the authors have assumed that their normal speed is 1,000 revs. per minute when travelling on top gear at the maximum speed allowed by the Heavy Motor Car Order, with a compression pressure of between 70 and 75 lb. per square inch, which pressure they have found to give very satisfactory running and that degree of "controllability" which is highly desirable for the engines of commercial vehicles. A higher compression pressure would certainly increase the thermal efficiency, but, on the other hand, it would entail increased pressures on big-ends and main bearings, and greater stresses in all the transmission parts, and it is most desirable, in order to keep down the bill for running repairs to a minimum, that the maximum stresses due to the explosive effort, be kept as low as possible.

### General Design of Engines.

The general construction of an engine for commercial vehicle use should be such as to give the maximum degree of accessibility for all the wearing parts. In this respect it is interesting to note that, though the War Department have been criticised for their specification for subvention vehicles, that specification has caused manufacturers to pay more attention to the question of accessibility. One of the best examples of design, having regard to the accessibility of all its parts, with resulting general convenience, is that of the latest Maudslay engine, but the authors are not in entire agreement with the placing of the valves directly over the pistons in an engine for commercial use, as, apart from the likelihood of extensive damage to the pistons and other parts in the event of a broken valve falling into the cylinder, this construction involves the employment of a universally-jointed shaft and at least two pairs of skew gears for driving the cam shaft, and in the authors' experience a drive of this type quickly develops backlash and becomes noisy.

---

Extracts from a paper read before the Institution of Automobile Engineers.

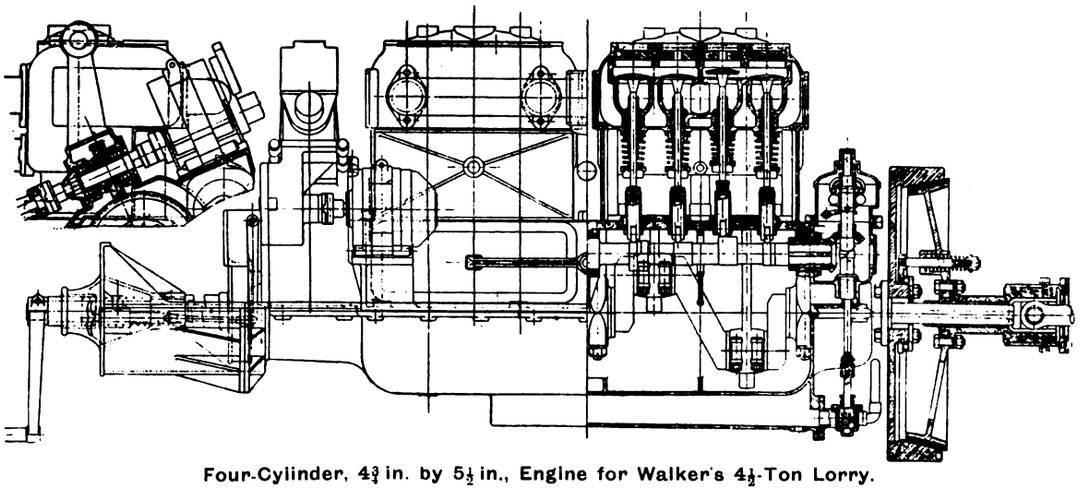
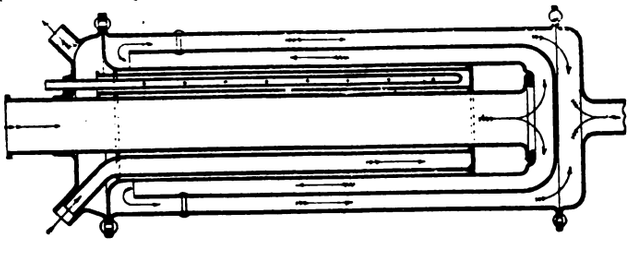
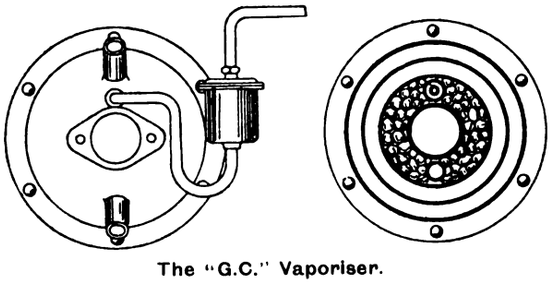
# MOTOR TRAFFIC.

Another engine, of which a drawing is given, is that now being built by Walker Brothers, Limited, for a subvention type chassis. Everything that needs to be taken into account for a commercial vehicle engine appears to have been considered, even to the matter of making permanent provision for the mounting and driving of an electric lighting dynamo, or, in its place, when desired, a reserve magneto for ignition purposes; notwithstanding this provision, access to the doors and the covers for the valve tappets and crank case has not been interfered with in the slightest degree. In this engine, a tray which forms an extension from the lower part of the crank case is carried forward so as to fill in the space between the front portion of the crank case proper and the cross member below the radiator, thus dispensing entirely with the need for an undershield below the engine, which always interferes with access to the big-ends. This tray carries the starting handle and the connection to the sliding cam shaft which provides for compression release. The authors are of opinion that for an engine of the dimensions given, namely 4¾ in. by 5½ in., it is essential that compression release cams be provided. This engine is also provided with a governor in conformity with the War Department's specification. The authors also dealt with lubrication and cooling.



Four-Cylinder, 4¾ in. by 5½ in., Engine for Walker's 4½-Ton Lorry.





The "G.C." Vaporiser.

### The Fuel Question.

The present time, when petrol prices are soaring higher each week, is a not inappropriate one for makers and users to consider whether they are altogether at the mercy of the petrol combine. Recent investigations would indicate that they are not. The use of benzol will undoubtedly be a feature of future development; enormous quantities of coal are daily being converted into coke. Only a small fraction of this coke is being produced in by-product ovens, yet the by-products are more valuable than the coke itselt. The chief by-product is coal tar, and the modern chemist has found in this evil-smelling and foul mixture a mine of most wonderful materials. 100 lb. of dry coal, if coked in a by-product oven, will yield about 68 lb. of coke, 15 lb. of gases, 10 lb. of ammonia water, and 7 lb. of tar. Members of this Institution are most interested in the tar, which contains something like 40 per cent. of light oils, and of these again some 65 per cent. are of the benzol class.

The adulteration of petroleum spirit has gone along slowly, but surely, and the grade has gradually become heavier, until what is to-day sold as petrol contains nearly one-half of the heavier fuels, such as paraffin, yet there appears to be no difficulty in the way of producing carburettors capable of dealing with this heavier fuel. So far have engineers gone in this respect that it is not too much to expect that in the near future they will go the whole way and use paraffin only, but it must not be thought that this change can be made without alteration in the carburettor, for such is not the case, and in fact many devices now on the market will not handle this fuel at all. The G.C. vaporiser is one of the few devices which have been given practical trial. This arrangement must not be confused with the ordinary type of petrol or paraffin carburettor, inasmuch as there is no attempt to atomise the fuel by passing air over it as it comes out of the jet. The whole purpose of the vaporiser is to gasify the fuel slowly, and not in any way to attempt mechanical atomisation. Owing to the large size of the vaporiser, it will readily be understood that there is always a large volume of fuel undergoing vaporisation, so that the action of the vaporiser is not sensitive to sudden temporary changes in the demands of the engine. As regards weight and space occupied, the apparatus takes up very little more room than an ordinary type of silencer, and as it incidentally performs the functions of a silencer, it may be said that the machinery space is no greater. It is, of course, heavier than a silencer, but that is of no consequence under ordinary conditions.

### Thomas Petrol-Electric Transmission.

After describing clutches and change-speed gear boxes, the authors said: Other means of obtaining torque-speed variation have been employed, with more or less success, some of them hydraulically, some electrically, and some by a combination of electrical and mechanical contrivances. Dr. Hele-Shaw has produced a hydraulic system which will undoubtedly find extensive employment in the future, but the authors prefer to leave Dr. Hele-Shaw to deal with his system in a paper which they believe is now under consideration.

There have been many electric and petrol-electric systems advanced from time to time, but, unfortunately, most systems, while meeting, to a great extent, the requirements of flexibility, fall very low in the efficiency scale. This is due chiefly to the fact that in most systems the entire load at times is transmitted electrically. In one or two systems a direct drive on "top" is provided, and when running on top a maximum of efficiency is obtained, but in all controller positions below top gear the whole load is transmitted electrically, and the total efficiency of the dynamotor and final-drive mechanism has been known to fall below 50 per cent.; such a low rate of efficiency is quite inadmissible for commercial vehicles.

Attention is drawn to the Thomas system, in which these conditions do not prevail, because at all times part of the power of the engine is

Digitized by Google

# MOTOR TRAFFIC.

transmitted mechanically to the road wheels, the remaining portion of the power being transmitted electrically for acceleration purposes. The latest development of this petrol-electric system consists of a petrol engine, a simple epicyclic gear, and two electrical machines, both of which machines may be run as dynamos or motors. There are also two clutches. Of the two sun pinions in the epicyclic gear the smaller is coupled direct to the armature of the first electrical machine, whilst the larger of the two sun pinions is coupled to a second electrical machine, which is permanently coupled to the driving axle. A 12-volt battery is carried on the vehicle, and when current from this is circulated through the windings of the first electrical machine it acts as a motor for the purpose of starting up the engine, the rear clutch, meanwhile, being disengaged. If, now, the forward clutch be disengaged and the rear clutch engaged, the planetary cage will be rotated at the same speed as the crank shaft, and as the planetary pinions mesh with the two sun pinions it follows that there must be a relative motion between the various pinions. The armature of the second electrical machine and the larger of the sun pinions, on account of the load on the road wheels, will remain stationary at first, and consequently the smaller of the sun pinions and the first electrical machine will be caused to rotate in a direction opposite to that of the engine, the first electrical machine then acting as a dynamo, and supplying current to the second electrical machine, and driving it as a motor.

In this way the epicyclic gear, having a differential effect, drives the armature of the second electrical machine and the cardan shaft partly mechanically and partly electrically. As the controller lever is advanced step by step, the strength of the field of the first dynamotor is varied, and its speed of anti-clockwise rotation gradually reduced until it comes to rest, momentarily, and then commences to rotate in the same direction as the engine; gradually the difference in speeds between the two armatures is reduced until they are both rotating at exactly the same speed, when the forward clutch is engaged, and the engine is then in direct mechanical connection with the final drive gear, all the electrical machinery being inoperative. Types of final drive, worm-driven axles, double-reduction gear axles, torque bars and radius rods, radius rods for chain drive, torque and thrust taper by springs, and enclosed cardan shafts, were next dealt with.

### Brakes, Front Axles, and Front-Driven Vehicles.

Front brakes, in the author's opinion, are a source of danger. If one or both back wheels are locked, the car will not necessarily skid or lose steerage way, but if the front wheels are locked all ability to steer is gone instantly, and the car will continue forward in the line of motion it was pursuing at the moment the wheels became locked. On a curve, for instance, if the front brakes are applied so that they lock the wheels, the car would go straight across to the other side of the road at a tangent to the curve it was formerly pursuing. Very careful compensation and extremely accurate adjustment have to be made, even in the case of well designed front-wheel brakes, to provide the maximum of braking effort short of locking the wheels. When these conditions are present the front-wheel brake is a success, but it is an interesting fact that makers who have tried front brakes have rarely fitted them a second time Many accidents with motor fire engines have been attributable to front-wheel skids as the result of fierce application of front wheel brakes, and the authors believe that all the fire engines owned by the London County Council Brigade which were fitted with front brakes have had them removed. Experiments are now being carried out by a number of makers and users in the matter of braking on one front wheel and one back wheel, the wheels being at opposite ends of the respective axles. This system of braking is known as diagonal braking, and it is probable that the experiments may bring to light many new factors relating to the design and construction of brakes for road vehicles.

The steering gear in most general use is that in which a worm and sector are employed, although a few makers have a screw and nut instead of the worm and sector. The latter type undoubtedly offers greater wearing surface, and should prove more generally satisfactory. Whichever type may be employed, it is necessary that provision be made for adjustment for wear, and that suitable thrust bearings be fitted, otherwise backlash will develop at an alarming rate, The steering connections also should be provided with means of adjustment. Many existing machines leave much to be desired in this respect. The steering arms should always be fitted with tapered spigot and socket, and not left parallel as is so often the case.

From time to time designs of commercial vehicles have been produced in which the drive is transmitted through the front wheels, the same wheels being also used to steer the vehicle: but, in this country, practically no headway has been made in the construction and use of this type of vehicle. French engineers have, however, given more serious consideration to it, and some interesting systems have been evolved. Views were given of the Renard-Latil Train (as illustrated in the issue of this journal dated March 13) and the Mass Tractor Fore Carriage; the former employs a gear drive throughout, with short cardan shafts; whilst the construction of the latter is much simpler, and the drive from the ends of the differential shaft in the change-speed gear box to the front wheels is taken through the medium of two side chains.

The authors have had no personal experience of either the construction or running of front drivers, although both of them have witnessed running tests with machines of this class, and they have been impressed by the ease with which front drivers can "get away" out of difficult positions on greasy pavements, and the almost total absence of skidding and side-slips. It is doubtful, however, whether the front-drive principle will ever be adopted, except for special applications where a very low platform is required, such as for furniture vans and vans for veterinary use, and for the conveyance of safes and other heavy goods. Almost any class of frame can be secured to the frame of the fore carriage, wood being preferable to all other materials on account of its ability to resist road shocks without fatigue. Existing vehicles, such as furniture vans, providing the back axle be perfectly sound, may readily be altered for attachment to such a fore carriage.

### General Arrangement.

Whatever special features there may be in the design of a heavy petrol vehicle, the general arrangement should be one that will permit the removal of any unit without disturbing any other parts, and for this reason the combined-unit form of construction, such as is now employed in many lighter vehicles, is not permissible. Every working part should be enclosed and protected from dust and grit, and between clutch and gear box, and between gear box and countershaft (if one is fitted, or between gear box and back axle), there should be suitable universally-jointed shafts which will eliminate all possibility of the imposition on the driving shafts of undue stresses which tend to throw the shaft out of alingment. A mistake is made in trying to secure a rigid chassis construction, whereas the design should be so arranged that the chassis may "work." Everything must be so mounted that distortion, due to uneven road surfaces and bad loading, will not subject any part to undue strain.

### Tyres.

After dealing at length with steam vehicles the paper proceeded: The solid-rubber tyre has been a very powerful factor in the evolution of commercial vehicles, and at the present time the use of such tyres has become an economic necessity; yet it was not always so. In the earlier days of the development so small a vehicle as a 30-cwt. petrol van cost, for rubber tyres, 8d. per set per vehicle-mile for country service. In considering the class of tyres to be fitted on motor vehicles, we must be guided largely by the nature of the work on which the vehicle is to be employed; generally speaking, however, for service in this country, the first and foremost consideration is that of silence of running, and when a vehicle is to be employed on night service, such as many of the municipal wagons and those employed on mail and carrier service, the use of solid-rubber tyres is absolutely necessary. Steel-tyred wheels are almost exclusively used for the slower-moving steam vehicles. Generally speaking, when a vehicle is fitted with rubber tyres it may be driven at greater speeds than a steel-tyred machine, and yet the cost for mechanical maintenance can be reduced It is the experience of the authors that where steam vehicles originally fitted with steel tyres have been converted to take solid-rubber tyres, their costs for upkeep have been decreased by a greater amount than the increased cost for tyres. In one or two well-known cases, such as the old Thornycroft steamers owned by the City of Westminster Corporation (vehicles which had given between eight and ten years of service on steel tyres) have been given a new lease of life by having their wheels shod with rubber, and, notwithstanding their great age, the cost for mechanical maintenance is lower now than it was for their first year of service.

The weekly mileage of a commercial vehicle is a direct index of its earning capacity, and, whilst many 5-ton steam wagons, running on steel tyres, do not average more than 200 miles per week, there are in London, Lancashire, and various other parts of the United Kingdom many 5-ton petrol lorries which keep up an average of 400 miles per week on solid-rubber tyres. At the present time it is fairly safe to reckon that under average conditions the cost per set of solid-rubber band tyres per vehicle-mile will work out somewhat as follows: 1·5d. for a 3-ton petrol wagon, 1·75d. for a 3-ton steam wagon, 2·5d. for a 5-ton petrol wagon, 2·75d. for a 5-ton steam wagon. Or, put in another form: For a gross load of 6 tons 1·5d. per vehicle-mile, 7 tons 2d., 8 tons 2·25d., 10 tons 2·50d., and 12 tons 2·75d. As regards the sections of tyres fitted by motor manufacturers, it will generally be

Digitized by Google

# MOTOR TRAFFIC.

found that they select sizes and sections of tyres that are probably correct according to the tyre makers' catalogue, but it should be borne in mind that each section of tyre is constructed to carry a certain weight, and if it is assured that that weight will never be exceeded, the selection may prove a very satisfactory one. It not infrequently happens, however, that a vehicle is accidently or, for a matter of convenience, occasionally overloaded by several cwts.; in some cases, even, users are in the habit of doing this regularly, a practice which is greatly to be deprecated, and motor manufacturers would be well advised to fit such sizes of tyres as would permit of a reasonable amount of overload without serious damage, a practice which some vehicle makers have already found desirable.

The alignment for parallelism of the front wheels, of the back wheels, and of the axles respectively, should be checked from time to time, as frequent collisions with the kerb, due to side-slips, etc., and maladjustment of steering cross rods or radius rods, often lead to the alignment being incorrect. The authors need say no more on this subject than to remind members of this Institution that, taking a 32-in. wheel as a basis of argument, if a pair of such wheels be 1 in. out of alignment, a not infrequent amount, the persistent side-slip, due to this lack of alignment, amounts approximately to 3 per cent. of the travel of the car; that is to say, if a pair of 32 in. wheels be set up on an axle of indefinite length, on which they are free to approach or recede from each other, and then rolled forward, it would be found that after travelling in a forward direction for 100 miles the two wheels would be three miles apart. This movement on the axle is not permitted on any motor vehicle, because the construction keeps them at a fixed distance apart; there must, therefore, of necessity be three miles of side-slipping for every 100 miles of forward travel. This lack of alignment is a frequent cause of excessive wear on tyres. The authors draw the attention of tyre manufacturers to the real necessity of standardisation, especially as regards the bands, and to a lesser degree resiliency, and it is also desirable that a standard load unit be adopted.

### Electric Lighting of Vehicles.

Adverting to the methods and importance of lighting, the authors said: Electric lighting will come into far more extensive use than hitherto on commercial vehicles. Up to the present time, with but two or three notable exceptions, the lighting equipment of a car has been treated as an accessory, instead of having provision made for it in the original design, but if a vehicle is to be worked commercially there must of necessity be a considerable amount of night driving, and under the circumstances the lighting equipment is just as much an essential part of the complete outfit as is the ignition system, the carburettor, or any other component of the vehicle. One notable exception to this common practice of making the equipment separate is afforded by the Thomas transmission system, to which further reference is made elsewhere in the paper.

### Steam or Petrol?

While the authors have no desire to be dogmatic as to the future development of these two sources of motive power, after several years' experience of petrol and steam engines, they find no reason for favouring the former in preference to steam, except in special cases. Petrol has many minor advantages, but it also possesses disadvantages. The essential requirements of a good road motor are simplicity and reliability, and in most cases it must be capable of withstanding a considerable amount of rough usage. With regard to simplicity, there can be little question that steam still holds the field; it is on the question of reliability that the petrol enthusiast raises the challenge, but he must admit certain facts at the outset. Whereas a steamer can continue to give out its full power long after it has developed a mechanical defect, a petrol machine is dependent for its full power upon the mechanism being in perfect order, as the slightest defect will at once produce a serious loss in power, which no extra expenditure of fuel will make good. A petrol machine only works economically at about seven-eighths full load, and the question becomes one of either using a large engine to work uneconomically, or a small engine with an undesirable multiplication of gears. A steamer will continue to perform its daily work with wonderful regularity, and its defects grow gradually and do not require the same urgent attention as is the case with a petrol machine; this is a very great point to the owners. Whichever type of vehicle be employed, the best results can only be obtained if the control arrangements be such as to permit of long periods of working without causing undue fatigue to the driver, whose comfort, unfortunately, was the least considered factor in the construction of early vehicles. In this connection, the authors would emphasise the necessity of affording protection for the driver, in the form of side-doors, hoods, and screens. The paper was illustrated by numerous diagrams and photographs.

## THE USE OF BALL BEARINGS.

Within the last few years some remarkable developments have taken place in the application of ball bearings to various classes of machinery. The first great successful use of the ball bearing was in connection with bicycles and tricycles, and since then the use of this class of bearing has been extended to larger and heavier machinery. To some extent experiments have been made in the case of tramcars, while motor cars have now in very many cases ball bearings embodied in their mechanism. The drawbacks of plain bearings are, of course, well enough known, involving as they do regular attention, oiling, rapid wear, risk of running hot, and renewing. It has been calculated that in some cases the frictional loss can be reduced by 90 per cent. by the application of ball bearings.

For some time after the bicycle became a general success engineers considered ball bearings unsuitable for anything except small parts of light machinery, running at high speeds, and it would appear that one of the ideas in using them at all was to save space taken up by bearings of the ordinary type. A great deal of experimenting, however, went on with ball bearings for heavier loads and higher speeds. Some of the manufacturers now claim that they are able to offer a ball bearing for any duty and fitted to work under almost any conditions. The importance of correct housing of the bearing can be easily understood, and a great percentage of failures has been due to bad mounting. Almost every ball bearing manufacturer can prepare drawings showing the correct method of fitting and housing for any particular case. In the effort which has been made to extend the use of bearings of this kind, pains have been taken to point out the advantages to be derived from ball bearings. They are almost frictionless, and their lubrication is reduced to a minimum. A little oil is necessary to keep the balls and their races from getting rusty. The absence of friction means corresponding absence of wear, and such bearings are accordingly of great value in connection with the drives of motor cars, and also for gear boxes.

The types of ball bearings manufactured by the Skefko S.K.F. Ball Bearing Company, at Luton, are the result of minute scientific investigations. The bearings are designed so that the slightest deflections in the shaft, either permanent or occasional, are automatically taken up without any risk of damage to the bearing or loss of efficiency. They are claimed to be the most carefully designed, practical, economical, and reliable bearings on the market. The makers employ only cast-steel of the very highest quality, produced from pure Swedish iron and hardened and tempered by a special process involving five distinct operations. These bearings are also manufactured on the self-aligning principle. The company is the English branch of the S.K.F. Ball Bearing Company, of Gothenburg. Particulars of all their radial and thrust bearings, together with useful information regarding the design, fitting, and use, can be obtained on application at the chief offices at Luton.

## MOTOR OMNIBUSES IN INDIA.

The Bangalore District Board has discussed the relative cost of motor road traction and tramway traction between Bangalore and Kunigal. It was pointed out that on the motor car services in South India now being run on a commercial scale, the cost per mile had averaged 12 annas for an average load of three tons either passenger or goods, or four annas per ton per mile on good roads. In the present state of the roads in Mysore the average rate would be five annas a ton a mile. A tramway from Bangalore to Kunigal *via* Magadi would cost five or six lakhs, whereas the cost of installing a motor service would be Rs. 50,000, representing the cost of three cars at Rs. 15,000 each, and three trailers of one ton capacity each. The board resolved in favour of a motor service, and it was resolved to approach the Government for a loan of Rs. 50,000. An anna is equal to one penny, and rupees multiplied by 2/30 give pounds sterling, one of which is equal to 15 rupees.

"Heavy Motor Vehicles."—In 1905, when the Tramway and Railway World first began to devote a portion of its illustrated issues to public passenger and industrial motor vehicles, there was occasionally some difficulty in finding matter to fill the pages devoted to this feature. Nowadays the difficulty is to compress into the allotted space the number of subjects that call for treatment. It is on this account that we have had to hold over until this issue our excerpts from the paper on "Heavy Motor Vehicles," which was read some time ago before the Institution of Automobile Engineers by Messrs. Geo. W. Watson and D. S. Kennedy.

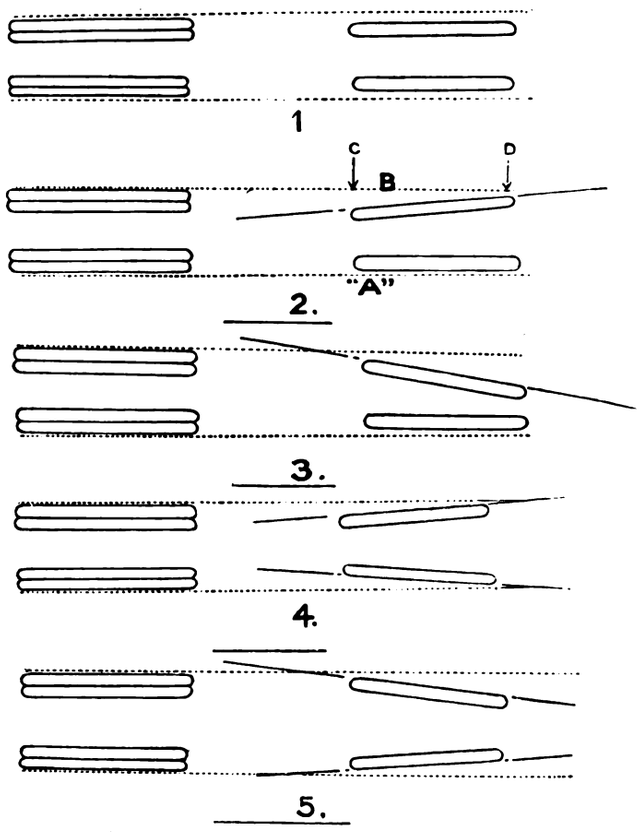
## WHEEL ALIGNMENT AND CARE OF TYRES.

In the outline illustrations given on this page, Fig. 1 shows wheels in correct alignment. Figs. 2 and 3 show the two directions in which the near-side front wheel may be out of alignment in relation to the back wheels. Of course, the off-side wheels may be similarly affected, and generally, under running conditions, the error in alignment is distributed between the two front wheels, as illustrated by Figs. 4 and 5.

Error in alignment generally lies in the front wheels, and is usually caused by wear or strain of the steering rod or connections. Occasionally the fault is found in back wheels, due either to wear or exceptional shock. Errors in alignment can be readily detected by lining up the front and back wheels on one side of the chassis, as at **A** Fig. 2; the application of a straight-edge, as at **B** Fig. 2, will at once disclose the error by showing the variation in distance between the points of the wheels and the straight-edge at **C—D**.

So important is this matter that the Dunlop Rubber Company, Limited, announce that customers' vehicles may be tested for correct



alignment of wheels at any time without charge, if brought to the company's solid tyre departments, Manor Mills, Birmingham, or Priory Works, Kilburn, London, or any of the company's depots. The exceptional wear of tyres due to running wheels out of alignment is unmistakeable, the tread of the tyres having the appearance of being cut away with a rough file. A very large mileage can be obtained from a solid tyre without giving it any attention, but when it is understood how vastly greater is the mileage to be obtained from solid tyres which receive reasonable care and attention, no user will fail to take the very trifling precautions which are necessary to ensure maximum mileage.

Whilst a tyre of a certain section may give good service if fitted to a vehicle running mainly on best city roads, to get equal service on moderate provincial roads a considerably larger section tyre ought to be fitted, and this is desirable not only to ensure satisfactory tyre service, but to sufficiently protect the engine and chassis against the greatly increased vibration and shocks due to the inferior road surface.

Other important points to be borne in mind are—

Use tyres of ample section, having regard to the nature of the service.

Avoid running tyres over loose stones, and when this is not possible, drive *slowly*; the best rubber tyre ever made can be destroyed by being driven *rapidly* over loose stones.

Carefully look over all tyres after each day's service, and remove any stones or other foreign matter embedded in the tyres.

Avoid locking the wheels with the brakes. Occasionally tyres are so badly skidded as to grind down some part of the steel band.

See that the tyres are not allowed to stand upon oily floors, and that no oil is allowed to get into contact with the rubber. Oil rapidly destroys rubber.

Jack up a vehicle when out of use for any extended period. The whole weight of a vehicle should not be carried by one point on the tyres, as would be the case in a vehicle used for season traffic and put up for some months in succession.

## COMMER CARS IN VENTNOR.

Ventnor Road Cars, Limited, have inaugurated a service of single-deck motor omnibuses which in their regular daily service climb a gradient of 1 in 5. These machines have been supplied by Commercial Cars, Limited, and, as will be seen from our illustration, have a most pleasing appearance. The chassis is fitted with the "Commer Car" standard 32-H.P. 4-cylinder engine, 110 mm. bore by 140 mm. stroke.

"Commer Car" Omnibus in Ventnor.

The speed control enables a variation from 250 to 1,250 revs. per minute. Special gearing has been installed in the patent gear box, and this ensures the regularity of the service on one of the worst gradients in this country. The omnibus is arranged to seat 25 passengers, and is similar to those recently supplied to the Cheltenham and District Light Railway Company.

## ROAD BOARD APPOINTMENTS.

The Road Board have appointed Mr. Henry Percy Maybury, M.Inst.C.E., the county surveyor of Kent, as chief engineer to the Board. Colonel Crompton, C.B., will continue to act, as he has hitherto done, as consulting engineer. Mr. Maybury will commence his new duties as soon as the Kent County Council fill the vacancy in the post of county surveyor, which will probably be in the month of November next. The Road Board have also added to their Engineering Advisory Committee Mr. E. Parnell Hooley, the county surveyor of Notts., and Mr. Alfred Dryland, the county surveyor of Surrey. Lord Montague, of Beaulieu, has been appointed a member of the Board in place of the late Sir Charles Rose.

POLACK TYRE MILEAGES.—The set of tyres removed for exhibition purposes from a 2-ton "Commer" Car mentioned in our report of the recent motor vehicle show at Olympia, had previously covered 27,000 miles, the figures 2,700 shown in our report being a printer's error. We understand that the lagging method of fitting Polack tyres has been in operation for some years with complete satisfaction.

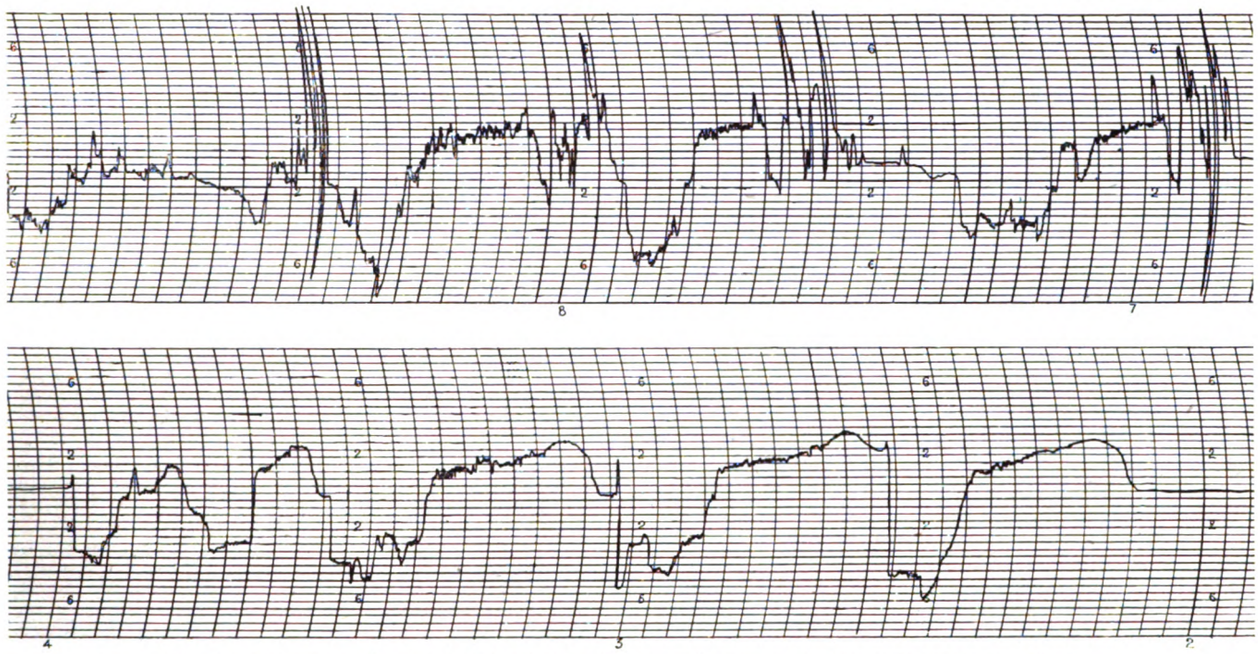
# MOTOR TRAFFIC.

## TRANSMISSION STRESSES.

By means of a Wimperis accelerometer the appended records have been taken in order to compare the acceleration and retardation effects of changing speed and braking on a gear-driven omnibus and a 40-H.P. Tilling-Stevens petrol-electric omnibus. The records show the acceleration or retardation in feet per second per second, above and below the zero line respectively. The speed changes of the gear-driven vehicle are indicated on the upper record, and of the petrol-electric vehicle on the lower one. The object of the records, which were made under identical conditions on the same road and on the same day, is to determine transmission stresses. It is calculated that the intermittent accelerations on the gear-driven vehicle, exceeding 8 ft. per second per second shown by the record result in a stress at the rim of the road wheels of at least 560 lb. per ton, while in the Tilling-Stevens petrol-electric machine in no place is the acceleration shown to be more than $3\frac{1}{2}$ ft. per second per second, the transmission stresses in this case being less than 245 lb. per ton on the rim of the road wheels.



Charts of Acceleration and Retardation for Gear-Driven and Petrol-Electric Omnibuses.

## "COMMER CAR" OMNIBUSES FOR NORTH WESTERN RAILWAY.

The six "Commer Car" omnibuses shown in the accompanying illustration are a portion of the fleet used by the London and North Western Railway Company for the conveyance of passengers and luggage from Euston to all parts of London. These machines, which are owing to their convenience extremely well patronised, can carry 10 passengers with 15 cwts. of luggage. They are nearly as handy in traffic as taxi-cabs, and their speed may be equally great.

In addition to these small motors, the North Western Railway have 20 other "Commer" cars, most of which are used in tourist centres in North Wales. They are 32 H.P. capacity and carry 23 passengers. In the summer and autumn months a great and increasing business is done with these vehicles, owing to the opportunities they give for seeing the country.

"Commer" Cars Used in London by the London and North Western Railway.

BATH TRAMWAYS NEW MOTOR SERVICES.—The Bath Electric Tramways Company have decided to increase considerably their motor service, and have organised a system of extended tours to South Wales, covering some 760 miles in six days, at an inclusive charge with first-class hotel accommodation of six guineas. The service will be maintained by a fleet of motor chars-a-bancs, and Commercial Cars, Limited, have received a further order for six of these vehicles, making in all 16 machines of this type which the Luton firm have supplied to the company.

SOUTHPORT OMNIBUSES.—In a paragraph of our issue of August 14 in regard to motor omnibuses of the W. A. Stevens petrol-electric type, the name of the town council was erroneously given as Southend instead of Southport.

TRAMCARS OR OMNIBUSES FOR NUNEATON?—At a meeting of the Nuneaton Council, a letter was received from the local Co-operative Society urging the desirability of securing a tramway service. It was pointed out that the establishment of an omnibus system would involve an Act of Parliament. Consideration of the subject was deferred.

## WHAT BECOMES OF OLD CARS.

The accompanying illustration shows one use, at all events, to which old motor cars may be put. The car in question is a 35-H.P. Daimler, and the story connected with it is to the following effect: The car was originally purchased by a Mr. Leonard, of Vancouver. Subsequently it was employed as a stage carriage at Sooke, Vancouver Island. A year later it came back to Vancouver, and was put on to local work there for some time. Eventually, it was bought by the Western Power Company, and shipped to their power-station at Stave Lake. There they removed the rims and tyres from the wheels, replaced the front axle by a rigid one, and fitted flanged rims to the old wooden wheels, so as to make the vehicle suitable for running on a railway. While

**Road Car Applied to Railway Use.**

this was being done the radiator was destroyed, so there was constructed instead a vertical pipe radiator with ¾ in. iron pipes connected underneath with 1¼ in. pipes. The tonneau of the body was removed, and two long board seats were substituted, like omnibus seats.

The car is used for a trip of about six miles, on a railway of standard guage, with 40 lb. rails, having gradients of 6¾ per cent., and curves of 20 ft. radius. Guard rails are used on the curves. The vehicle can carry about 13 passengers, if four stand on the running boards. The trip can be made in nine minutes, but it is reported that 12 minutes is hair-raising enough. The charge is 25 cents per head, and extra for luggage. The company say that the car is quite satisfactory, and they run it as often as they can to save using a locomotive, which uses ½ ton of coal per trip, and requires three men to work it.

## A NORTHAMPTON PROBLEM.

A problem now before the Northampton local authority is whether traffic facilities shall be extended by means of tramways or omnibuses. At the last meeting of the Council the town clerk reported that he had received several communications on the question of the extension of the tram lines to Far Cotton from Northampton Property Protection Society and the Ratepayers' Association. The last named called upon the Council not to lay tram lines until they had experimented with omnibuses, which they could do during the period of grace allowed them by the Act of Parliament. Councillor Lewis, chairman of the Tramways Committee, remarked that tramcars were superior to omnibuses in the matter of safe travelling, and they were more economical. The cars could be run at 1d. per car-mile less than the motor 'bus, and on the Far Cotton service that would mean a saving of £400 to £500 a year. Since the figures of the committee were prepared the price of petrol had greatly increased, and the comparison of the omnibus with the tramcars was the worse to that extent. The immense success of the motor omnibus in London led people to wrong conclusions as to its utility in other centres. The 'buses in London were successful for reasons peculiar to London, for the tramways did not there touch the centres of the traffic. The mobility of the omnibus made it useful, and the committee had considered whether there were any routes for it within the borough boundaries not covered by the tramway system.

ROAD MATERIAL TO WITHSTAND MODERN CONDITIONS.—The Works Committee of Islington recently visited all the East London boroughs in search of a road material which will withstand modern conditions. The committee inspected many different materials.

## LONDON MOTOR TRAFFIC.

THE POSITION AND OPINIONS OF MR. W. W. BEAUMONT.

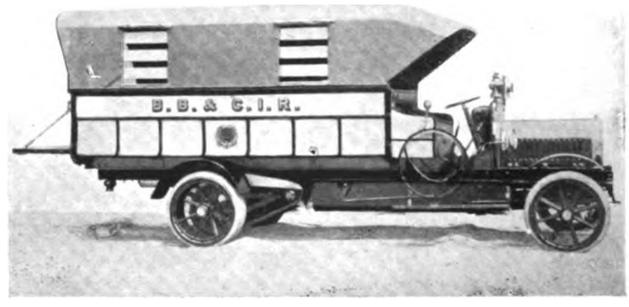
In the House of Commons, a few days before the close of the session, Mr. FRED HALL (Dulwich—U) asked the Secretary of State for the Home Department if Mr. W. Worby Beaumont, who acted as adviser to the Commissioner of Police in regard to the construction of licensed motor vehicles, was also consulting engineer to any omnibus company running licensed vehicles in the Metropolitan Police area; if so, the dates when he took up these respective positions; what were the duties he performed in regard to motor vehicles, and did these duties include the supervision of tramcar design; if Mr. Beaumont had expressed any opinion as to the advantages or disadvantages of tramways as a means of urban street transit; and, if so, whether this opinion was expressed in his capacity as adviser to the police or to the omnibus companies.

Mr. MCKENNA replied: Mr. Worby Beaumont has been adviser to the Commissioner of Police in regard to the construction of licensed motor vehicles since November, 1905. His duties, which are advisory only, do not include the supervision of tramcar or of omnibus or of cab design, but he is consulted on technical engineering points affecting the construction of cabs and omnibuses, and occasionally of tramcars. I believe that Mr. Beaumont has for many years given public expression to his personal views as to the advantages or disadvantages of various means of street transit, but these are his personal views only, and he has not been asked to express any opinion in an official capacity. Mr. Beaumont at the time of his appointment as adviser to the Commissioner of Police was, I believe, already consulting engineer to all the motor omnibus companies then plying in London, and also to various tramway undertakings in London and elsewhere.

It will be remembered that the Select Committee considered that the technical adviser to the Chief Commissioner should be an independent official.

## MOTOR PARCELS VANS IN INDIA.

The delivery of a 3-ton motor van with a 4-cylinder engine of 32 H.P. by the Albion Motor Car Company of Glasgow, to the Bombay, Baroda, and Central India Railway Company, has increased the number of motor vans now in this company's service to four. The latest vehicle, fitted with solid tyres (twin on rear wheels and single on the front), has a speed of from 12 to 15 miles an hour when fully loaded. The body is tastefully painted in the company's standard coaching stock colours, viz., cream panels with mouldings picked out in dark olive green. Since the opening of the through Nagda-Multra route this railway has secured a large portion of the fruit traffic from the Punjaub, and the four vans now in use are barely sufficient to cope with this traffic during the season.



**Motor Van—Bombay, Baroda, and Central India Railway.**

ROAD MAINTENANCE.—Resolutions were passed at the annual conference of the Urban District Councils' Association at Llandrindod Wells, suggesting that motor omnibus companies should make a contribution towards the cost of road maintenance.

## ROAD BOARD'S THIRD REPORT.

The third annual report of the Road Board has been issued from the Treasury in the form of a White Paper. It is stated that the total receipts for the year ended March 31, 1913, from carriage licence duties, motor spirit duties, and interest on investments and loans, amounted to £1,229,003, and the net payments to £467,069. For the whole period from 1911 to June 30, 1913, the receipts amounted to £3,556,995, making, after a deduction of £31,000 for administrative expenses, a balance of £3,525,995 available for grants and loans. During the year applications for advances were made to the extent of £1,508,272, £1,206,951 being for improvement of road crusts, £190,288 for road widenings and improvement of curves and corners, and £61,769 for the reconstruction and improvement of bridges. Grants indicated amounted up to June 30 last to £2,596,752, and loans to £838,481, leaving £90,762 as the net receipts in excess of commitments. The grants and loans made fell short of the grants and loans indicated by £1,613,028 up to March 31, and by £1,960,440 up to June 30. The total grants up to March 31, 1913, were £1,130,722, whilst the amount paid under the grants was £632,541, the balance unpaid being £498,181.
